EARLY TARES. Messrs. Sutton, of Reading, have sent to us the following extract of a letter, received from the Rev. Anthony Huxtable:—"Allow me to call your attention to a remarkable variety of early Vetch, which I picked yesterday, at my Hill Farm, 600 feet above the sea, sown at the end of the first week in October, and a full month in advance of the other so-called early Vetches, which were sown about a week before them. It appears to me so valuable a kind that I have sent a sample to the Council of the Agricultural Society. Unfortunately I have only one acre, and shall want more than this for my own use; but I have apprised you of this circumstance that you may obtain some seed if possible." In the report of the Council meeting, at page 428, Mr. Huxtable's communication on this subject will be seen. We have received full grown pods of this variety from Messrs. Sutton—the seed sown on October 28, and the pods pulled, we presume, in the month of June, grown by Mr. Davis, of Mainhall, near Blandford, from whom Messrs. Sutton obtained them.

POTTED BUTTER: *J. S.* The following is Mr. Ballantine's recipe, "Quarterly Journal of Agriculture," Vol. I., p. 26:—The butter is taken warm from the churn, and it is an invariable rule never to work it or dip it into water when intended to be salted. The dairymaid puts it into a clean tub, previously well rinsed with cold water, and then works it with cool hands, till the milk is thoroughly squeezed out. Half the allowed quantity of salt is then added, and well mixed up with the butter, and in this state it is allowed to stand till the next morning, when it is again brought up, any brine squeezed out, and the remainder of the salt added. It is then potted in kits, which, when full, should be well covered up, and placed in a cool dry store. A small quantity of salt is usually sprinkled on the surface. The quantity of salt used is half a lb. to 14 lbs. of butter.

WHEAT: *Lockerby.* The ears you have sent have been forwarded to "M. J. B." The flowers not having set, and the consequently defective state of the ear, are probably owing to cold wet windy weather during flowering. It is very often observed.

WHEAT CROP: *M W.* On your fifth and sixth questions we have merely to say that we are not aware of any difference in the expense of last year as to the harvest of spring and autumn Wheats. You are aware that there are many Wheats sown in March, such as Talavera, &c., which get the name of spring Wheats, but they must not be confounded with the true bearded spring Wheat. The practice of spring sowing has extended, not because spring-sown Wheats yield generally better than autumn-sown Wheats—for the contrary is the case—but as a matter of necessity arising out of the extension of Turnip growing and sheep feeding, under which the land is not ready for the seed till after winter.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.
Contracts given for Heating.

FISHING NETS.—A 20-yard Drag Net, with purse complete, 2*l.* 10*s.* A Single Walled Drag Net, any length and depth, 1*s.* per square yard. Casting Nets, complete, 1*s.* to 1*s.* 6*d.* per yard, measured round the lead line. Fine Nets, any size, 1*s.* per square yard. Complete Minnow Nets, Eel Nets, and Landing Nets equally cheap; all warranted first-rate quality and workmanship.—At W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Islington, London; and at the Crystal Palace, Sydenham.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „ ...	9 „	6½ „
2-inch „ extra strong „ ...	12 „	9 „
1½-inch „ light „ ...	8 „	6 „
1⅝-inch „ strong „ ...	10 „	8 „
1⅝-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.
Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.
GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised.
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard

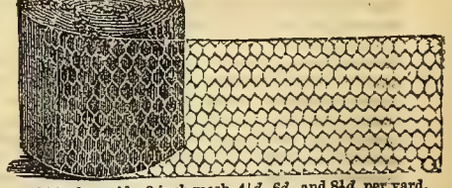
36 in. „ 2 in. „	10½*d.* „	7½*d.* „
48 in. „ 2 in. „	1*s.* 2*d.* „	10*d.* „

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.

This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

BALANCE OF FACTS IN FAVOUR OF

RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.

"Early Court, Reading.

"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL.

"Messrs. RICHMOND & Co."

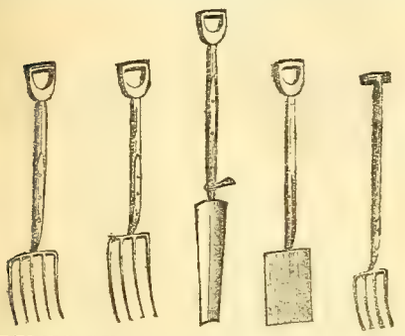
Address—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

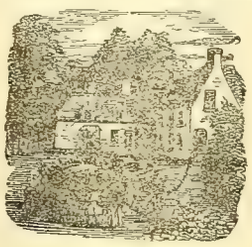


MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, ETC.

JAMES LYNE HANCOCK'S VULCANISED INDIA-RUBBER TUBING is now manufactured especially for the above purposes, and is of greater flexibility than any other description of hose or tubing. It is also manufactured to resist great pressure, suitable for attaching to the mains of water works or to tanks, or water butts of high elevations. WATERING HOSE fitted up with brass joints, branches, stop-cocks, roses, and jets complete. Vulcanised India-rubber suction pipes for pumps any length or size to order; HOSE for brewers' use, fire engines, &c. VULCANISED INDIA-RUBBER WASHERS, for Steam and Water Joints, and VULCANISED RUBBER in sheets of any size and thickness. Solid vulcanised India-rubber Tubing and Cord, for the joints of glass-doors, sashes, frames, &c.—Prices and every information may be had on application at the Manufactory, Goswell Mews, Goswell Road.



THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	*s.*	*d.*
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

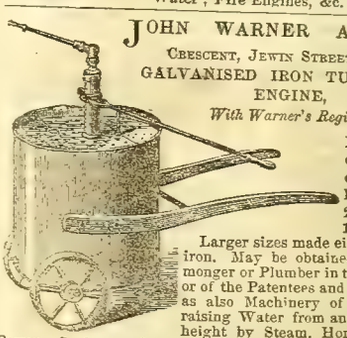
Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Conservatory Pump, with Warner's Registered Spreader, 27*s.* 6*d.*
No. 32.
Garden Engine, with Warner's Registered Spreader and Wrench 8*l.* 8*s.* with iron pail, 3*l.* 12*s.*
No. 11.
Patent Conservatory Pump, with Warner's Registered Spreader, 2*l.* 13*s.* with iron pail, 3*l.* 6*s.*
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain who on application will forward wholesale and retail prices.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

SAMUELSON'S IMPROVED
GARDNER'S TURNIP CUTTER.

MR. SAMUELSON having purchased the late Mr. GARDNER'S Works, has made it his study to maintain the quality of this valuable implement, more especially of the Knives, which are unequalled by the numerous imitations which have been attempted. Since the last meeting of the Royal Agricultural Society, a valuable addition has been made by Mr. Samuelson to the original GARDNER'S TURNIP CUTTER, viz., a screening apparatus, which separates the dirt from the cut roots, thereby preventing Scouring in the Sheep and Lambs.

CHAFF-CUTTERS, CORN-CRUSHERS, and Food-preparing Machines of every description.

SAMUELSON'S IMPROVED BUDDING'S LAWN MOWER, American and Atmospheric Churns, &c.

SAMUELSON'S PATENT FORKING, or DIGGING MACHINE.

Upwards of seventy of these Machines are already at work in various parts of England, the Continent, the Sugar Colonies, and Australia, and the number is daily increasing. It is now an acknowledged fact that by the use of the Forker the advantages of hand-digging can be obtained at a tithe of its cost, and a tilth has been got with it this season when the ground was in such a state that no combination of the ordinary implements could have accomplished it. For all Crops requiring a deep or a fine seed bed, nothing can equal the operation of the Forker.

TESTIMONIALS from numerous Agriculturists of eminence who are using it, may be had on application.

B. SAMUELSON, successor to the late J. Gardner,

Britannia Works, Banbury; Stand No. 12, Royal Agricultural Show, Lincoln; and Stand No. 38, Agricultural Department at the Crystal Palace, Sydenham.

No. 14 „ 30 „	45	„	...	5	18	

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and promptness, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place Pimlico, London.

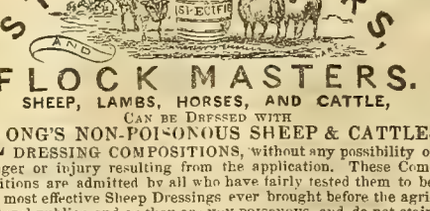
Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London No Agents. All orders are particularly requested to be sent direct.

IMPORTANT
TO



FLOCK MASTERS.
SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets containing full directions for use, and copies of the strongest Testimonials ever accord d to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

M'CORMICK'S PATENT REAPING AND MOWING MACHINE.

☞ CAUTION TO USERS, PURCHASERS, AND MANUFACTURERS!

Parties are hereby cautioned against "Making, Using, Exercising, or Vending," any Reaping Machines which infringe on M'Cormick's Patent without a licence from him, *as proceedings at law will be instituted against all such as infringe.* The main features of M'Cormick's Machine consist in zig-zag serrated cutting blade, spear-head shaped holding fingers, and gathering reel.

The sale of these Machines, in the United States, for the present harvest, has been upwards of 1500, their efficiency and superiority being established by the use of thousands for several years.

Machines containing all the *patented improvements* adapting them to the cutting of *grain* or *Grass*, and guaranteed to perform well, may be had on application to Mr. M'CORMICK'S Agent, D. C. M'KENZIE, 166, Fleet Street, London.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application

NURSERY AND SEED BUSINESS.
ESTABLISHED IN THE YEAR 1819.

TO BE LET, with immediate possession, the old-established NURSERY at Taunton, Somerset, for some time past in the occupation of Messrs. Macintyre and McIntosh. The Grounds and Stock are in excellent condition, moderately rented, and are well worthy the attention of any person wishing to carry on the business. If required, the quantity of ground may be reduced.—For further particulars, apply to Mr. JOHN MCINTOSH, Lone Bridge, Taunton; or to Mr. YOUNG (the proprietor), Elm Cottage, Taunton.—July 15.

LODGE FARM, BLECHINGLY, SURREY.

TO BE LET, from Michaelmas next, with the Sporting thereon, all that conveniently arranged Farm called the LODGE FARM, situate at Blechingly, Surrey, within an easy distance of the Reigate and Croydon Markets. The Farm comprises a Farm House and compact out-buildings, all in good repair, and 194 acres of land, well farmed and in good condition, of which about 30 are pasture.—To view the Farm, apply to Mr. JAMES EDWARDS on the farm, and for further particulars, of Mr. JAMES WICKENS, No. 1, Chandos Street, Cavendish Square, London.

SIDBURY AND SALCOMBE REGIS, DEVON.

TO BE LET, for a term of 10 or 14 years, from Michaelmas, 1854, all that compact ESTATE, lying within a ring fence, called Middle and Lower Chelson, situate in the parishes of Salcombe Regis and Sidbury aforesaid, comprising 372 Acres of Arable and Pasture Land, with newly-erected and commodious Farm Buildings, now and for some years past in the occupation of the owner. This Estate, adapted to the growth of Corn and Breeding of Sheep and Cattle, has been thoroughly under-drained, new fenced, and improved at a considerable outlay during the last seven years by the owner, and is now in a high state of cultivation, with the necessary preparation made for the ensuing root crops; and would be found an advantageous opportunity for an active and enterprising tenant. The Estate, situated near the village of Sidbury, is distant about three miles from Sidmouth, six from the market town of Honiton, six from Axmouth Harbour, and 14 from Exeter.—For viewing, apply to the Bailiff, at the farm, where the conditions of letting may be inspected; and any further information can be obtained of Messrs. DREW & SON, Land Agents, Peamore, near Exeter, to whom Tenders, with references, are to be sent on or before August 15.—Peamore, near Exeter, July 15.

WHITE COCHIN CHINA CHICKENS, of Mrs. HEBBERT'S breed.—Four pair, at 1*l.* per pair. For particulars apply to Rev. H. G. HARVEY, Droitwich, Worcester.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, July 18, at 12 o'clock precisely, A SELECTION OF POULTRY, from the yards of Mr. Bidwell, of Guildford; Mr. P. Jones, jun., Fulham; F. Sutton, Esq., Bury St. Edmonds; T. Shackell, Esq., Uxbridge; Mr. Plummer, Burlington; and others. It includes Cochins of all colours, prize spangled Hamburghs, Polands, Spanish, and Brahmas.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

ORCHIDS.
ESTABLISHED AND IMPORTED PLANTS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on MONDAY, 24th July, and following day, at 12 for 1 o'clock precisely, a collection of very rare and well grown established Plants, including many choice specimens of Aerides, Vanda, Saccolabium, Cattleyas, Phalænopsis, &c.; also importations from La Guyara and Guatemala, and three Cases from the East Indies, containing Amherstia nobilis, Tropical Fruits, &c.—May be viewed on the mornings of Sale, and Catalogues had.

VALUABLE FREEHOLD NURSERY GROUNDS, ETC.
FULFORD ROAD, YORK.

TO BE SOLD BY AUCTION, in the month of August next, the long-established and flourishing NURSERY PREMISES of the late Mr. GEORGE CLARKSON, situate on the banks of the Ouse, York, comprising about Fourteen acres of first-rate Nursery Ground well stocked with Forest and Fruit Trees, Shrubs, &c., and having a substantial Dwelling House, Shops, Greenhouse, and other requisite outbuildings attached, with two pleasant suburban Dwelling Houses fronting Fulford Road, commanding respectable tenants; together or in lots, unless previously disposed of by private contract, of which due notice will be given. The purchaser will have the option of taking the Stock on liberal terms. Immediate possession can be given.—Plans and particulars may be had on application to Joshua Hadwen, Esq., 12, Clement Street, Lombard Street, or Charles Lever, Esq., 1, Frederick's Place, Old Jewry, London; Robert Vint, Esq., High Street, Sunderland; Mr. J. S. Hardy, Architect, Lincoln; Messrs. Newsam and Son, Land Agents and Surveyors, Leeds; and of Mr. Luke Thompson, Solicitor, York.

RICK CLOTHS, MARQUEES, TENTS, ETC.

NEW OR SECOND-HAND, FOR SALE OR HIRE.

BENJAMIN EDGINGTON has for the ensuing season a large assortment of Marquees, &c., for Horticultural Societies, Fetes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A variety of Emigration Tents erected on the premises, No. 2, Duke Street, Southwark. Netting and Bunting for fruit trees. A warehouse, 32, Charing Cross, where tents are erected.—Address, by post, 2, Duke Street, Southwark.

RIPE FRUIT, STRAWBERRIES, AND SEED BEDS.

NEW TWINE NETTING, Tanned if required, 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard. Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard. The Elastic Hexagon Garden Netting, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower or seed beds, 4½*d.* per square yard. Tanned Netting, 2 or 3 yards wide, ½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard.—At W. CULLINGFORD'S, 1, Edmund Terrace, Ball's-pond Road, Islington, London; and at the Crystal Palace, Sydenham.

NEW AND BEAUTIFUL PLANTS.

MESSRS. VEITCH & SON,

OF EXETER, AND THE EXOTIC NURSERY, CHELSEA,

HAVE much pleasure and confidence in offering the following novelties. Never, perhaps, have they had the opportunity of presenting at one time so many really VALUABLE and STERLING PLANTS as they do on this occasion, believing them all to be Plants that will give general satisfaction, and tend to increase that confidence and support which have so long and so liberally been bestowed upon them.

The Plants are well established; and all Orders will be executed in the rotation in which they are received.

WELLINGTONIA GIGANTEA.

Ample description of this noble tree having lately appeared in the *Gardeners' Chronicle*, the *Times*, the *Illustrated London News*, Curtis's *Botanical Magazine*, the *Florist*, and other publications, it is only necessary now to say that it is a perfectly hardy Coniferous tree, of immense dimensions and great beauty.

Fine established seedling plants are now ready to send out on the following terms:—

One plant 2 guineas	Eight plants, 10 guineas
Four do., 6 „	Twelve do., 12 „

DESFONTAINIA SPINOSA.

A fine hardy evergreen flowering shrub, with glossy Holly-like foliage, introduced from the Andes of Patagonia by Mr. W. Lobb, *who discovered it in the region of snow.*

It produces beautiful tubular-shaped blossoms, often 2 inches in length, and of a rich scarlet colour tipped with yellow. (See figure in Curtis's Bot. Magazine for May, 1854.)

This plant having been fully exposed in the open ground during the three last winters may, consequently, be declared to *be perfectly hardy.*

It will certainly be a great acquisition.

Fine established plants, in three sizes, 21*s.*, 42*s.*, and 63*s.* each.

One over on three to the trade.

CERATOSTEMA LONGIFLORUM.

(Figured in Curtis's Botanical Magazine for April, 1854.)

A beautiful dwarf evergreen Greenhouse Shrub, introduced through Mr. W. Lobb, from the Andes of Peru.

It bears bunches of large tubular-shaped flowers, of a rich orange-scarlet colour, of a stout, waxy texture, and which are of great duration.

It was exhibited at Chiswick in July 1853, and obtained the first prize for new and rare plants.

Good established plants, of two sizes, 21*s.* and 31*s.* 6*d.* each.

One over on three to the trade.

LOMATIA FERRUGINEA.

This fine Evergreen Shrub was found in Chiloe and Patagonia by Mr. W. Lobb.

It attains a height of from 6 to 8 feet, and is remarkable for its beautiful Fern-like foliage.

As a fine leaved Conservatory Plant it is perhaps without a rival, and no collection of fine foliaged plants should be without it.

It has but to be seen to be admired.

Fine established plants of two sizes, 31*s.* 6*d.* and 42*s.* each.

One over on three to the trade.

UGENIA, OR MYRTUS UGNI.

(Figured in Curtis's "Botanical Magazine" for Jan., 1852.)

This very interesting evergreen flowering shrub was obtained from Patagonia through Mr. W. Lobb.

It has stood several winters in the open ground without shelter, producing its delightfully fragrant flowers in July, succeeded by Strawberry-flavoured berries, eaten in Chili as dessert.

It is a plant of easy culture, and, blooming freely in a small state, is well adapted for growing in pots.

Strong blooming plants, in 48-sized pots, 21*s.* each.
Second-sized „ in 60-sized pots, 15*s.* each.

One over on three to the trade.

FUCHSIA DOMINIANA.

The merit of raising this beautiful plant is due to Mr. Dominy, the Foreman of the Plant Department at the Exeter Nursery; it consequently bears his name as a memento of his zeal and ability in the performance of his duties. It is a seedling between Serratifolia multiflora and Spectabilis, having the fine free growth of the former and the splendid flowers of the latter.

It was exhibited at the National Floricultural Society's Meeting, October 6, 1853, and had a Certificate of Merit awarded it. It was also exhibited at the London Horticultural Society's Meeting, on the 18th of the same month, and was again similarly rewarded.—Price 10*s.* 6*d.* each, with one over when three are taken.

IMPATIENS JERDONIÆ.

This beautiful new Balsam is figured in "The Florist" of January last, and is certainly one of the most interesting of recent introductions.

It is of a dwarf neat habit, of easy cultivation, requiring the temperature of a warm greenhouse or stove, and an abundant bloomer, continuing in flower at least three months.

The flowers are in colour bright red and yellow. It was exhibited in the Hort. Soc. Rooms, 21, Regent Street, on the 18th October last, and had the highest prize for new plants awarded.

This is a lovely little plant.

Fine Established Plants ... ... 10*s.* 6*d.* each.
A few extra-sized do. ... ... 21*s.* „

One over on three to the trade.

HEXACENTRIS LUTEA.

A fine Stove Climber, introduced from the Neilgherry Hills, of easy culture and great beauty.

It produces its flowers in abundance, on elegant pendulous racemes, of from 15 to 18 inches in length, of a clear bright yellow, unmixed with any other colour.

The effect produced when seen drooping from the roof of the conservatory or a trellis is most striking.

It was exhibited at Chiswick on the 13th May last, and obtained the Silver Banksian Medal.

Strong Established Plants ... ... 21*s.* 0*d.* each.
Second sized „ ... ... 10*s.* 6*d.* „

One over on three to the trade.

VERONICA VARIEGATA.

This lovely hybrid Veronica was raised by J. Anderson, Esq., of Maryfield, Edinburgh, between V. Andersoni and V. salicifolia.

In character it is intermediate between the two parents, having a bushy compact habit, and small glossy foliage.

It is an abundant bloomer.

The racemes of flowers on first appearing are a clear bright pink, and gradually shade off to a pure white, producing a very pretty and striking effect.

It is really a most useful and attractive plant.

It was exhibited at Chiswick in July, 1853, and was awarded a Medal and greatly admired.

Fine bushy plants, 10*s.* 6*d.* each. Three for 21*s.*, to the Trade.

AZALEA INDICA.

Striata formosissima (Taylor).

This beautiful new Azalea is now offered for the first time. It is a seedling raised by Mr. Taylor, gardener to J. Coster, Esq., of Streatham. It is a pure white, flaked and spotted with light purple, fine form, good substance, and first-rate habit.

It was exhibited at the National Floricultural Society, on the 16th June, 1853, and received a Certificate of Merit.

It was also exhibited at the June exhibitions of the Royal Botanic Society, Regent's Park, and the Horticultural Society, at Chiswick, on both which occasions it received prizes.

Worked plants are now ready at 21*s.* each. One over on three to the Trade.

Messrs. VEITCH & SON can also supply the following good and popular Plants:—

Abies bracteata (seedling)... ...	... 63*s.* each.
Aphelandra Leopoldi	... 21*s.* „
Azalea indica, Beauté de l'Europe	... 3*s.* 6*d.* to 21*s.* each.
Begonia Thwaitesi	... 10*s.* 6*d.* „
Camellia, Countess of Orkney ...	... 21*s.* „
„ Storyii	... 10*s.* 6*d.* „
Hoya fraterna	... 10*s.* 6*d.* to 21*s.* „
Ixora Lobbi	... 10*s.* 6*d.* to 21*s.* „
Lilium giganteum	... 21*s.*, 42*s.*, 63*s.* „
Philesia buxifolia	... 21*s.* „
Rhododendron jasminiflorum ...	... 21*s.* to 63*s.* „
Rhodoleia Championi	... 7*s.* 6*d.* to 21*s.* „
Streptocarpus biflorus	... 3*s.* 6*d.* „

Detailed Lists are now preparing, and will be forwarded on application.

NURSERIES, EXETER AND CHELSEA.—July 15, 1854.

This day is published, THIRD EDITION, *at* 3*s.* 6*d.*

TALPA;

ISLEWORTH HORTICULTURAL FETE. — SCHOOL TREAT AND JUVENILE REGATTA, under distinguished patronage, will take place on AUGUST 11th, instead of the 8th, as previously advertised (on account of the Thames National Regatta being fixed for the 8th), in the GROUNDS of GORDON HOUSE, by kind permission of Hamilton Cooke, Esq., and Saint Margarets, by kind permission of the Committee of the Conservative Land Society, on the banks of the Thames, when prizes open to all England will be awarded for FLOWERS, FRUITS, and VEGETABLES.—Further particulars may be obtained on application to HICKSON BRIGGS, Hon. Sec.
Holland House, Isleworth, July 22.

DARLINGTON HORTICULTURAL SOCIETY. —The SUMMER EXHIBITION will be held on FRIDAY, August 4th, at Southend, the seat of Joseph Pease, Esq., when Prizes will be awarded for Flowers, Fruits, and Vegetables. Successful Exhibitors of Pot Plants, if residing more than 10 and less than 25 miles from Darlington, will have 10 per cent. added to their prizes; if above 25 miles, 25 per cent. will be added. Schedules to be had of the Honorary Secretaries—
JOHN BOUSFIELD, WILLIAM ROBINSON, EDWARD PEASE, jun.

CHEPSTOW HORTICULTURAL SOCIETY. — The second and last Show for this season will take place on THURSDAY, September 7, 1854, when the undermentioned prizes will be given:—For the best collection of 12 Stove and Greenhouse Plants (given by the inhabitants of Chepstow, open to all England), first prize, a Silver Cup, value 10*l.* 10*s.*; second ditto ditto, 5*l.* 5*s.* N.B. The second prize given by the Society.—Calceolarias, Fuchsias, Orchids, and Pelargoniums, will be excluded from the above collection. For the best Stand of 24 Bunches of Roses, of different names, not more than 3 stems in a bunch, with their own foliage and buds (given by the Wye Steam Packet Company) open to all England. First prize, a Silver Cup, value 5*l.* 5*s.*; second ditto, a Piece of Plate, 2*l.* 2*s.*; N.B. The 2d prize given by the Society. For the best Stand of 36 Dahlias (given by the Society) open to all England. First prize, a Silver Cup, value 5*l.* 5*s.*; second ditto, a Piece of Plate, 2*l.* 2*s.* By the kind permission of Colonel the Hon. Arthur Upton, the band of the Coldstream Guards will perform during the fête. Exhibitors are requested to make an early application for schedules, which may be obtained of the Secretary, Mr JOHN F. HARTLAND, Welsh Street, Chepstow.

THE ANNUAL FETE OF THE BUCKINGHAM HORTICULTURAL AND FLORAL SOCIETY will be held on WEDNESDAY, the 26th of July, 1854, in the spacious Garden of the late Cobham Arms Hotel and the adjoining Grounds, by the kind permission of the Proprietors, where extensive arrangements will be made for the accommodation of Exhibitors.
Twenty-one Prizes, including Two Silver Cups, open to ALL England, together with upwards of 60 Prizes to Nurserymen, Gentlemen's Gardeners, and Amateurs, and 50 Cottagers' Prizes, will be offered for competition. Schedules and full particulars may be obtained on application to Messrs. MARTIN and THORPE, Hon. Secretaries and Treasurers.

PARIS UNIVERSAL EXHIBITION OF 1855.
NOTICE IS HEREBY GIVEN, that all demands for Space should be sent in by intending Exhibitors immediately, or at latest on the 1st August.
(By order) H. C. OWEN, Captain R.E.
Marlborough House, Pall Mall, London, July 22.

ROSES.
G. CLARKE respectfully invites the attention of lovers of Roses to his unrivalled Collection, extending over 10 acres of ground, which may now be seen in full bloom. Plants can be selected now and orders executed in the autumn.
Streatham Place Nursery, Brixton Hill, near London; four miles from London. The nearest and most pleasant route from the West End to the Crystal Palace.

CALCEOLARIA AND CINERARIA SEEDS.
GEORGE CLARKE begs to intimate that he has now ready for sale choice Seed of Calceolaria and Cineraria. The collection of Calceolarias from which the Seed now offered was saved forms an unrivalled one, and has been the admiration of all who have seen it; they possess every variety of colour peculiar to the genus, fine shapes, and have been awarded several first-class Certificates. Great care has also been taken in selecting the Cineraria from none but first-rate flowers; and, like the Calceolaria, it is warranted to give satisfaction.—Packets of both, 2*s.* 6*d.* each, will be sent on receipt of postage stamps to the amount.—Streatham Place Nursery, Brixton Hill, near London.

THE QUEEN OR CAULIFLOWER CABBAGE.—The above Cabbage is of most delicate flavour, quite equal to the Cauliflower; very early, and requires good ground. The stumps left in the spring after the Cabbages are cut will reproduce Cabbages all the summer, so that persons growing this kind need not make more than one good bed in the year. It should be sown this month, and planted out in September.—1*s.* per oz.
LONDON MARKET CABBAGE.—Saved from a very choice stock. This kind is of larger growth than the Queen, and will do well for exposed situations.—1*s.* per oz.
The above sent free by post on the receipt of postage stamps or a post-office order.
JOSEPH SHILLING, Nurseryman and Seedsman, Winchester.

FOR PRESENT SOWING.
SUTTON'S IMPERIAL CABBAGE, *the earliest sort for spring cutting; large, and fine flavour.* Price 1*s.* per ounce, or 6*d.* per packet, post free. Payment may be made by postage or receipt stamps.
Address—SUTTON AND SONS, Reading, Berks.

MAY'S PARAGON CABBAGE.—Prepaid postage. The above superb CABBAGE can still be had in 1 oz. packets, 1*s.* each. Sow July and August.
Also new CINERARIA SEED from the best named flowers, in packets, 2*s.* 6*d.* each.
Address, HENRY MAY, the Hope Nurseries, near Bedale, Yorks.

HARDY'S NEW EARLY DWARF CRYSTAL CABBAGE.
ABRAHAM HARDY AND SON, SEED GROWERS, Maldon, Essex, can with confidence recommend this as a superior kind, and warrants it to give entire satisfaction. One ounce will be sent to any address, post free, on receipt of 1*s.*, or postage stamps equivalent. Sow in July or August.

THE LARGE YELLOW STONE TURNIP.
JOHN RIVERS has about 20 bushels of this large and valuable Hybrid Turnip, well adapted for sowing in August and for winter feed. J. R. is open to an offer from the trade for all or part of the above quantity.—Address JOHN RIVERS, Sawbridgeworth.

FUCHSIA "DUKE OF WELLINGTON."
MOORE AND SON can supply good Plants in Bloom of this unrivalled Fuchsia, at 5*s.* each.
Perry Barr Nursery, near Birmingham.

PICOTEES AND CARNATIONS.
CHARLES TURNER'S very fine and extensive Collections of these Flowers, including some fine new varieties, are now in FULL BLOOM, and may be seen daily.
Royal Nursery, Slough.—July 22.

NEW PLANT CATALOGUE.

Gilling, Richmond, Yorkshire.

ROBERT SIM'S NEW CATALOGUE of more than 250 species and varieties of STOVE, GREENHOUSE, and HARDY EXOTIC and BRITISH FERNS, &c., can be had for one stamp.—Nursery, Foot's Cray, Kent.

NEW [illegible] PLANT.
CALCEOLARIA AJAX
LUCOMBE, PINCE, AND CO., are now sending out healthy Plants of their much admired
NEW SHRUBBY CALCEOLARIA.
It is now flowering profusely in their Nursery, and they respectfully call attention to it. See *Gardeners' Chronicle*, May 6th.
42*s.* per dozen; a few strong plants at 7*s.* 6*d.* each.
Exeter Nursery, Exeter.

CHOICE CINERARIA
AND
CALCEOLARIA SEEDS.
LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior
CINERARIAS AND CALCEOLARIAS,
which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.
Packets of each, sealed and warranted by them, at 2*s.* 6*d.*, free by post.—Exeter Nursery, Exeter, July 22.

SEEDS OF CALCEOLARIA AND CINERARIA.
E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, the new Seed saved this season from their unrivalled collection, in packets at 2*s.* 6*d.* and 5*s.* each.

The CALCEOLARIA, first quality	... ...	5*s.* 0*d.*
" second "	... ...	2 6

QUALITY, and not QUANTITY, forwarded at the above prices.

FERNS AND LYCOPODIUMS.
E. COOLING begs to offer the following, in good Plants:—

12 choice Ferns and Lycopodiums, suitable for a Wardian case, Gold Fern included	... 15*s.* and 20*s.*
12 choice Indian Azaleas, to name ...	... 12*s.* and 18*s.*
6 finest new Verbenas	... 6*s.* and 9*s.*

The Nurseries, Derby.—July 22.

SPLENDID
CALCEOLARIA, CINERARIA, & SWEET WILLIAM SEED.
WILLIAM BARNES respectfully begs to inform his friends and the public generally, that he has now ready to send out in packets, at 2*s.* 6*d.* each, seed of his unrivalled Herbaceous Calceolarias, which has given so much satisfaction for two years; the varieties have been selected with the greatest care, and none but the finest colours and best shaped flowers have been retained and carefully hybridised.
W. B. has for two years paid great attention to the improvement of the SHRUBBY BEDDING CALCEOLARIA, having purchased all the best kinds from the most eminent growers, and selected from them while in bloom the best shapes, finest colours, and most perfect shrubs; by careful hybridising he has succeeded in raising some first-rate varieties, and is now enabled to offer a few packets of fine new seed at 5*s.* per packet; this W. B. feels assured will give as much satisfaction as his herbaceous varieties have done before, which numerous letters he has received from various parts of the United Kingdom will testify.
CINERARIA SEED, saved from none but the very best and newest varieties in cultivation, at 2*s.* 6*d.* per packet.
The SWEET WILLIAMS have been grown in his Nursery Grounds for two successive years, and have caused universal admiration from all those who have seen them in bloom; nothing can be more beautiful for either clumps or borders, and they retain their great beauty for a very long time. Packets of fine seed at 1*s.* 6*d.* each. A remittance is expected from unknown correspondents.—Camden Nursery, Camberwell, London.

STRAWBERRIES.
WILLIAM NICHOLSON is now sending out strong, [illegible] rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, very fine dessert fruit, very beautiful, solid, and juicy. RUBY, a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.
Eggliescliffe, near Yarm, July 22.

GRAPE VINES FROM EYES, IN POTS.—The undersigned has now to dispose of a large stock of GRAPE VINES raised from eyes this season, strong, and in vigorous health, now exposed to greenhouse temperature, and hardened so that they can be sent safely to any part of the kingdom without check or injury. By planting now, a whole season will be saved. They comprise all the leading kinds, and an inspection of them is respectfully solicited.
R. GLENDINNING, Chiswick Nursery, near London.

THE BEST PLANT OF THE SEASON.
"BEGONIA PRESTONIENSIS SUPERBA."
W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr. Frost, Gardener to E. L. Betts, Esq., Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with anthers, resembling a double blossom with a golden tinge, exhibiting a charming contrast; the flowers are delightfully fragrant as a Tea-scented Rose—latest dwarf and bushy; the flowers are thrown well above the foliage, in large trusses; and altogether one of the best plants yet offered. It received the highest award in June at the Royal Botanic Show, Regent's Park, as a new plant; also at Maidstone and Ashford. Plants in October, 10*s.* 6*d.* each; one given where three or more are taken.—Bower Nurseries, High Street, Maidstone.

TO BE SOLD, the whole stock of the INCOMPARABLE PEA, which possesses the following properties, viz., being the most early and abundant cropper, and the produce superior for table. Any lady, gentleman, or seedsman may now inspect it in its growing state, at Rosslyn House Garden, Hampstead; the Gardener, Mr. NICOLS, will be proud to show it, as it is now in its beauty. As a practical gardener Mr. NICOLS has long made it his study to produce something superior, and he now gives a challenge to all England to produce its equal.

HAY.
TO BE SOLD, from 50 to 60 Tons of very Prime MEADOW HAY, well made in 1852.—Apply to Mr. JEREMIAH SINGER, Clink, Frome, Somerset. There is a Station of the Great Western Railway about a mile from the Farm.

SOUTHDOWN RAMS.
MR. R. H. ELLMAN informs his Friends that his RAMS are now ready for Letting or Sale. The Rams may be seen and terms known at any time.—Landport, Lewes.

SOUTHDOWN RAMS.
MR. W. SAINSBURY informs the Breeders of Southdown Sheep that his RAMS will be ready for Letting any time after the 22d day of July.
Manor House, West Lavington, Devizes.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. Directions for application forwarded. Ten gallons and upwards carriage free to London.
For testimonials, see whole page of *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth.
From Andrew Toward, Esq., Royal Gardens, Osborne Palace.
"I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose Trees much affected with the Green Fly."
From Frederick Malleson, Esq., Royal Gardens, Claremont.
"I find it answer the purpose in all respects for Walls, also the Green Fly and Brown Scale in the Houses.—May 9, 1854."
Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & CO.'s, Seed Merchants Oxford Street, Southampton (90 yards from the Railway and Docks).

RICK CLOTHS, MARQUEES, TENTS, ETC.
NEW OR SECOND-HAND, FOR SALE OR HIRE.
BENJAMIN EDGINGTON has for the ensuing season a large assortment of Marquees, &c., for Horticultural Societies, Fêtes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A variety of Emigration Tents erected on the premises, No. 2, Duke Street, Southwark. Netting and Bunting for fruit trees. A warehouse, 32, Charing Cross, where tents are erected.—Address, by post, 2, Duke Street, Southwark.

TO FLORISTS AND OTHERS.
J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

NEW FUCHSIAS OF 1854, sent out by Banks and others. The set of 17, well established plants, for 34*s.*, or any 12 for 28*s.*:—Stokes' Duke of Wellington, Smith's Telegraph, Kimberley's Henry Monteith and Globosa splendens; Banks' Autocrat, Charmer, Vanguard, Queen of Hanover, Elegans, Clio, and Magnifica; Cole's Trentham, Henderson's Monarch; Batten's Charles Palmer, Grandissima, and Admiral; Standish's Perfection.

NEW VERBENAS OF 1854, sent out by Banks, Keens, Smith, and others. A selection of any 30 from the following may be made for 40*s.*, or, per dozen, 18*s.*:—Keynes' Ajax, Arethusa, Captivation, Emily, Lord Mayor, and Magnet; Barnes' Lutea pallida, and Madonna; Smith's Peter Dick, Noblissima, Climax, Eblouisante, Angelina, Queen, Alice, Scarlet King, Forget-me-Not, Zaria, Caliban, Giralda, Islington Rival, Magnificent, Laura superba, and Triumph; Robinson's Mrs. D. Tyssen; Edmunds' Rouge et Noir, and President; Banks' Orion, Robin Hood, Marie Antoinette, Marchless, Beauty, Madonna, Attraction, Diadem, Ne Plus Ultra, and Arioste; Fozart's Beauty of the Garden; Stewart's Sulphur Model, and Ida; Igley's Honeysuckle; Bragg's Standard, Fair Rosamond, Incomparable, Lord Seaton, King of Purples, Queen of Roses, Prince of Wales, Venus, and Queen of Purples: Meiu's Leucostemma, Mitchell's Elegantissima.

NEW PETUNIAS OF 1854, the nine varieties for 14*s.*:—Kimberley's Novelty, Van Houtte's Striata formosissima; Barnes' Elizabeth, Distinctus, Pencillata, Rotunda, Alba magniflora, and Formosa; Smith's Montreal Purple.

---

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

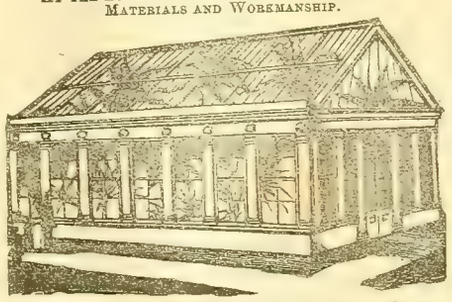
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND DRMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

(Fig. 1.)

(Fig. 2.)

No. 10 holds 8 gallons, throws	25	feet	high	...	£2	15
No. 13 „ 12 „	30	„		...	3	5
No. 11 „ 16 „	40	„		...	4	0
No. 12 „ 24 „	45	„		...	5	0
No. 14 „ 30 „	45	„		...	5	18

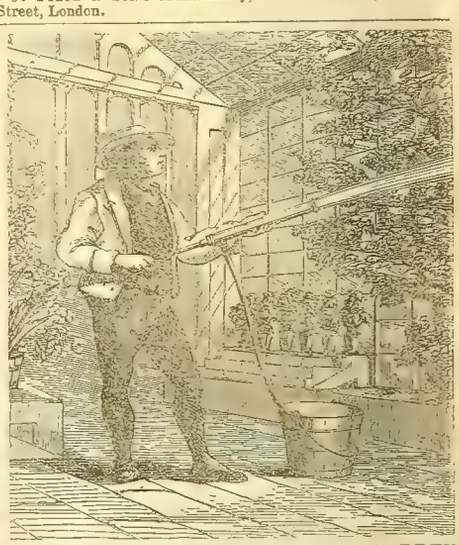
A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

ENCAUSTIC TILE PAVEMENTS.

MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

SPLENDID NEW RHUBARB.

SALT'S CRIMSON PERFECTION.

ROBERT SALT, GARDENER, Longton, Staffordshire, will send out roots of this early, productive, and delicious variety of Rhubarb this autumn; see *Gardeners' Chronicle*, June 11, 1853: "Very good, and most beautiful crimson; compared with others, it is remarkable for the small amount of acidity it contains."

A Certificate of Merit was awarded for specimens exhibited at the meeting of the London Horticultural Society, June 28, 1853; likewise a first-class Certificate at Nottingham Horticultural Society, May 24, 1854; and at the Midland do., May 25, 1854.

Single roots, 7*s.* 6*d.*, three for one guinea, and six for 2*l.* Orders forwarded now to ROBERT SALT, or to HURST & M'MULLEN, 6, Leadenhall Street, London; Mr. Wood, Nurseryman, Coppice, near Nottingham; Messrs. Burgess & Kent, Nurserymen, Penkhull; Messrs. F. and A. Dickson & Sons, Seed Merchants and Nurserymen, 106, Eastgate Street, Chester, will have the earliest attention. A Post-office order requested from unknown correspondents.—Longton, July 22.

WARD'S "OMER PACHA" STRAWBERRY.

W. J. WARD (by permission of his employer, W. Stephens, Esq.,) offers to his friends and the public the above Seedling Strawberry, which has been proved to possess superior excellence. It is a large handsome fruit, intermediate between the old Carolina Pine and British Queen, partaking of the fine colour of the former, and by many considered superior in flavour to the latter; it is also remarkable for the fine buttery quality of its flesh. Great bearer; ripe as early as Keens' Seedling, affording a long succession of fine fruit. It was exhibited at the Royal Botanic Gardens, Regent's Park, on Wednesday, July 5th, and obtained the Bronze Medal. It has also been submitted to Mr. Thompson, Horticultural Society, Chiswick; and Mr. Spencer, Bowood, both of whom speak highly favourably of it. Also the following, who have pronounced it first-rate, and are open to take orders for it:—Messrs. Henderson, Pine-apple Place, London; Mr. C. Turner, Royal Nursery, Slough; Messrs. Standish and Noble, Bagshot; Mr. P. Lydiard, Fruiterer, Bath-easton, Bath; Mr. W. J. Epps, Bower Nursery, Maidstone; Messrs. Sutton, Reading; Mr. W. Barnes, Camberwell; Mr. Lewis Solomon, Fruiterer, Covent Garden.

Strong well rooted plants last week in August. Terms, cash or reference.—100 plants, 3*l.*; 50 plants, 1*l.* 15*s.*; 25 ditto, 1*l.* A few strong plants in 32-sized pots, 15*s.* per dozen.

Prospect Hill, Reading, July 22.

THE NEW RHODODENDRONS OF ASSAM AND BOOTAN.

EXHIBITED AT CHISWICK ON SATURDAY, JULY 8TH, BY MR. J. VEITCH, JUN., OF CHELSEA.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to say that in consequence of some remarks having been made to them respecting the above, and other reports having been circulated, originating, as they have been given to understand, from the Exotic Nursery, Chelsea, and which they are sure can have no foundation, think it right to put the readers of this Journal in full possession of the facts—which are, that in the month of March of the present year, Mr. Veitch was in communication with Mr. Nuttal respecting the above Rhododendrons, and in a letter dated the 16th March, Mr. V. requested to have a single plant of the following varieties for inspection, which were accordingly forwarded to him, viz., Keysi, Nuttali, Kendricki, eximium, longifolium, lucidum, calophyllum, and Camelliæflorum; and no other plants have subsequently passed into his hands from Mr. Nuttal.

Messrs. E. G. H. & Son were quite aware of this circumstance at the time of purchasing, and that a few other plants had previously left the collection of Mr. Nuttal.

Wellington Nursery, St. John's Wood, July 22.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY.

JAMES VEITCH, JUN., has the pleasure to inform the public that Mr. Patterson, Gardener to Baroness Wenman, of Thame Park, Oxon, has placed in his hands for distribution the stock of the above first-rate Seedling Strawberry, which, having been fully tested and exhibited, has proved to be of very superior excellence.

It was exhibited at Chiswick, on Saturday, June 3 and received the Silver Knightian Medal; it has also been submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom report most favourably of its merits.

It is a *first-class forcing* Strawberry in character, intermediate between *its parents—Keens' Seedling* and *British Queen*, of the vigorous habit of the *former*, and fully one week earlier in ripening; and in the quality of its fruit *fully equal* in flavour, if not superior, to the latter. The fruit is of a large size and handsome shape, of a *bright red colour*, and with a remarkably high perfume.

Orders are now taking for strong plants to be sent out the first week in September on the following terms:—

100 Plants ... £3 | 50 Plants ... £2 | 12 Plants ... 12*s.*

Exotic Nursery, Chelsea.—July 22.

GEORGE DAVIES begs to offer to the trade the following NEW PLANTS, strong and healthy:—

Wistaria sinensis alba	... 42*s.* per doz.
Prunus sinensis flore pleno ...	... 7*s.* 6*d.* each.
Pernettya ciliaris	... 30*s.* per doz.
Rhodoleia Championi	... 60*s.* „
Echites Harrisoni	... 7*s.* 6*d.* each.
Cytisus onosperma	... 3*s.* 6*d.* „
„ filipes	... 2*s.* 6*d.* „
„ racemosus superba ...	... 18*s.* per doz.
Daphne indica rubra	... 12*s.* „
Boronia Drummondi	... 3*s.* 6*d.* each, 36*s.* doz.
Azalea Stanleyana	... 7*s.* 6*d.* each, 60*s.* „
Gloxinia Wilsoni	... 3*s.* 6*d.* „

G. D. can with confidence recommend Azalea Stanleyana as one of the best out; the habit is compact and bushy, flower bright rose, with dark spots in the upper petal, very large, fine form and great substance, a most profuse bloomer, and has given universal satisfaction.

Stanley and Green Lane Nurseries, Old Swan, Liverpool.

NEW ROSES IN POTS.

W. J. EPPS, of Maidstone and Ashford, can now supply fine strong Plants of the following new ROSES. The Plants average from 10 to 20 buds, fit for immediate working.

HYBRID PERPETUALS.		HYBRID PERPETUALS.	
Adam Paul	3*s.* 6*d.*	Colonel Rougemont ...	5*s.* 0*d.*
Louis Peyrouny ...	3 6	Gloire de France ...	7 6
Baronne Heckerean ...	5 0	Joseph Descarme ...	3 6

Baronne le Kermont ...	5 0	„ David Pradel ...	2 6
Lady Stewart	5 0	„ Gloire de Dijon ..	7 6
Jules Margottin ...	7 6	„ Georges de France	5 0

W. J. E. can offer choice varieties, such as Queen Victoria, Egarie, Triomphe de Valenciennes, Standard de Marengo, L'Ergant Vere, Madame Campbell, Palais de Cristal, &c., at 30*s.* per dozen, or 2*s.* 6*d.* each.

LASTREA FILIX MAS VAR. CRISTATA, ATHYRIUM FILIX FŒMINA VAR. MULTIFIDUM.

ROBERT SIM begs to draw the attention of Growers of HARDY FERNS to these extremely beautiful and unequalled British varieties.

LASTREA FILIX MAS VAR. CRISTATA.—Fronds 2 feet long, pinnæ broadly multifid at their points, giving the whole plant an unique and very elegant appearance. Very rare. Fine young plants, 5*s.*, and larger 7*s.* 6*d.* each. Small do. by post, 3*s.* 6*d.* each.

ATHYRIUM FILIX FŒMINA VAR. MULTIFIDUM.—Fronds 2 feet long, pendant, the ends of the pinnæ so much multifid as to appear tasselled. Fine young plants, 5*s.* each.

They form elegant Conservatory Ferns also.

Carriage free to London. Post-office orders on Chiselhurst. Nursery, Foot's Cray, Kent.

ŒNOTHERA MACROCARPA, AND NEW VERBENAS.

JAMES SYRED, FLORIST, Redhill, Reigate, Surrey, can supply good healthy Plants of the under-mentioned new VERBENAS, at 1*s.* each or 10*s.* per dozen:—Delicata, Unique, Mrs. D. Tyssen, Annie Laurie, Sir C. Napier, Rouge et Noir, Prince of Orange, President, Mrs. Gerard Leigh, Canary Bird, Vicomte de Balleval, Peter Dick, Pandora, Amazon, Arsine, Beaugard, Young England, National, Superb, Nina, Iris, Annette, Madame de Frileuse, Comet, Giraldia, Ajax, Alice, Mrs. F. G. Caley, Densa, Hector, Heroine, Eblouissante, Hebe, Augustine, Francoise Rousseau, Rougeri, Madame Schmidt, Arthur, Caliban, Climax, Angelina, Islington Rival, Electra, Nobilissima, Triumph, Forget-Me-Not, Queen, Scarlet King, Magnificent, and Zaria. Strong Plants of Œnothera macrocarpa, at 7*s.* 6*d.* per dozen, or 50*s.* per 100.—Post-office orders payable at Reigate.

CHOICE SEEDS FOR PRESENT SOWING.—Free by post at the prices annexed:

CABBAGE, Cattell's Dwarf Barnes, 1*s.* per oz. packet,
„ „ Reliance, 1*s.* per half-oz. do.

ANEMONE, Single Poppy, very fine, mixed, 6*d.* per packet, or 3*s.* per oz.
„ „ „ saved from all scarlet flowers, 6*d.* p. pkt.
CALCEOLARIA, from fine sorts carefully hybridised (with directions for sowing, &c.), 2*s.* 6*d.* per packet.
CINERARIA, from finest varieties, 2*s.* 6*d.* per packet.
GERANIUM, from newest florist varieties, 12 seeds, 2*s.* 6*d.* p. pkt.
„ from fine older do. do. 12 seeds, 1*s.* per packet.
MIMULUS, mixed from very finest varieties, 6*d.* per packet.
PRIMULA SINENSIS, fine fringed pink varieties, 1*s.* p. packet.
„ „ „ „ white do., 1*s.* per packet.

A remittance or reference to accompany all orders from unknown correspondents.

Address, JOHN CATTELL, Westerham, Kent.

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Magazine of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched as soon as the young growth of this season is sufficiently ripened for travelling. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, July 15.

CHIVAS'S ORANGE JELLY TURNIP SEED.

NEW SEED NOW READY (CARRIAGE FREE).

MESSRS. SUTTON AND SONS, SEED-GROWERS, Reading, having grown a large crop of fine true Seed from Stock received of Mr. Chivas, last season, can supply the same on liberal terms, according to quantity required. SUTTON & SONS can also supply (Carriage free) Seed direct from Mr. Chivas, at the same price as at Chester.

N.B.—The Orders first received will be first executed.

SUTTON'S LINCOLNSHIRE RED GLOBE TURNIP.

For Sowing previous to the second week in August. The largest and heaviest cropping Turnip yet introduced.

NEW SEED, just harvested, 1*s.* 4*d.* per lb., 8*s.* per gallon, 60*s.* per bushel.

PHILIP PUSEY, Esq., first presented Messrs. Sutton with Seed of this sort to grow a Stock from, and they have since had the honour of supplying him annually with seed for his own farms. In November last, Messrs. Sutton were favoured with the following letter from Mr. Albert Edmonds, Steward to Philip Pusey, Esq.:—"By the desire of Mr. Pusey, I beg to inform you that he had a fine crop of the Red Lincolnshire Turnip, weighing 30 tons 10 cwt. 1 qr. 24 lbs. per acre."

"The Lincolnshire Red Turnip, the seed of which I had from you, has produced the heaviest crop I ever grew."—*From Mr. T Chandler, Manufacturer of Liquid Manure Drills, Aldbourne, Hungerford, November* 11, 1853.

We have also received very many letters of a similar nature from other customers, some of whom have had upwards of 40 tons per acre.

SUTTON'S EARLY SIX WEEKS' TURNIP.

THE QUICKEST TURNIP KNOWN.

Time of Sowing, middle of July to middle of September.—NEW SEED, 1*s.* 3*d.* per lb., 7*s.* per gallon, or 50*s.* per bushel.

This is a hardy sort, and will grow freely in all soils; it is called "Six Weeks," from the fact of its attaining to a large size within six weeks from the time of sowing, if the weather is warm; in cold climates it requires a little more time, but is a hardy and certain cropper.

SUTTON & SONS, having for many years adhered to the practice of selling none but genuine, new, unadulterated Seeds, have the satisfaction of receiving strong commendations from all parts of the Kingdom. From many similar letters the following is selected:—

"The Turnip Seeds I had from you last season answered beyond my expectation, and exceeded by far any that I procured elsewhere. I should have been many pounds in pocket if I had procured all I wanted from you."—*From John Hanson, Esq., Culgaith, Penrith, Cumberland, January* 10, 1854.

Goods delivered Carriage Free, except very small parcels.

ADDRESS—JOHN SUTTON & SONS, SEED-GROWERS, READING, BERKS.

The Gardeners' Chronicle.

SATURDAY, JULY 22, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, July 25—Horticultural ..... 3 P.M.

AMONG the valuable drawings of Chinese plants in the library of the Horticultural Society, is one of a dark rugged root, some 10 inches long, and 6 inches wide at the broadest end, of which nothing more is known than that it was obtained from the public vegetable market. There can, however, be no doubt that it represents a Yam of some kind.

According to M. STANISLAS JULIEN, as quoted lately by M. DECAISNE, a Yam, called Chou-Ya, or Tchou-Yu, Tou-Tchou, Chau-Tchou, Chau-Yo, &c., is universally grown in China. That of Nankin is the largest, and of excellent quality; another from the Chou country is still better. Its stems trail on the ground, the leaves are three-lobed; and in the autumn what are called fruits, but no doubt small tubers, appear among the leaves, and eventually drop off. This is perhaps the root represented in the place referred to. There are, however, many other sorts.

But the Chinese Yams have attracted no attention in Europe. It is probable that they have been considered too tender, our notions of a Yam being formed from East and West Indian reports. It seems, however, that one at least of the Chinese Yams is as hardy as a Potato, and likely to become a formidable competitor with the Potato itself.

M. DECAISNE tells us that the French experiments with a Yam introduced from Shanghae, and called erroneously Dioscorea japonica, justify the expectation that it will become a plant of real importance in cultivation. "If," says M. DECAISNE, "a new plant is to have a chance of becoming useful in rural economy, it must fulfil certain conditions, in the absence of which its cultivation cannot be profitable. In the first place, it must have been domesticated in some measure, and must suit the climate; moreover, it must, in a few months, go through all the stages of development, so as not to interfere with the ordinary and regular course of cropping; and finally, its produce must have a market value in one form or another. If the plant is intended for the food of man, it is also indispensable that it shall not offend the taste or the culinary habits of the persons among whom it is introduced. To this may be added that almost all the old perennial plants of the kitchen-garden have been abandoned in favour of annuals, wherever the latter could be found with similar properties; thus *Lathyrus tuberosus, Sedum Telephium,* and *Cirsium oleraceum* have given way before Potatoes, Spinage, and the like. Now, the Chinese Yam satisfies every one of these conditions. It has been domesticated from time immemorial; it is perfectly hardy in this climate (Paris); its root is bulky, rich in nutritive matter, eatable when raw, easily cooked either by boiling or roasting, and then having no other taste than that of flour (*fécule*). It is as much a ready-

made bread as the Potato, and it is better than the Batatas or Sweet Potato. Gardeners should therefore provide themselves with the new arrival, and try experiments with it in the different climates and soils of France. If they bring to their task, which is of great public importance, the requisite amount of perseverance and intelligence, I have a firm belief that the Potato Yam (Igname-Batatas) will, like its predecessor the Potato, make many a fortune, and more especially alleviate the distress of the lower classes of the people."

Testimony of this kind appears too important to be regarded lightly, and we are glad to second the recommendation of so judicious an experimentalist as M. DECAISNE. When we consider how nearly our common Black Bryony (*Tamus communis*) is related to the Yams, the probability of the new plant becoming naturalised among us receives further support. We would also suggest that all owners of ships trading with Shanghae, or other northern Chinese ports, should direct their captains to bring home a quantity of the Yams exposed for sale in the markets. We know that there are many varieties, possibly belonging to more species than one, and it is deserving of enquiry whether one may not suit the climate of Europe better than another.

The species described by M. DECAISNE is called by him *Dioscorea Batatas*, or Igname-Batate, and is described as having much the appearance of the common Tamus. Its stems are annual, but its roots, or more properly speaking rhizomes, are perennial, and directed downwards perpendicularly, sometimes to the depth of a yard, if the soil is loose enough to admit them. The haulm is about as thick as a goose quill, cylindrical, turning from right to left, and about 2 yards long, violet, with small whitish specks. When left to themselves the stems lie flat on the ground, and strike root very readily. The leaves are opposite, heart-shaped, and triangular, upon purple stalks. The "roots" vary in length and thickness with the soil in which they grow. They may usually be compared to clubs, the blunt end of which is as big as the fist, but which tapers downwards till it is no bigger than the finger. Their skin resembles in colour the well-known beverage coffee and milk, and is covered with numerous fibrous rootlets. Under the skin is a white, opaline, very friable, slightly milky cellular mass, filled with flour, which softens and dries in cooking, till it acquires the taste and quality of a Potato, for which it might be mistaken. Each plant may produce several of these roots, though in general there are only two or three.

M. DECAISNE and his friends who have tasted this Yam think that no serious objection will be taken to the employment of it as food. The only question is whether a root which buries itself so deep in the ground will suit the habits of cultivators. It is not, however, easy to understand why, in Europe, the trifling mechanical difficulty of getting up such roots should be a hindrance, when the Chinese with their rude tools find the operation easy enough. In that country the Yam is grown on a great scale. M. MONTIGNY, who sent it to France from Shanghae, calls it *Sain-In*, and says it is highly productive, the country people consuming it as largely as the Potato in Europe. For propagation the smallest roots are set apart and pitted, to keep them from frost. In the spring the roots are taken out and planted in furrows pretty near each other in well prepared ground. They soon sprout and form prostrate stems, which are made into cuttings as soon as they are 6 feet long. As soon as the cuttings are ready a field is worked into ridges, along each of which is formed a small furrow, in which the pieces of the stem are laid down and covered with a little earth, except the leaves. If the weather is rainy the cuttings strike immediately; if dry they must be watered till they do strike. In 15 or 20 days the roots begin to form, and at the same time lateral branches appear, which must be carefully removed from time to time, or the roots will not grow to the proper size.

These directions are simple and easy enough to follow; so that we see no reason why, as M. DECAISNE remarks, the plant should not be perfectly suited to field cultivation. The crop would hardly be more troublesome than a crop of Turnips.

WE observe with pleasure that a new work on "Sikkim-Himalayan Plants," by Dr. HOOKER, is preparing for publication, in a handsome folio volume, with 24 plates (uniform with "The Rhododendrons of Sikkim-Himalaya") and an illuminated title-page; the illustrations will be chiefly selected from drawings made in Sikkim under the superintendence of the late J. F. CATHCART, Esq., Bengal Civil Service, the botanical descriptions and analysis by Dr. HOOKER, and the plates in lithography by Mr. FITCH. It is announced that the principal object of the work is to introduce to notice a selection of Sikkim-Himalayan plants, which, from their beauty, novelty, and interest, are eminently worthy of cultivation in England; and, at the same time, to record the great services rendered to Himalayan botany by the late J. F. CATHCART, Esq., Judge in the Bengal Civil Service.

Attracted by the publication of the "Sikkim Rhododendrons," Mr. CATHCART visited Dorjiling, in the Himalaya, in 1849-50, with the view of furthering botanical science by employing artists, at his own expense, in delineating the magnificent plants of those mountains. During his residence there several artists were kept constantly at work under Mr. CATHCART's and Dr. HOOKER's superintendence, and coloured drawings of nearly 1000 plants were made. It was Mr. CATHCART's intention, on his return to England, to have published (also at his own expense), in conjunction with Dr. HOOKER, a very large selection of these, in the form of the "Sikkim Rhododendrons," but his lamented death (at Lausanne, in 1851), when on his homeward journey, frustrated this munificent intention.

His fine coloured drawings have been presented to the Museum of the Royal Gardens of Kew by Mr. CATHCART's sister; and it is from a selection of these drawings that Dr. HOOKER is preparing a botanical work, as a suitable tribute to the memory and love of science of his late friend.

From the great expense attending publications of this description, Dr. HOOKER (at whose risk it is undertaken) is obliged to regulate the number of copies struck off by that of subscribers; and as it is obviously impossible to keep the lithographic stones, he earnestly desires that persons who may wish to possess the work will oblige him by announcing their intention at their earliest convenience.

TIME was when cheating a Scotchman was about as difficult a feat as cheating a Greek. Time is, when a canny Scot is just as gullible as fat JOHN BULL himself. We are astonished at the degeneracy of our northern friends. Is it because the haggis has given way before roast beef, and good Scotch ale has surrendered to washy bitter beer? or is it that the Union, when it destroyed all national distrust, put an end to the other portions of a Scotchman's caution?

The north country trade in London-made guano seems to have opened men's eyes to the facility with which cheating may be made to thrive beyond the Tweed; and the ingenious gentlemen who live by plunder have not been slow to profit by the discovery. When it was found how eagerly loam, sand, and blue billy were bought for guano, it was a logical inference that salt might be sold for nitrate of soda, and gypsum for superphosphate of lime. Nor have dealers been slow to apply the inference to practice.

We learn from the Transactions of the Highland and Agricultural Society of Scotland, that Mr. GEORGE WILLIAM HAY, of Whiterigg, in Roxburghshire, being desirous of trying experiments with various manures in the cultivation of Turnips, put himself in communication with a person (the name we regret to say is not given) who proposed to deal in what are by courtesy called agricultural manures. Among the substances to be employed by Mr. HAY were superphosphate of lime, nitrate of soda, phosphate of soda, sulphate of potash, sulphate of ammonia, nitrate of potash, phosphate of magnesia, sulphate of magnesia, and muriate of ammonia. When the parcels of chemicals furnished by the respectable people of whom they were bought came to be examined, the nitrate of soda was found to contain only 56 lbs. of that substance in every 100 lbs., the phosphate of soda just 6 lbs. in the 100 lbs! the sulphate of potass 60 lbs., the sulphate of ammonia not quite 9¾ lbs.! the nitrate of potash about 11½ lbs., the phosphate of magnesia 2¾ lbs.! and the muriate of ammonia 5½ lbs. only. As to the superphosphate of lime, as it was called, it only contained 4 per cent. of soluble phosphate of lime; the other 96 lbs. consisted of water, gypsum, siliceous matter, some kind of free acid, and insoluble phosphate of lime, a perfectly useless substance.

When Mr. HAY ventured to complain of the fraud thus practised upon him he was coolly informed by the dealers that they could not think of taking their rubbish back; "it was the *usual quality* for agricultural purposes," of which we entertain no doubt, and contained the "*quantities suitable to plants*." That is to say, in the opinion of the dealers, the quantity which is *suitable for plants* is 2¾ lbs. in every hundred of phosphate of magnesia, 9¾ lbs. of sulphate of ammonia, 4 lbs. of superphosphate of lime, and 6 lbs. of phosphate of soda. The insolence of the answer was only excelled by the audacity of the fraud.

We, in the south, entertain a high opinion of the acuteness of Scotch farmers; but "no man is a hero in the eyes of his valet," and it would seem that the prestige of a Scotchman only attaches to him when away from home. The dealers who supply him with what is all important to his interests, find anything good enough for him, for he does not know when he is cheated, or if he finds it out he quietly pockets the affront. It is something new to learn that in Scotland discretion is regarded as the better part of valour.

Mr. HAY's account of his "experiments" is certainly one of the most instructive documents we have read. He tells us, not only what rubbish the "chemicals" are, which are sent into the Scotch market, but that the commonest substances prepared for farmers are little better. In that happy country it appears that animal charcoal is not what it ought to be; that London night-soil consists of the scrapings of the streets, with a little limestone and salt; and as to gypsum, it contains 40 per cent. of sulphate of baryta.

Mr. HAY says that many of his countrymen feel very sore at the adulteration of their manures, arising, as it does, out of their "well known gullibility;" and he bitterly laments the absence of any ready remedy. No remedy! then allow us to ask, What are agricultural associations, and chemical associations, and all other such combinations for? and what are Scotch law courts for? Are they myths, or soulless bodies, or mere *capita mortua*, that they cannot bestir themselves in cases like his? In England we should know how to find a remedy.

LETTERS from FLORENCE mention that a HORTICULTURAL SOCIETY has been established in that city under the Presidency of Professor PARLATORE. It is rather unfortunate that a different selection should not have been made; for Professor PARLATORE is not known as a physiologist or as a person conversant practically with rural affairs, although he has the reputation of being well acquainted with Italian systematical botany. We fear that our Italian friends are not well versed in the formation of associations calculated to improve the cultivation of their soil, or the crops which it is able to produce.

VEGETABLE PATHOLOGY.—No. XXIX.

130. Having now traced the progress of a plant through its several stages to its reproduction by seed, and shown what its several component parts are, and their mutual relations, we proceed in fatherance of our object to state the effects of external agents on their growth, whether as regards the requirements of health or as capable of producing disease. In treating of the functions of leaves and other organs, we have been obliged to touch more or less upon the subject, but not to such an extent as to make it needless to refer again to the subject.

131. The first of these external agents to which we shall advert is light, one of the most important elements in vegetable life; for there are very few plants, even of the lower orders, which can exist for any length of time in its absence; and any marked departure from the normal intensity requisite for each plant is sure to produce baneful consequences. Light, however, is by no means a simple body, for not only does it consist of a combination of rays of different colours and of different degrees of refrangibility, so that it acts differently according to its modifications, but independently of the heat with which it is usually accompanied when intense, there are certain rays which exercise a chemical agency, both as regards combination and decomposition. These chemical rays, it should be observed, communicate neither light nor heat; their greatest power is exerted beyond the violet portion of the prismatic spectrum, and the property gradually diminishes in approaching the green rays, and beyond this it is totally wanting. It appears, therefore, that the chemical rays are more refrangible than the violet, in consequence of which they are partly diffused throughout the blue, indigo, and violet rays*. It is obvious, therefore, that material effects as regards vegetation must be dependent on its modification—as, for instance, while some plants cannot sustain vitality except exposed to the full influence of direct or diffused solar light, others cannot flourish except under the shade of trees, where it arrives modified by its passage through the surrounding foliage, circumstances which are successfully imitated in the Fern and Orchis house at Kew, by painting the glass a light green.

132. Where light is altogether wanting, the proper fixation of carbon in the tissues and the attendant elimination of oxygen does not take place, no chlorophyl is formed, and the plant is therefore blanched, its cell walls weak, and the secretions which depend upon the perfect organisation and elaboration of the protoplasm of the leaves and young shoots are not formed, and consequently the stems, though succulent, are comparatively tasteless. These circumstances are taken advantage of by the gardener to render some plants available

* This is taken from the article Light, in the "Penny Cyclopædia."

for nutrition, which would otherwise be tough and rank, or even in some cases poisonous. Such bleached state of plants must, however, be regarded as diseases, for though in certain cases, if the bleaching has not been carried to too great an extent, the shoots will gradually, when exposed to light, acquire their proper green tint, yet in many cases they are past recovery, and so pass through the different stages of decomposition and decay. Any material diminution of the intensity of light can therefore be easily conceived as likely to prove injurious to many vegetables; and accordingly, where health is to be preserved, it is one of the main objects of the skilful cultivator to train and thin his plants in such a manner that every part shall have a due exposure to the light; and if this is not the case his fruit will be deficient in colour and flavour, and eventually the plant itself will acquire an unhealthy condition, which will soon manifest itself in some specific disease; for, as in the human frame, when once the mutual relations necessary to perfect health are disturbed, diseased action is sure to be set up in some form or other in those organs which, from constitutional peculiarities, are the weakest and most incapable of resistance, and where propagation takes place by constant division of a single individual, disease once acquired may be handed down for a century. *M. J. B.*

DEUTZIA GRACILIS.

Among the numerous introductions of late years, few have found more admirers than this charming Deutzia, and possibly none of our early flowering plants are more especially deserving of notice. It is easily cultivated, tolerably hardy, forces with the greatest facility if the wood has been properly ripened, flowers profusely even in a small state, and it may be had in bloom the whole of the early spring months. At that season the appearance of a well flowered plant, covered with numerous clusters of snowy white flowers, is sure to excite admiration; and the long duration of the blossoms render it especially adapted for the decoration of the conservatory, drawing-room, or, indeed, almost for any situation in which sufficient light and warmth is maintained.

So general a demand for this Deutzia has occasioned its being extensively propagated, and well-established plants may now be obtained of any nurseryman at a trifling cost. If procured at this time, the plants, if healthy and well rooted, should at once receive a tolerable shift, using a compost consisting of two-thirds turfy loam and one-third leaf soil, or other decomposed vegetable matter, adding a sufficiency of sharp sand to preserve the porosity of the soil. After potting, place them in a sheltered situation out of doors; and as they become established and commence growth, remove them by degrees to an open and airy situation, when the pots should be plunged to the rim, taking care to adopt some means of preventing worms, &c., obtaining ingress to the roots. Water as required, never allowing the plants to be checked, but encourage them to complete their growth as early in autumn as possible. If required for early forcing, I prefer removing them under cover before heavy rains or severe weather sets in; being deciduous, they occupy but little room in a corner of the greenhouse or other convenient place, where they should be watered sparingly, but sufficient quantities should be given to prevent the ball from becoming dry.

If started in time, plants may be had in flower in February; for this purpose, early in December they should be cleaned and top-dressed, pruning out or shortening any superfluous shoots, but bearing in mind that the flowers are produced most copiously on well ripened moderate growth of the present year. When the wounds have dried, remove the plants to a temperature of 50° to 55°, and place them near the light. Water when required, and occasionally on fine mornings give a gentle sprinkle with the syringe. As they advance, the flowering shoots will be readily perceived, and should be tied and regulated accordingly. When the flowers begin to expand remove the plants to a cooler situation: this will make room for a second batch, which should by that time be progressing.

After the plants have finished flowering remove them to a warm greenhouse to complete their growth, giving them a shift if necessary preparatory to hardening them off, and placing them out of doors, when all danger of frost is over. They will bloom much earlier the second year than they did the first. If not required for early forcing the temperature of a warm greenhouse will induce them to flower early in April; after blossoming they may be treated as previously directed.

Cuttings of this plant root freely in spring; use young side shoots 3 or 4 inches long taken off with a heel attached to them. Place them in a pot filled with a light sandy compost, cover with a bell-glass, and set them in a close warm pit or frame, in which, if there is a gentle bottom-heat, so much the better. When rooted, pot them singly into 3-inch pots, and place them in a close frame, and as the pots become filled with roots give a second shift, and afterwards harden them preparatory to turning them out of doors, where, with due attention, they will grow much stronger than if kept under glass. To flower strongly they should be grown a second season before they are forced, and by that time, if well treated, they should be well established plants in 8 or 9 inch pots. They will, however, flower well in pots of a much smaller size, but they should not be kept more than one year without shifting; therefore where small plants are desired it is preferable to propagate a few each season, planting out such as have become too large to be kept conveniently. *Alpha.*

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVÉLIERE, NANTES.—By Himself.

(*Continued from p.* 437.)

Poire Prince Albert.—Tree vigorous, and succeeds both on the Pear and Quince stock. It naturally takes the pyramidal form. Fruit middle-sized, pyriform, 3½ inches in length, and 2⅜ inches in diameter. Stalk about an inch in length. Eye small, open, placed in a shallow evenly-rounded cavity. Skin very thick, smooth; ground colour pale green, becoming yellowish when ripe, sometimes slightly coloured next the sun: it is tinged with red near the stalk, elsewhere distinctly marked with reddish spots and sprinkled with black dots. Flesh yellowish-white, fine, melting, with a rich sugary flavour. Season, February and March. This delicious fruit was obtained by M. Bivort, from one of the trees raised from seed by Dr. Van Mons, and which fruited for the first time in 1848.

Van Marum. — Tree vigorous, and an abundant bearer, suitable for a pyramid, and succeeds on the Pear and Quince stocks equally well. On account of the size of the fruit, we have thought the tree worthy of trial against a wall.

The size of the fruit is enormous, 7 inches in length, and 12 inches in circumference, calebasse-shaped. Skin bronze-coloured, brighter where exposed to the sun. Stalk very short, thick, fleshy, but sometimes it is long and slender; it is inserted in a small narrow cavity. Eye open, in a wide speading hollow, surrounded with small plaits. Flesh white, coarse, fibrous, breaking, with but little juice, sweet and perfumed. Season October. This superb fruit was obtained by Van Mons, in 1820, and was named by him in compliment to the eminent Dutch chemist, Van Marum.

Désiré Cornélis. — Tree pyramidal, vigorous, productive, thorny, its branches extending almost horizontally. Fruit large, nearly 4 inches in height and 3½ in diameter. Stalk rather more than an inch in length, somewhat oblique. Eye open, shallow, surrounded with small projections. Skin rough, pale green, becoming yellowish as the fruit approaches maturity, spotted with light brown, slightly tinged with red next the sun. Flesh very fine, white, buttery, melting, with abundance of sugary, perfumed juice. Season beginning of September. Raised by M. Bivort.

Poire Deux Sœurs.—Tree vigorous, pyramidal, thorny, and an abundant bearer. Fruit large, pyramidal, long and tapering to a point, 4¾ inches in length, and half as much in diameter, ribbed towards the eye. Stalk upwards of an inch in length, of moderate thickness. Eye slightly sunken. Skin pale green, speckled with brown, interspersed with black dots. Flesh fine, yellowish green, buttery, moderately juicy, very sugary, leaving, after tasting, a decided nut or almond flavour. Season, November. The tree was found in a garden at Mechlin, and named by Major Espéren, but at what period we do not know.

Bergamotte Espéren.—Tree vigorous, somewhat thorny. Fruit middle-sized, Bergamot-shaped. Stalk nearly an inch in length, slightly curved. Eye in a shallow depression, surrounded with small knobby wrinkles. Skin rough, green, becoming yellowish at maturity. Flesh white, tinged with pale rose-colour, very fine, melting; juice abundant, sugary, and agreeably perfumed. Season, March and April. This delicious fruit is one of the many seedlings raised by Major Espéren.‖

Home Correspondence.

Vine Pruning.—Some time ago I mentioned a controversy in your Journal about the propriety, or otherwise, of pruning forest trees with the view of accelerating the growth of timber. The theory I then adopted was —that the increase of stem in a timber tree depends on the reciprocity between the roots and branches, and in whatever degree that reciprocity is disturbed by lopping or pruning, in like degree will the increase of stem be checked or retarded. I think, after much writing *pro* and *con*, the above theory came to be pretty generally admitted. I refer to it now, because a doubt has arisen in my mind whether I have not been acting in violation of my own theory, not as regards forest trees, where I feel satisfied, but in the management of Vines. I have been a tolerably successful Grape grower for many years, and have generally adopted the spurring system (so called). Now I had lately, with some intelligent neighbours, a conversation, part of which turned upon the difference between a Vine being confined to one rafter and spurred, and by another mode, one Vine filling a whole house, such as the Hampton Court Vine, and others like it. One of my friends remarked that when a Vine is suffered to grow so as to spread over a whole house, its roots grow in proportion to the branches, whereas by spurring, and thereby cramping the upward growth, you check the growth of roots in a like proportion; on hearing such remark, it at once occurred to me that by spurring Vines I was acting contrary to my own theory. Now is that the case—or does the ripening a crop of Grapes promote the reciprocity in kind or degree, so as to have the same effect on the production of roots that the growth of wood would have? I have my doubts. What say physiologists—or what say you Mr. Editor? *Quercus.* P.S. There appeared in your Paper, a good while ago, some silly questions, by some one who adopted, or rather usurped my cognomen, which I beg to protest against, as it would make me look foolish in the eyes of those who know who "Quercus" really is.

Gooseberry Caterpillars.—Mr. Booth's account of these pests induces me to state a remedy which I thought everybody knew, but which too few practise. There is no incursion of the caterpillars from a distance, they invariably breed in the bush upon which they commit their ravages, and the simplest remedy, I believe, is, from time to time, on the leaves coming out, to look over the bushes, and gather off the leaves, which the young brood, just emerged from the egg, have eaten into those pin-holes which render the leaves so dissected very conspicuous. They are generally found on the under and lower parts of the bush, and one leaf gathered destroys from 30 to 50 caterpillars. A very little time is required to examine many bushes; it is not work, but rather watching, which must be repeated as long as the fly is depositing eggs — perhaps for a month. If you allow the brood to spread over the bush, your labour is endless, and your success imperfect. *Thomas Brown, Cirencester.*—— Quick-lime, recommended in your pages some years ago, is a good remedy for these creatures. I apply it round about the bush (but particularly close to the stem) some time in February, and let it slake of itself; I then have it well forked into the surface about the latter end of April. I do not find it necessary to do this every year—perhaps once in three years would prove sufficient (take care to have good quick-lime). Your advice is good as to pinching off the end of the shoot to destroy aphides, but if I were "R. V." I would throw a cloth over a dozen or two of the bushes, and give them a good fumigating with tobacco smoke; if this answered he could carry it further, and the trial would cost but little; if he succeeds, I hope he will report his success, for the benefit of others. *T. H.* ——The ravages of the Gooseberry caterpillar alluded to by your correspondents might have been prevented by one or two timely dustings of hellebore powder applied with a dredging-box when the bushes were quite dry. This remedy is neither expensive nor troublesome, and I have never known it to fail. I only know of one better plan, and that is to place a coop or two of young Cochins amongst the bushes as soon as ever the caterpillars appear. If any of the latter have already ascended the bushes, brush them carefully off and crush them; and depend upon it the chickens will allow no more to ascend. No fears need be entertained of their scraping propensities when under six or eight weeks old, and they will not travel far from their coop; but should there be any young Cabbage or Lettuce plants in their immediate vicinity, they, as well as the caterpillars, will quickly disappear. *G. P.*—— To get rid of caterpillars and aphides take two large watering pots that will hold about 4 gallons each; put into one of the pots, 1 quart of soft water, a common table-spoonful of spirits of turpentine, and one of soft soap (heaped up); let a man stir up the mixture until the soap be dissolved, then fill up the pot with water. Let one man take a good syringe and empty that pot, whilst another gets the other pot mixed; let the two men thus proceed in good earnest for 12 hours, and the result will speak for itself. *T. F.*

Effects of the Winter at Singleton, South Wales.— Singleton is 209 miles west of London, and 84 miles west of Bristol; it stands close upon the sea, facing the south, and lies as it were in a curve between two hills projecting into the sea on its eastern and western sides; these hills no doubt afford us great protection, but we are exposed to the S.W. sea breezes, and being within two miles of patent fuel works on the east, we occasionally suffer from the effects of the smoke. This has been the most severe winter we have had for many years; during January we had from 7° to 16° of frost, and in April from 4° to 7°. Notwithstanding, our Coniferæ, &c., have escaped with much less injury than in many places. Cunninghamia sinensis, 32 feet high, another 18 feet high, both very handsome plants, have had the tips of some of the branches slightly cut, but are now growing fast; these were not protected, but their situation is well chosen, both being surrounded by plantations. Cryptomeria japonica, 14 feet high, and 8 feet through at two feet from the ground, is a remarkably handsome plant, its rich branches sweeping the ground, foliage very dense and thick, and the plant itself perfectly conical. I believe it to be the variety called Lobbi; at all events, its dense and thick style of growth is very different from C. japonica, as usually seen. Picea pinsapo, 15 feet high, 7 feet through, and very handsome, lost some of its foliage from the upper branches, either from the effects of cold or smoke, but it is now doing well. A very fine Araucaria brasiliensis, 13 feet high, and protected during the severest frosts, has been slightly cut, but is now doing well. Cupressus torulosa, pendula, sempervirens, and thyoides; Juniperus chinensis and excelsa, all from 16 to 18 feet high, are uninjured. The foliage of the following kinds were all more or less browned:—Pinus Devoniana, 5 feet high; Hartwegi, 4 feet 6 inches; macrophylla, Russelliana, patula, Montezumæ, Gerardiana, radiata, Grenvilleæ; californica, insignis, 8 feet high; cembroides, and Sequoia gigantea (Taxodium sempervirens), all suffered apparently from exposure, but are now doing well, although they are late in making their growth, as all Pines are this season. Picea Nordmanniana, a fine hardy kind; nobilis, grandis, Fraseri, Sabiniana, Abies Brunoniana (very pretty) stand well with us. Abies Menziesi, Jezoensis (small), halepensis; Benthamiana, 4 ft. 6 in. high, handsome plants, growing freely with us; Cembra, Llaveana and Edgariana, as well as all the above, have stood the winter perfectly, as have also the following: Fitz-Roya patagonica, Saxe-Gothæa conspicua, Libocedrus chilensis, Taxus Dovastoni, elegantissima, fastigiata, argentea variegata, Thuja flagelliformis, sinensis,

occidentalis, variegata, plicata, pyramidalis, Warreana, pendula, and aurea; the gold-like appearance of this has a very pretty effect when placed near plants of dark foliage. The pretty little Fern-like Thuja Doniana has stood with us, well sheltered by trees and protected by cut branches. Juniperus Bedfordiana, chinensis, excelsa (small), macrocarpa, recurva, oblonga-pendula, tetragona, &c., Cupressus Goveniana, funebris (this has never done well with us, being probably effected by smoke, or the sea breezes); torulosa, elegans, Knightiana, and macrocarpa have all wintered satisfactorily; the rich dark foliage of macrocarpa is very attractive, and from the fact of its being a rapid grower, I have no doubt it must become a universal favourite. Small plants from the nurseries, about 18 inches high, planted here in April, 1850, are now 16 feet high and 3 feet 6 inches through: to my fancy no plant is better adapted for avenues than this. Cedrus Deodara, robusta, and africana have not suffered in the least, but they will not stand the sea breezes; Araucaria imbricata is not affected by the sea breezes; Abies Douglasi has never succeeded well with us till the present season, the young shoots were annually killed just as they began to grow in spring; but so far, this year, they look very well, some of their leading shoots having grown 9 inches. Many of the young shoots of Rhododendrons were completely cut off by the frost on the 24th of April, as well as some of the young growths of Picea Webbiana and cephalonica; Abies Morinda also suffered. Of other rather tender plants which have stood the winter here for many years may be mentioned the Benthamia fragifera, Arbutus Andrachne, 10 feet high and 10 through; A. procera has produced ripe seeds very freely for several years; Aloysia citriodora, or the sweet-scented Verbena, is 20 feet high, against the house, as is also Pittosporum Tobira, which I may say is in bloom the year round, scenting the air with its sweet flowers; Edwardsia grandiflora grows well, and flowers freely. Camellias and Myrtles grow and bloom freely, but they suffered considerably this year. Mr. Veitch's evergreen Escallonia macrantha, which grows very fast and flowers most profusely, has not suffered in the least; it is a fine thing, and deserves a place in the smallest garden. *William Barron, Singleton, near Swansea, July* 14.

Potatoes in Scotland.—The disease has now manifested itself in a virulent form among Potatoes in an open border in a garden in this neighbourhood. The taint made its appearance on the leaf between two and three weeks ago, and on examining the tubers a few days back the greater proportion was found injured. Part of them are Ash-leaf Kidneys; the others are apparently some later sort; but all are alike diseased where first planted; and another border, which was a little later, has for nearly two weeks been sightly affected on the leaf, and is gradually getting worse every day. As yet field crops appear to be safe, but if we have a continuance of the wet weather we are now experiencing, it is much to be feared the disease will extend itself. *D., Ramornie, Cupar Fife.*

Galvanised Iron Wire.—About 18 months ago, I adopted the plan of running galvanised iron wire through loops driven into my fruit walls, and then training the fruit trees, by fastening the branches to these horizontal wires, with leaden string. My gardener complains that wherever the branch comes in contact with the wire it cankers, and finally destroys the branch. Have you heard such a complaint before, or is it some mismanagement on our part? *Jacobus, Shorncliff Lodge, Sandgate.* [This is a common complaint, and has been adverted to at p. 104 of our present volume.]

Nectria inaurata. — I have had occasion several times to direct attention to the varied mode of fructification which prevails in the same individual fungal, and to the extended observations which have been made, more especially by M. Tulasne, on this subject, and have also recorded the curious discovery, by Mr. Broome, of two distinct sets of organs in the same hymenium, the one producing sporidia within distinct asci, the other large naked spores, without any surrounding membrane. The same gentleman has just forwarded to me a still more curious case, in which the same hymenium produces two sets of asci, differing from each other in form, and containing totally different sporidia; the larger clavate asci, for example, filled with myriads of minute curved sporidia (fig. 3) not exceeding .00015 of an inch in length, and endowed with molecular motion so active as to make their admeasurement somewhat difficult; the smaller cylindrical asci, containing only eight elliptic larger uniseptate sporidia .0005—.0006 of an inch long (fig. 2), furnished at either extremity with a delicate hyaline appendage. The first impression was, notwithstanding the difference of the form of the asci, that the more minute bodies might possibly be fecula, at the expense of which the larger sporidia were formed. But besides the perfect resemblance of the minute curved sporidia to those of very many fungals belonging to different genera, the application of a solution of iodine and sulphuric acid produced not the slightest change of colour; while sugar and sulphuric acid gave rise, in a few minutes, to a beautiful rose tint in the contents of both the clavate and cylindrical sacs, when seen *en masse;* though in the individual granules the tint, though I believe certainly present, is so delicate as to be scarcely distinguishable. The species of *Nectria* in which these twofold asci first occurred is apparently of frequent occurrence, as I have received it from several quarters, though it is at present undescribed, in consequence of its having been confounded with *Nectria aquifolii*, from which it may be known by its less cup-shaped brownish perithecia, thickly clothed with ochraceous granules and appendiculate sporidia, while those of *N. aquifolia* are of a different form, and have no appendage, as will be seen by fig. 4. Similar fructification was found subsequently, though more sparingly, in *Nectria cucurbitula*, a nearly allied species with a more ruddy tinge, and, in consequence of the want of the golden gamboge yellow veil, very different general aspect. Its large sporidia, which are identical in form and nature, vary in in length from .0004‴—.0005‴. A careful scrutiny of dead Holly twigs will probably enable any of your readers to verify Mr. Broome's observations. The species, being undescribed, may be characterised—*Nectria inaurata*, Berk. & Br. cæspitosa, peritheciis globoso-depressis olivaceo-fuscis quandoque rubro-tinctis flavo-pruinosis, ostiolo papillæformi, demum impresso nudo atro-fusco; ascis sporidiisque biformibus, aliis clavatis sporidiis minimis innumeris curvulis; aliis cylindricis sporidiis octonis ellipticis utrinque appendiculatis. On dead twigs of Holly. Our figure represents—

1. A group of clavate cylindrical asci, magnified; 2. Sporidia from clavate asci, highly magnified; 3. Sporidia from cylindrical asci, still more highly magnified: 4. Sporidia of *Nectria aquifolii*, magnified to the same degree as No. 3.
M. J. B.

Kennington Park.—Permit me to inform you that your correspondent's account of this park, at p. 438, bad as it certainly makes it, fails to represent its many imperfections. In my opinion (and I have had considerable experience in such matters), the whole design and arrangement of this fine piece of land are extremely faulty, exhibiting an attempt at landscape gardening in the present age that is disgraceful to all concerned in it. It is perfectly destitute of every feature of skilful display, either as regards convenience or ornamental effect. It is intersected by unlevel puddle-holding walks, some of them unsightly and crooked, others leading to nothing and nowhere, and all putting one forcibly in mind of the hap-hazard windings or track of a blindfolded man in a wheelbarrow race. Their unmeaning curves and awkward corners come continually in one's way. Sweeps and counter sweeps have been formed without harmonising in the least with each other; such incongruity always offending instead of pleasing the eye. The trees and shrubs, too, as your correspondent has stated, are of the most wretched description, and such as no practical man would ever think of buying or planting. Their variety is also extremely limited, the most common-place things being employed, and these mostly deciduous, and apparently the very outcastings of some overgrown unsaleable nursery stock. In place of a lasting embellishment they will remain a permanent disfigurement, stunted and unsightly, and exhibiting every deformity of shape caused by their over-crowded position in the nursery; now they will not be recoverable for years, and thousands of them never will, to say nothing of what are dead or dying. It is evident that their selection and arrangement can never have been effected under the superintendence of any one having the least pretension to professional experience. Their arrangement, if possible, is even worse than the condition of the plants themselves; for they are distributed higgledy-piggledy, without regard to heights, habits, or colours; and the want of good common hardy evergreens is everywhere apparent. In metropolitan improvements of such importance as this, under legislative control and purse, the public naturally expects that competent parties should be appointed to carry out the work, and that the best materials that could have been had would have been employed; but the contrary is the fact here. Your correspondent states that the plants are only fit for the faggot heap, and if I were called on to add my testimony, I would say, pull up the greater portion of them, and commit them to the flames at once, and let their places be filled with better materials in proper health and habit, and thereby save years of delay in furnishing the park properly. Altogether I can only pronounce this park and its arrangements to be a piece of bungling, only complete in that particular, and a good example of reckless national expenditure. *A Practical Man.*

Societies.

ENTOMOLOGICAL, *July* 3. — The President in the chair. Amongst the various donations received by the Society since the last meeting were 50 species of British Lepidoptera, new to the collection, presented by Mr. Allis; also the second volume of M. Boheman's elaborate monograph on the Cassidæ. The President announced that a new part of the Transactions was ready for distribution among the members. Mr. S. Stevens exhibited a nearly full-grown larva of Notodonta Carmelita, which he had succeeded in rearing from eggs deposited by a female which he had captured in Sherwood Forest. A handsome beetle, Pyrochroa pectinicornis, new to this country, was exhibited by Mr. Stevens, having been captured by Mr. Buxton in Scotland; also two or three species of new microlepidoptera captured by the same person. He also exhibited a specimen of the extremely rare and singular beetle Damaster Blaptoides, a native of Japan. Mr. Janson exhibited a variety of good lepidoptera and coleoptera taken in Scotland by Mr. Foxcroft, intended for distribution amongst the subscribers to his excursion; also a variety of rare Coleoptera collected by himself during the Darenth excursion of the Society in the preceding month, as well as six specimens of the very rare Hypulus Quercinus recently taken at Colney Hatch. A number of specimens of the new Irish burnet moth, Anthrocera Minos, from Galway, were sent by that gentleman for distribution among the members. Mr. Douglas exhibited a new species of Lithocolletes, reared from the Vaccinium Vitis Idea. Mr. F. Smith exhibited some new and very rare British Hymenoptera, including Nomada armata, a species in the British Museum collection which had been considered as one of Dr. Leach's doubtful and incorrectly introduced species. By degrees, however, most of the insects on which doubts had thus been cast were being captured; amongst which it was mentioned that several specimens of the fine Carabus intricatus had been taken in or near to Leach's asserted locality, Spitchweek Park, Devonshire. Mr. Stainton called attention to a memoir on new Swedish insects by Boheman, amongst which was contained the description of a new Nepticula, a genus of lepidoptera, which Mr. Stainton had captured in this country, and regarded as Trichopterous. Mr. Waterhouse read some notes on Amycterus, a genus of weevils from New Holland, and Mr. Westwood the descriptions of four new species of Paussidæ, contained in the collection of the Royal Museum of Stockholm, and in that of M. Dohrn. He also communicated some notes by Mr. Varney, on the habits of wasps, earth-mining bees, rose-mining caterpillars, &c. A discussion arose on the question whether wasps use the scrapings of solid wood in the construction of their nests, an opposite opinion having been maintained at a meeting of the Microscopical Society. Extracts from a letter from Mr. Wallace, who had arrived at Singapore, and had already collected as many as 80 species of butterflies, were communicated by Mr. S. Stevens.

CALEDONIAN HORTICULTURAL.—At the late spring competition the following prizes were awarded:—Stove or greenhouse plants: 1st, Mr. Ritchie, Parson's-green, with Epacris miniata; 2d, Mr. Reid, Millbank, with Eutaxia myrtifolia. Six stove or greenhouse plants: 1st, Messrs. Dicksons & Co., with Epacris grandiflora, Bossiæa linophylla, Allamanda neriifolia, Rhododendron javanicum, Tropæolum tricolorum, and an Indian Azalea. Finest three greenhouse plants: 1st, Mr. Reid, with Bossiæa linophylla, Aphelexis macrantha purpurea, and Boronia tetrandra; 2d, Mr. Ritchie, with Polygala Dalmaisiana, Pimelea decussata, and Adenandra uniflora. An extra award was voted to Mr. Smith, Melville Castle, for Epacris lævigata, Leschenaultia formosa, and an Aphelexis. Cape Heaths: 1st, Mr. Smith, with E. ventricosa, tricolor, and Willmoreana; 2d, Mr. Ritchie, with E. ventricosa, coccinea minor and perspicua nana. Climbing Plant: 1st, Mr. Reid, with Kennedya monophylla; 2d, Mr. Thompson, Lasswade, with Tropæolum tricolorum grandiflorum. Azaleas: 1st, Mr. Reid, with optima and variegata; 2d, Mr. Edwards, Lauriston, with Cupid and lateritia. Rhododendrons: 1st, Mr. Laing, Dysart, with a variety called Beauty; 2d, I. Anderson, Esq., with R. formosum. Cinerarias: 1st, Mr. Reid, Broomfield, with Lady Hume Campbell, Climax, Bessy, and Marianne; 2d, Mr. Laing, with Advancer, Etiole de Vaise, Lord Stamford, and Scottish Chieftain. Auriculas: 1st, Mr. Henderson, Cargilfield, with Ne plus ultra, Green Hero, Glory, Mary Ann, Ringleader, and Prince of Wales; 2d, Mr. Forrester, Ratho, with Colonel Taylor, Lord John Russell, Ne plus ultra, Ploughboy, Standard of England, and Green Man. Messrs. Dicksons & Co.'s prize for Indian Azaleas was gained by Mr. Cameron, Trinity Cottage, with fine plants of præstantissima, lateritia, magnifica, alba, and Addisoni. An extra award (Silver Medal) was voted to Mr. Edwards, for Holfordiana, præstantissima, optima, and Egertoniana. Among articles not sent for competition were Ferns and Lycopods, and a flowering plant of Primula Stewarti, from Mr. Stark; Andromeda formosa, Lilium colchicum, Genethyllus fuchsioides, &c., from Comely Bank; Mimuluses Scarlet Defiance and Queen Victoria, as well as blooms of Pansies, &c., from Messrs. Downie and Laird; a bunch of Asparagus (25 heads), weighing 25 oz., from Mrs. Carstairs; preserved blooms of Rhododendron Dalhousiæ, from Mr. Laing, Dysart House; and a Seedling Rhododendron (a hybrid between hirsutum and formosum), and a flowering plant of Rhododendron lepidotum var. elæagnoides, from I. Anderson, Esq., Maryfield.

BOTANICAL OF EDINBURGH, *June* 11.—The President in the chair. Several donations were announced. From D. Oliver, Esq., was a strip of the bark of Prosopis juliflora, the Cashaw, received from Jamaica, along with a note, stating that the plant is one of the commonest trees in the savannahs, and one of the hardwood Acacias. It yields a fine bitter, and is used by the people as a substitute for Cinchona. It is employed in certain chronic inflammations of the throat, and is said to be superior to Peruvian bark in its medicinal effects. The wood is constantly used for fuel. From Messrs. W. and G. Law were specimens of raw cocoa, ground

cocoa, roasted cocoa, rock Trinidad, or navy cocoa, cocoa nibs, Fry's chocolate, and a specimen of tea known as Assam dust, which was stated to be scarcely known in commerce, and unnoticed by writers on teas. Messrs. Law remarked that it was a substance produced by friction during the process of preparing the tea. Leaves that are solid and heavy are the tenderest and break the easiest; hence the quantity of dust in Assam tea. This dust is too valuable to be thrown away, as it is often added to give strength to tea. The following papers were read:—1. On the Structure of Diatomaceæ. By E. W. Dallas, Esq., F.L.S. 2. On the various sections of coal, considered in their relation to the block, and the relative views of histologists thereon. By Mr. Neil Stewart. 3. On the effects of the recent frosts on vegetation, in different parts of the country. By Mr. M'Nab. The following candidates were balloted for, and duly elected:—W. Falla, Esq., Ordinary (Resident) Fellow, and Mr. G. Morris, Associate.

Hitcham Horticultural, *June* 27.—We are glad to learn from the judges' report on the cottage allotments connected with this useful society, that the allottees are improving satisfactorily in the management of their little plots, and that they now begin to find out the advantages of the system. Of the benefits arising from cleanly and careful cultivation, the report gives the following remarkable instance:—The culture of six Flour-ball Potatoes by three of the parties to whom Mr. Freeman had presented them, produced the following results. No 79, W. Baker, jun., obtained 35½ lbs.; No. 1, Jos. Knock (by water-run) 22½ lbs.; No. 44, George Gardner, 21½ lbs. The average here obtained is 26⅔ lbs. from six moderate sized Potatoes! But the average obtained by three others who had not taken any pains with their culture was only 5⅔! W. Baker, jun., has supplied the following memorandum. April 2. Prepared 3 bushels composed of cinder-dirt, ashes, night-soil, and old brick mortar, and dug it in; then trenched in the Potatoes, two whole, two in halves, and two in eight pieces with two eyes to each. July 29. The leaves began to spot with disease. Aug. 16. Cut the haulm close to the ground and covered the ridge with fresh mould. The produce, as mentioned above, was taken up and weighed in the presence of the judges. The judges offer the following suggestions in addition to their former advice. 1. To dig deep, and well pulverise the soil. 2. Not to apply raw manure. Burnt wood, or vegetable refuse is excellent. 3. Special attention to be paid in not planting the sets less than 15 inches apart.

New Plants.

71. Sabbatia stellaris. *Pursh.*

A beautiful herbaceous plant, produced at the last Chiswick show by Mr. Ingram, from Frogmore. It is about a foot high, with opposite oblong leaves, and long-stalked very sweet flowers, about a couple of inches in diameter. The corolla is deep rose colour, with a yellowish green star-shaped eye. Although well known to botanists, neither this nor any other kind of Sabbatia has before occurred to us in cultivation; and Mr. Ingram may claim much credit for having shown how such plants are to be managed. It naturally occurs, according to Dr. Asa Gray, in *brackish* meadows, from Massachusetts to New Jersey and southward. It therefore demands a very warm season of growth, and Mr. Ingram grows it accordingly in a greenhouse. Gardeners are too apt to forget, when they hear of the great severity of winter in the United States, that the summers are on the other hand Neapolitan; and there can be little doubt that the reason why so many of the beautiful perennials of North America refuse to live with us, is that we turn them out of doors to experience the rigour of our wintry summers.

Garden Memoranda.

Messrs. Lane's Nursery, Great Berkhampstead, Herts.—The most prominent feature of this establishment is, as a matter of course, its Roses; but it also contains an excellent stock of such trees, shrubs, and plants as are to be found in ordinary nurseries, and it is to these the following remarks are intended chiefly to apply. In a long half span-roofed house near the entrance was a collection of Peaches and Nectarines, Plums, Cherries, Pears, and even Apples in pots; and elsewhere we observed Apricots, Gooseberries, and Currants grown successfully in the same way, the two latter being well furnished with ripe fruit. On one of the Plums (St. Martin's Quetch) were 36 fruit, and the plant was not more than 2 feet in height, and in a 10-inch pot. The Jefferson, a first-class Plum, also grown in this way, was producing a few fine fruit. A little tree of the Stanwick Nectarine had 12 fruit on it; on a Peach we counted 14, and a small tree of the Hawthornden had 8 Apples on it. Of the condition of Cherries in pots, those who had the good fortune to be present at the great metropolitan exhibitions had an opportunity of judging. Though grown in this way, the fruit is large, juicy, and well flavoured. The advantage of having an orchard-house in an unfavourable season like the past will therefore be apparent, in addition to the interest which belongs to the cultivation of dwarf trees in pots. The house in which these fruits are can be warmed when wanted; it stands up and down a steep hill, and, as hot water could not be made to circulate in it, it has been Polmaised, the narrow sunk passage in the centre acting as a cold-air drain. A pit, running parallel with this house, was filled with Camellias, fine young plants, which promised to be well set with bloom.

Lower down the hill were other plant-houses. One was occupied entirely with "Union Azaleas," *i. e.*, the kinds variegata, lateritia, and Gledstanesi worked together in one plant, which when in bloom produces, by means of its many-coloured flowers, an interesting effect. In another house, the fine specimen Azaleas which have been so successfully exhibited at our great London shows were placed to ripen their wood, these houses being at present kept a little close and warm. In a third long span-roofed house were plants of all the different sorts of Achimenes, among which the pure white A. Margarettæ, with blooms nearly as large as a five-shilling piece, was most conspicuous. The atmosphere of this house being cool and dry, the blossoms not only of this, but of other kinds, were quite free from the slightest spot or blemish, from which it is difficult to keep them in a damp place, or where bees are admitted to puncture and bruise them, which soon impairs their beauty. Here were also the different kinds of variegated Pelargoniums, in quantity, and many excellent scarlets, both French and English. We also observed several French "fancies," similar to those which Mr. Gaines has been showing, and which originated, we are informed, at Bellevue, near Paris. A second division of this house was filled with the better kinds of Fuchsias, including Duke of Wellington, a new and handsome dark sort.

In a span-roofed orchard house, 130 feet in length, and 26 feet in width, with one side and end open, the other end a Privet hedge, and the second side a low brick wall, were more dwarf fruit trees in pots, which, however, refuse to ripen their fruit while the house is so "drafty" and open, and, therefore, Mr. Lane intends to close up the sides, and then Polmaise it. With that end in view Vines have already been led up the rafters. They are planted outside in round pillar-like heaps of turfy loam, set on the surface of the ground, the Vines growing out of the tops of them, about 2 feet above the ground level; and fresh soil is, we believe, to be added annually, in proportion as the roots extend. Among Figs in pots, and other occupants of this house, were different kinds of yellow Rhododendrons, of which there is here an excellent collection, and many very fine standard Portugal Laurels, which have of late years been much enquired for to place along the sides of terrace walks as a substitute for Orange trees. Of these there were also some fine specimens in the open ground. They have clean stems, from 6 to 8 feet in height, in order that when the heads shall have become large a fair proportion between stem and head may be preserved.

Among hardy evergreen shrubs, a small silver striped Box might be found useful for many purposes, and should not be lost sight of by collectors of variegated plants. Daphne japonica variegata is also a hardy kind, which every garden should possess, being sweet and well suited for open air culture. Of weeping trees we remarked some interesting examples, more especially of Beech, Birch, Ash and Elm. Of the last there were several varieties. Among Oaks the striped Turkey, though not weeping, is very handsome, on account of its fine foliage. Of Deodars there were large plantations of very fine plants, not only down in the low ground near the canal, but also high up on Berkhampstead Common. Those in the valley lost their young wood from spring frost; but on the hill are great numbers of plants in the most robust health, that have sustained little or no injury. Abies morinda has been hurt by the winter; not so have P. insignis, excelsa, Fraseri, Montezumæ, and others. P. cephalonica is injured, while P. nobilis is unhurt. The Hemlock Spruce has stood well, as has also Juniperus stricta. The Golden Thuja (T. aurea) has been injured a little, as have also been young plants of Araucaria imbricata, but examples of this Araucaria from 3 to 5 feet high (and of which there are great quantities) have not suffered in the least. Taxodium sempervirens has been browned in places, and Laurustinus has been killed to the ground.

The light loamy soil of Berkhampstead Common appears to suit Rhododendrons perfectly; for plants here, in nothing else, are healthy, and bloom every year as well as if they were in peat. Ghent Azaleas also succeed in it. Among the Rhododendrons were multitudes of standards consisting of the finer varieties worked on stems from 4 to 8 feet in height, and which, when their heads shall have grown large enough, must when in bloom have a striking effect.

Concerning Roses, it may be mentioned that the fine specimens in pots that so justly obtained first prizes everywhere this year have all, with the exception of the Teas, which are under glass, been plunged in raised beds of sawdust out of doors to ripen their wood. Among Teas Madame Willermorz is a good new rose white, with a tinge of salmon in the centre. Mère de St. Louis (H. P.) is also a promising kind, which must certainly become a favourite. The Manetti stock, it may be mentioned, is not liked here; it pushes too early in spring, and the young growths get killed by late frosts. Pears on the Quince stock, too, do not seem to suit this locality, most of them being unhealthy in appearance. Such as are on Pear stocks succeed better.

FLORICULTURE.

The Cineraria.—Flowering from Christmas to June, and forming handsome specimens for decorative purposes at a comparatively small expense, both as regards attention and accommodation, and also furnishing a profusion of finely-shaped many-coloured flowers for bouquets (which the Cineraria does), it well deserves to be, as it is, one of the most popular flowers of the day. It is of easy culture, and in most cases is well managed; but, nevertheless, in some instances (where ample means exist, and also doubtless a desire to produce respectable specimens) it exhibits effects of the worst possible treatment. The following hints may enable such growers to produce creditable examples of this extremely useful plant. The ordinary method of propagating the Cineraria is by root suckers, which are produced abundantly by plants after blooming, when placed in a shady situation and properly attended to with water. The old plants should be broken up as early in August as suckers can be had strong enough; the latter should be potted singly in 4-inch pots, and placed in a shady part of a cold frame till well established, which will be in less than a fortnight. The plants should then be placed near the glass, and receive abundance of air, with a view to secure "stocky" growth. During autumn, and until severe weather occurs, a cold frame will form the most suitable situation for promoting rapid growth; but some attention will be necessary not to wet the foliage any more than can be helped, and also to avoid cold currents of air, which turn the leaves foxy, and greatly injure the plants. At the same time, however, admit sufficient air to prevent weakly growth. Water should be applied early in the day when necessary, giving a good soaking, and air admitted on the sheltered side of the frame, to dry the atmosphere and foliage. During autumn and winter, the Cineraria is somewhat liable to mildew, especially some varieties; keep, therefore, a sharp out-look for this enemy, and apply sulphur the moment it appears to the parts affected. Mildew is greatly encouraged by a confined over-moist atmosphere, which is also very congenial to aphides, which will be sure to make their appearance under such circumstances. As soon as they are perceived, apply tobacco smoke, but if the plants are kept in good health, neither evil will be very troublesome. As soon as frost is likely to occur the glass should be protected every night with straw screens, or some efficient covering; for remember the Cineraria will not stand much frost, and neglect in covering, may do irreparable damage. With respect to potting, the plants should be allowed plenty of root room, until near their period of flowering, and they ought never to be pot-bound during the growing season. Liberal shifts may be given to healthy thriving plants, but weak varieties should not be overpotted. Specimens may have 10-inch pots at the second shift, which will be sufficiently large for the winter, and in March they may be moved into 12 or 15-inch pots, according to the sized specimens desired. The plants should be removed to the front of the greenhouse, or to some light airy situation, where they will be secure from frost and damp. As before stated, keep them free from insects and mildew, and remove any decaying leaves as they appear. When the flower-stems begin to elongate, they should be pegged or tied out, so as to keep the specimens open for the admission of light and air, and manure water will be highly beneficial at this stage. When the plants are in flower they should occupy an airy place, where they will receive abundance of light without being exposed to the full force of the forenoon's sun; but this applies only to plants flowering after the sun becomes powerful in spring. Those blooming in winter like full exposure to the little sunshine and light which can then be afforded them. Where specimens are wished to flower in winter, cuttings should be selected about April, planted in light sandy soil, placed in a temperature of about 55°, and grown as freely as possible during the summer and autumn, and allowed to become pot bound towards November, when, if placed in a temperature of about 50°, they will be found to flower freely, and will be exceedingly useful for furnishing cut flowers. Seeds sown in April produce useful plants for winter flowering, as they grow more vigorously during the summer. When the beauty of the specimens is over, remove the flower stems, unless seed is wanted, and then only a few spikes need be left. Place the plants in a shady situation and keep them clear of insects and properly supplied with water until a supply of suckers is obtained, when the old plants may be thrown away. Good fresh turfy loam, in the proportion of two parts to one of two-years-old cowdung, well intermixed with a quantity of clean sharp sand, according to the nature of the loam, to ensure efficient drainage, forms an excellent compost for the Cineraria. For small plants leaf-soil or sandy peat may be substituted for the cowdung. *A.*

Hollyhocks: *A J.* Propagation by division is best carried out in autumn, immediately after the flowering is over. A large well-ordered plant may sometimes be divided into several, but, in general, three or four is a more advantageous number. Nothing certainly is gained by breaking the old plants into too many pieces; every separate part should carry with it a good share of roots. Seedlings and others that may bloom late cannot be divided till spring. March is, perhaps, the best time, and the fragments, if not broken too finely, will flower during the first autumn.

SEEDLING FLOWERS.

Potentilla: *P J.* A pretty variety, and well worthy of cultivation.

Miscellaneous.

The Symmetry of Vegetation.—The same principles are manifest among flowers. A flower is a body in which that system of equipoise, of which symmetry is the great result, is as clearly traceable as in branches or

leaves, or in the veins of leaves. Either one-half of a flower balances the other, or one series of organs alternates with another, or any deviation from symmetry that occurs in one part is immediately compensated for by some peculiar development specially provided in another part. Take a blossom of the common Goose-foot (Chenopodium). It consists of five slender arms or stamens, which are all exactly alike, and opposite which are five other external parts, forming a star with five rays, the two series corresponding precisely the one with the other. This is one of the simplest of known forms: should a flower be reduced much lower, there is scarcely room for the manifestation of special symmetry. The most complicated structures are merely different in degree. In the Rose, in the Crowfoot, in the Magnolia, or in the Water-Lily itself, the same class of facts pervades the organisation. Among those plants in which augmented number produces a very complex condition is the Vertic-cord. In this flower we have five fringed bodies on the outside of the whole; those bodies consist each of five arms, of which the left and right external arms correspond with each other, and the second inner left corresponds with the second inner right arm; so that we begin with a structure of five parts, each of which is subdivided into five others. In the next place five more parts are placed within and between the first, as if to insure the requisite balance. Then come 10 (twice five) other bodies (scales), which stand, five opposite and five between the second series of five. Finally, we have 10 other parts (twice five again), completing the symmetry of the whole structure, and alternating with the 10 scales which preceded them; the whole presenting a striking example of the way in which, in a complicated structure, the principles of equipoise and symmetry are maintained. Were it possible to weigh the corresponding parts we should, no doubt, find their weights the same, as well as their magnitude and form. The numerical proportions of such a flower are $(5 \times 5) + 5 + (5 \times 2) + (5 \times 2)$. The red Brugmansia offers an instance of a more simple arrangement. In this flower we do not at first perceive any symmetry except that the end of the long tubular corolla is divided into five equal lobes, which, if they had been formed by rule and compass, could not be more exactly alike. On the outside of this corolla, upon each of its five lobes, are three ribs, in all fifteen, or 5×3; and this plant never produces any other number. Upon opening it we find the same number, five, still prevalent in the stamens; and the external cup or calyx is also in reality divided into five triangular teeth, although, owing to the way in which the teeth adhere, this is not at first sight apparent. The fundamental number still being five, this structure is represented by $5 + (5 \times 3) + 5$. All these remarkable examples of floral symmetry seem to show that there is a centrifugal force operating in the formation of flowers, which, being equal in all directions, can scarcely fail to produce such a result. In the ripe fruit of the Apple, no symmetrical arrangement of parts is at first apparent; but it once had a perfectly regular structure, in which all the parts were exactly balanced, and even when ripe its symmetry is visible to the eye of intelligence. At its end will be found five points, which represent the five external divisions that originally belonged to it. If the fruit is cut across, the five-pointed star in the centre indicates the symmetrical number of the Apple to be five. If we count the parts in the Apple blossom, we find five outer divisions in its calyx; five thin delicate plates next succeed as the corolla; then 20 threads for the stamens; and, finally, five other central points or arms complete the structure; all equal and alike in each series, all placed in a certain fixed relation to each other round a common centre, which itself corresponds with the surrounding organs. This structure is $5 + 5 + (5 \times 4) + 5$. In an ear of corn the same kind of symmetry exists, although more difficult to discover. Each grain stands in perfectly symmetrical relation to the others: one right, one left; each a little higher than the preceding. Even the small scales of chaff which enclose the grains are placed in an equally symmetrical position with respect to each other. The demonstration of this, however, involves minute details, which need not be entered upon at present. When properly understood it assists in further proving that symmetry is a fundamental law in plants, and that the most dissimilar forms of vegetation obey that law. *Professor Lindley's Symmetry of Vegetation.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Now that many of the Camellias, Azaleas, and other plants will be removed to their summer situations out of doors—painting or other repairs required by any of the plant houses will be more conveniently done than at any other season. Meantime, however, the weather is rather unfavourable for painting; for, to do this, except when the wood is thoroughly dry, is a very inconvenient and troublesome way of wasting money; but other necessary repairs may be done, so as to allow of proceeding with painting whenever the weather will admit, without the hindrance of having other work to execute first. Where houses are painted sufficiently often to keep the paint always good, which is the cheapest method in the end, there will be no difficulty in getting the wood dry, but where the wood is allowed to become nearly bare before repainting is thought of, the house should be kept dry inside, covering the outside with a tar cloth, in the case of showers, and allowing a fortnight of bright warm weather to thoroughly dry the wood before the work is commenced. It is oftentimes very inconvenient to attend to this, but if the work is to stand, it must be done at whatever inconvenience. STOVE.—If there are sickly or badly rooted specimens here they must be frequently examined for red spider, otherwise they will become a nursery for this pest, from which it will soon spread to adjoining plants. Also guard against the increase of mealy bug, and keep black thrips and green-fly in check by timely applications of tobacco smoke. See that young growing stock is not allowed to suffer for want of pot room, and attend carefully to the watering, giving manure-water to all plants in free growth that enjoy it. Gardenias, &c., which have been removed to the conservatory while in bloom, should be replaced in heat as soon as their beauty is over, in order to allow of getting their growth matured before the dull cloudy days of November. Give every attention to plants for winter blooming, affording them a moist warm temperature, and using every care to prevent their sustaining any check at the present season. ORCHIDS.—The growing stock will require the assistance of a little artificial heat while the weather continues wet and cloudy, if only to allow of admitting fresh air and preventing damp, &c. Shading must be promptly attended to when bright sunshine occurs, as the foliage is unusually tender in consequence of the long period of gloomy weather which we have experienced. Allow them, however, as much light as they will bear without injury, using a very light screen, and only when absolutely necessary. Keep the foliage clear of insects and dust, by frequent syringings or spongings, as may be necessary.

FORCING DEPARTMENT.

PINERY.—Plants expected to show fruit at once, if backward in doing so, should, provided the growth has been well matured and checked by having been kept dry for a time, have a good soaking of water, and be kept warm and moist. This treatment will induce an active root action, and we have seldom found it to fail in inducing backward plants to show fruit, but everything depends upon the growth having been well matured and checked. Avoid syringing plants over head that are in bloom, except on the mornings of bright days, unless sufficient fire-heat is used to keep the atmosphere in motion at night, and prevent injury from damp; for a too free use of the syringe when the weather is dull and cloudy is apt to cause the fruit to be deformed. Young growing stock will be making very rapid progress in the present state of the weather, and some attention will be necessary to secure strong stocky growth, without which first-rate fruit cannot be expected. See that the plants have sufficient space for the development of their foliage, and do not keep the atmosphere so warm as to induce weakly growth. The watering of Pines is frequently left to inexperienced persons, who would not be trusted to water a hardwooded plant of any consequence, and hence they are more commonly over or underwatered than any other plant of equal importance. But although of very easy culture, these plants are not insensible to bad treatment, and are very speedily injured by overwatering. Water should never be given without first ascertaining that the soil is dry, and then a thorough soaking should be afforded, using manure water for plants that are well rooted.

FLOWER GARDEN AND SHRUBBERIES.

In some localities, Verbena Defiance, Calceolarias, and other bedding plants are getting seriously infested with green-fly, and, in some cases, to such an extent that, unless effective measures are adopted for clearing the plants of this pest, there is little hope that they will be of much service this season. We know of no readier or cheaper remedy than moistening the infested plants with tobacco-water and soapsuds of a proper strength, by means of a fine rosed watering pot, and giving them a good washing with clear water from the engine the following morning. This, if properly applied, will clean the plants; but it should be done at once wherever they are suffering, for the season is now far advanced, and if the plants are allowed to get checked, and the present sort of weather continues, there will be but little chance of their ever doing much good. Stir the surface of the soil after heavy rains, wherever it is not covered by the plants, and fill up vacancies from the reserve stock. Keep Roses free from insects, remove dead flowers at least two or three times a week, and get budding finished as soon as possible. Also get Carnations and Picotees layered without loss of time; these are exceedingly useful border flowers, being so much prized for cutting, therefore see that a good stock of them is prepared for next season.

HARDY FRUIT AND KITCHEN GARDEN.

Tomatoes must be regularly attended to, keeping the shoots thin and stopping them above a cluster of fruit; for if the plants are allowed to ramble and grow too freely there will be a poor chance, in an unfavourable season like this, of securing a good crop of fruit. Shallots, if left in the ground after the bulbs are matured, are apt to mildew and rot in wet weather, therefore these should be pulled as soon as the tops begin to decay, and spread out in an airy place to dry before storing them away. Get herbs in flower cut and dried for winter use. Where a sufficient breadth of Celery is not yet planted out, this must be attended to as speedily as possible, and must be well cared for with water, &c., until well established after planting, otherwise good-sized stuff need hardly be expected. Earth up former plantings, and encourage rapid growth by occasional waterings with manure water. See that a good bed of some approved early variety of Cabbage is sown for spring use. Ply the hoe freely among all growing crops, both for the destruction of weeds and for loosening the surface of the soil after heavy rains. Look over all trained fruit trees frequently, for the purpose of stopping and shortening any gross shoots, and keeping the growth nicely regulated; also get the young shoots of wall trees laid in, where not already done.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 20, 1854, as observed at the Horticultural Gardens.

July.	Month's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 25th, 1844—therm. 92 deg.; and the lowest on the 23d, 1843, and 24th, 1838—therm. 40 deg.

Notices to Correspondents.

AUSTRALIA: *An Ishmaelite* should address himself to the secretary of the Royal Geographical Society, Waterloo Place. We do not know.

BLIGHT COMPOSITIONS: *J R.* We cannot insert anonymous communications respecting such a matter. What are called facts must be authenticated by the writer's name and residence.—A report or two in favour of Page's Blight Composition have reached us from persons unknown to us, but we wish to ask the gardeners with whom we are acquainted, and who have used it, what their opinion is respecting its quality.

BOOKS: *H S L.* Mrs. Loudon's "Every Lady her own Gardener," and Paxton's "Cottagers' Calendar," will possibly answer your purpose.‡—*J C.* Will you be so good as to point out where we said that Macculloch's book on Wine-making cost only 2s.? We dare say there is no more recent edition than what you have. But what then? We understood you to ask for the *best*, not the newest work on the subject, and we adhere to our recommendation.

CONIFER SEEDS: *J P E.* Sow them now in shallow pans in yellow loam, and keep them in a cold frame. When large enough pot them off, but take care not to allow them to remain in pots till the roots get cramped for want of room.‡

CUCUMBERS: *Julius.* A very fine fruit, measuring 21 inches in length and 9 inches in circumference. Flesh crisp, juicy, and well flavoured.‡

DISEASES: *Old Sub.* The leaves of Lychnis coronata transmitted by you exhibit nothing which can be considered as likely to produce the yellow spot. There are living aphides still upon the plant, and some portions are thickly covered with Microsporium Cheiranthi, but neither the animal nor vegetable parasite can be regarded as the cause of disease. The temperature for months has been several degrees below the average, and there has been scarcely a sunbeam—circumstances which are quite enough to account for morbid appearances. Where the most contagious diseases amongst men are prevalent, it is not every one who is a victim; and, on the same principle, some of your plants may remain healthy, while others suffer. Propagate from the healthy stock, for it is very possible that the diseased state of the other plants may be permanent. *M.J.B.*

DROPMORE: *W C.* The gardens at Dropmore are permitted to be shown, we believe, every day, except Sunday, to all persons of respectability. Maidenhead is the nearest station to them.‡

INSECTS: *J S.* The chaffers are the common little English dung beetle (Aphodius fimetarius). The black flies are parasites in the egg cases of the cock-roach. Its history will form the subject of a separate article. *W.*

HEATING: *A B.* We *cannot* make out what it is that you want to know. Surely you do not inquire whether such a flue will draw? Of course it will.

LARCH BLIGHT: *W G.* There is no practicable means of destroying this. The Horticultural Society would be glad to receive the plant you mention.

MIGNONETTE: *L.* Damp at the root is the only cause we can assign for your Mignonette dying off in the way you describe. If that be so, and the plants are too thick, they should be thinned out a little, so as to permit the superabundant moisture to escape from the surface of the bed.‡

NAMES OF PLANTS: *J S W.* Certainly not Ceropegia stapeliæformis; it is possibly a morsel of Boucerosia umbellata.—*J M A.* Aerides quinquevulnerum.—*Sancho.* Velleya lyrata, Veronica pinnata, Veronica maritima, and Linaria purpurea.—*E I P.* Valeriana officinalis.—*G P L* Mimulus luteus, a native of Chili.—*F B.* It appears to be Cereus crenatus; but plants of that kind cannot be determined with certainty by the flowers alone.

PEAS: *F L A D.* Next week.

PEACHES: *J Mc, Renfrewshire.* Our opinion is that the Peaches you sent are all one sort, the Royal George. None of the six received were the Noblesse. The latter has large flowers; the Royal George has small. The flesh of the latter is red at the stone; that of the Noblesse is pale, and its skin is not distinctly dotted with red towards the shaded side, as is the case with those you forwarded. We conclude the judges were right, although at the same time we admit that it is very difficult in many cases to distinguish varieties of Peaches by the fruit only. By observing the nature of the flowers and leaves, the different varieties in cultivation can be determined with certainty.‖

RAGGED JACK: *Hull.* It is a variety of Borecole, which is quite as hardy as the green curled kind, and should be treated exactly like it. If you cut the heads off your plants that are seeding they will not supply sprouts fit for use this winter if you have young plants, it is not too late to make a fresh plantation now.‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

TURNIP SOWING.

SUPERPHOSPHATE OF LIME, made from Bone, which is the best Manure for Root Crops (see the Royal Agricultural Society's Journal, Vol. vi., part 2). PERUVIAN GUANO, NITRATE OF SODA, BONE DUST, SULPHURIC ACID, and all other Manures of known value. The PEAT Moss CHARCOAL COMPANY have appointed the undersigned Sole Agents for the Sale of this fixer and distributor of Ammoniacal matter. They are also Sole Agents (in London) of the Patent Sanitary Company for the sale of their "Nitrogenised Carbon."—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BALANCE OF FACTS IN FAVOUR OF RICHMOND AND CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL.
"Early Court, Reading.
"GENTLEMEN,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover a very superior finished Machine, and a pattern for other makers. (Signed) "GEO. SHACKELL.
"Messrs. RICHMOND & Co."
Address—RICHMOND & CHANDLER, Manchester; and South John Street, Liverpool.

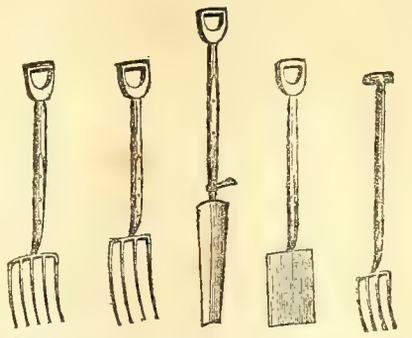
M'CORMICK'S PATENT REAPING AND MOWING MACHINE.
☞ CAUTION TO USERS, PURCHASERS, AND MANUFACTURERS!
Parties are hereby cautioned against "Making, Using, Exercising, or Vending," any Reaping Machines which infringe on M'Cormick's Patent without a licence from him, *as proceedings at law will be instituted against all such as infringe.* The main features of M'Cormick's Machine consist in zig-zag serrated cutting blade, spear-head shaped holding fingers, and gathering reel.
The sale of these Machines, in the United States, for the present harvest, has been upwards of 1500, their efficiency and superiority being established by the use of thousands for several years.
Machines containing all the *patented improvements* adapting them to the cutting of *grain* or *Grass*, and guaranteed to perform well, may be had on application to Mr. M'CORMICK'S Agent, D. C. M'KENZIE, 166, Fleet Street, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain who on application will forward wholesale and retail prices.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

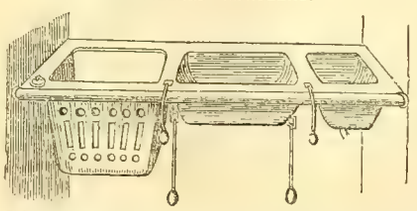


MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHE will last out three of the ordinary sort, and is always ready for use.
"We have seen this Scythe at work, and can strongly recommend it."—See *Mark Lane Express*, May 16, 1853.
To be had of every Ironmonger and Nurseryman in the kingdom; and wholesale and retail of WM. DRAY AND CO., Agricultural Implement Makers, Swan Lane, London.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



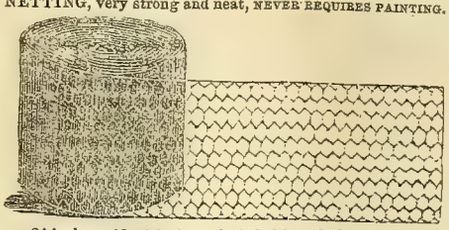
THESE FITTINGS have all the newest improvements and are the only patented invention of this description. Also Improved Stable Fittings with Rack, Manger, and Water Trough attached, New Pattern Manger and Water Trough combined; Corner and Straight Mangers, Plain, Enamelled, and Galvanised; Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONFOUNDER, SMITH, &c., 370, Oxford Street, a few doors east of the Pantheon.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.

This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening Pursuits, are invited to examine DEANE, DRAY, AND CO.'s extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

Averuncators	Garden Scrapers	Pickaxes
Axes	Gidney's Prussian Hoe [Scissors	Potato Forks

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also wholesale and retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.
DEANE, DRAY AND CO. (Opening to the Monument), London Bridge. ESTABLISHED A.D. 1700.

REAPING MACHINE COMPETITION AT STIRLING.

THE STIRLING GENERAL AGRICULTURAL ASSOCIATION hereby offer the following PREMIUMS to be competed for during next harvest:—
1st, For the most approved Reaping machine, of any price, £20.
2d, For the most approved Machine, not above 25 gs. in price, £20.
Should the judges fix on a machine of 25 guineas, or under, to be the best on the field, it will thereby be entitled to both prizes.
The price and simplicity of construction of all the machines will be taken into consideration in awarding the Premiums, but the Society reserves the power of withholding the Premiums if, in the opinion of the judges, the machines are not of sufficient merit.
Intending competitors will require to enter with Mr. Hutton, their Secretary, at Stirling, not later than the 9th August, when they will have due notice of the time and place of competition forwarded to them.
Intending competitors must forward with their notice of entry the sum of 2*l.* sterling, to be returned on the morning of trial to those who appear on the field of competition with their machines.
The machines are to be tried on all kinds of crop, and upon both Dryfield and Kerse Lands, if required. The trials to be continued until the Judges and Committee appointed by the Association are satisfied.
Machine-makers entering machines are to state what price they will furnish such machines as they compete with to members of the Association, and farmers entering are to state the price they paid for those they compete with. By order of the committee. WM. HUTTON, } Joint
Stirling, July 5, 1854. WM. FORRESTER, } Secs.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S, F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILEY, Cirencester. Price 1*s.*

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION (especially with regard to AGRICULTURE), Wickham Market, Suffolk, conducted by Mr. G. DOWNES.
At this establishment a sound and liberal education may be acquired on moderate and inclusive terms.
Soils, Minerals, and Manures carefully Analysed.

THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will take place on TUESDAY and WEDNESDAY, the 21st and 22d days of November, 1854. Prize Lists, &c., to be had of T. PAIN, Hon. Sec.—Salisbury, July 22.

The Agricultural Gazette.

SATURDAY, JULY 22, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, July	26	Agricultural Society of England—Mr. Mechi's Annual Gathering.
THURSDAY, —	27	Agricultural Imp. Society of Ireland.
TUESDAY, August	1	Meeting of the Highland Agricultural Society at Berwick.
WEDNESDAY, —	2	
THURSDAY, —	3	

WE make no apology for filling our columns this week with a report of the exhibition of implements, cattle, horses, sheep, pigs, and poultry, held during the past week at Lincoln, under the auspices of the Royal Agricultural Society. It may be safely pronounced one of the most successful gatherings of the kind that has ever been held in this country.

The high agricultural character of the locality

has attracted large numbers from a distance, and the splendid weather has, we should suppose, swept the whole of the county into its chief town. Lincolnshire has itself contributed, in no small degree, to the merits of the exhibition—nearly one-third of all the shorthorns shown are shown by Lincolnshire breeders—and some of the best of the implement makers are Lincolnshire men. And we must not forget that in Lincolnshire itself is an attraction which, more perhaps than any other consideration, has induced the visits of agriculturists from the more distant parts of the country.

Home Correspondence.

Salting in Damp Hay and Grass.—Damp hay, or even Grass, may be stacked with layers of straw, or of old hay, sprinkled with salt to prevent heating, and to draw out the juice from the damp Grass, which is then absorbed by the straw. Mouldy hay, put together with salt, from 8 lbs. to 25 lbs. per ton, was better relished by the cattle, and did them more good, than sound hay stacked without salt, of which many instances are recorded (Johnson on Salt, p. 105, &c.) An excellent farmer, at Landrake in Cornwall, many years ago, stacked damp hay with salt, which came out almost a paste when the rick was opened, but the cattle devoured it greedily. In Germany, they even cure fresh cut Grass by pitting with salt, 1 lb. to the cwt.; it comes out quite a paste, and is said to go farther in food than the same quantity of Grass made into hay. The advantage of dry straw, to absorb the juice drawn out by the salt, is twofold; first, in preventing the souring of the Grass; and second, in rendering the straw itself nourishing and palatable, by the juice thus absorbed. The proportion of straw may vary from one-eighth to one-fourth, and the salt from 1 lb. to 3 lbs. per cwt., according to the dampness of the new hay. If old dry hay is used instead of straw, it must be in larger proportion, because less absorbent. And where neither can be had, chaff or young Furze might do; or even bran, if salted enough to prevent fermentation. *J. Prideaux.*

Waste Lime of the Gas Works.—A question has been put to the writer concerning the best method of applying this offensive compound, sulphuret of lime, as a meliorator of the ground, for the purposes of agriculture. Some local difficulties attend this, and the question, in all its bearings, requires much consideration. In the first place, it would never do to lay a stratum of the gas-lime upon the surface of any land; and were its foul odour out of the question, there are light and sandy soils which might be seriously deteriorated by so powerful a chemical agent. Strong clay lands, like those around Sydenham, and in many parts of Norwood, would be much improved in texture and temperament by it, but judgment would be required. The gentleman who made the inquiry is extensively engaged in the manufacture of gas, and while in conversation with him it occurred to the writer that if shallow oblong excavations were made in appropriate land—say 2 feet deep, and of suitable length and breadth, so as to receive the lime, as removed, and to allow its being effectually covered at once with the earth thrown from the space—the object proposed would be brought into a state of progress; for, first, the liquids would pass into the loosened earth, become absorbed, and to some extent chemically fixed; secondly, the offensive odour would be entirely kept down by the covering of earth; and, finally (allowing due time for those changes which nature would operate), by thoroughly blending the lime with its superstratum of covering earth, a compost would be produced which might be spread over the land, previously to ploughing in the autumn. The foregoing hints are suggestions only, and as such admit of modifications in every way: the question is mainly one of labour until it be tested by practice. *Croydon.*

Wheat.—Within the last 48 hours complaints are general in this neighbourhood of the blighted state of the Wheat crop. I inclose specimens of the average state of whole fields of Talavera and Chidham, which, until lately, promised a most bountiful yield. Some three weeks back red rust attacked the leaf of the plant; had fine weather ensued this might have been overcome; but the atmosphere being favourable to the growth of this parasite, it has now attacked the corn itself. How far its ravages may extend it is impossible to calculate, as there appears to be no remedy known to man to meet this disease—fine sunny weather being the all-in-all. I am also sorry to note the usual symptoms of the approaching Potato disease; this is to be regretted, as the crop, perhaps, never looked better. On this farm, last season, early in July, I had Turnip seeds sown over the Potato land; they had one hoeing, and the few disturbed in lifting the Potatoes were replanted. This made full amends for the deficiency of the Potato crop, and proved excellent feed for couples in the spring—now succeeded by a fine crop of Barley. The loss from disease in the Potato crop must be met in some such way, by interlining other things to meet expenses. *H. Bowers, Busbridge Farm, Godalming, July* 11. [See a paragraph in Notices to Correspondents.]

Pigs Killed by Eating Monk's-hood.—A neighbour always lost his pigs when away from home; at last they were opened, and the Monk's-hood found in them, the fact being that his gardener always cleared up his garden in his absence, and his pigs had access to the heap of rubbish. The persons who opened the pigs were both unwell for some hours after having handled the chewed Aconite. This gentleman had lost 40*l.* worth of pigs before he found out the cause of their death. *S.*

Societies.

LINCOLN MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Lincoln, *July* 19.—The visitor of the English Agricultural Society's annual meeting will this year have passed through greater abundance and promise of food than on any previous occasion. He enters a county which agriculturally owes more to art than any other county in the kingdom. If he comes from the north he passes through the Wold country, which has owed so much to the tenant-right system prevalent on the Brocklesby estates; if from the south he has traversed the low fen and marsh lands around Peterborough and Spalding, which have been reclaimed from the dominion of both salt water and fresh, and from utter waste and desolation made the most productive land in the kingdom. In the centre of the shire he crosses Lincoln Heath—once a wilderness, now a succession of fertile fields—once needing the land light-house for the guidance of the traveller, to whom its only use at present is the strange light it throws on the agricultural condition of the district in the past. Of this, however, we have specific evidence in Mr. Young's report of half a century ago, where he says:—

"The vast benefit of enclosing can, upon inferior soils, be rarely seen in a more advantageous light than upon Lincoln heath. I found a large range which formerly was covered with Heath, Gorse, &c, and yielding in fact little or no produce, converted by enclosure to profitable arable farms, let on an average at 10*s.* an acre, and a very extensive country all studded with new farm-houses, barns, offices, and every appearance of thriving industry; nor is the extent small, for these heaths extend near 70 miles, and the progress is so great in 20 years that very little remains to do. The effect of these enclosures has been very great; for while rents have risen on the heath from nothing in most instances, and next to nothing in the rest, to 8*s.* or 10*s.* an acre, the farmers are in much better circumstances, a great produce is created, cattle and sheep increased, and the poor employed."

On this Mr. Pusey adds:—

"This is indeed a bright picture of wide and rapid improvement drawn at the close of the last century; and Mr. Young might well say that little remained to do. But has nothing been done? Under another head of his report—'Amount of Crops,' I find the following entry:—'In the enclosures from the heath—crop of Barley, three quarters; oats, four; no wheat.' And in my own note-book, taken on the same heath in the present year;—barley, six quarters; oats, none—since they are too poor a grain for such farms; wheat, four quarters, sometimes five,'—a warning that in farming, as in other pursuits, we should not say 'very little remains to do.'"

Mr. Pusey's report, drawn up 10 years ago, is already, no doubt, below the truth of the present day, but the reader who wishes to learn how agricultural enterprise has conducted itself in Lincolnshire, may still usefully refer to it in the 4th volume of the Society's Journal.

The Trials of Implements commenced on Thursday last, and will continue till this evening. They are arranged in various classes. Steam engines and threshing machines being placed under one examination, chaff cutters, Linseed crushers, churns, &c., under another, drilling machines under a third, and ploughs, hoes, harrows, reaping machines under a fourth. The weather for the last class has until this day been exceedingly unsuitable, Saturday and Monday having both been wet. On Saturday, Messrs. Ransome, Howard, Busby, and others attempted to turn over some stiff clay soil 11 inches deep, and with the assistance of eight horses to a plough the thing was done, and in sufficient quantity to enable the judges to arrive at a decision on the merits of the implements; though it must be admitted that an opinion formed under such circumstances can be of but little value. Howard's and Ransome's were the only implements able to do the work efficiently; the prize was given to the former. After the deep ploughing, 8 or 10 ploughs were set to turn a furrow 5 inches by 9, and several of them did their work very well indeed—Ball, Busby, Ransome, Howard, and Cooke, may be specified.

These and other ploughs were pitted against one another on lighter soil on the afternoon of Saturday, and the morning of Monday, and some very excellent work was exhibited.

Successive trials had resulted by Monday in weeding these "general purpose" ploughs, as they are called, down to two, Ransome's and Howard's; and they were tried against one another, the latter being held by apparently a better ploughman than the former; however, it was the business of the judges to say which was the best plough, not which was the best ploughman, and for this purpose the dynamometer was applied, and the prize was awarded to Ransome's. It may be safely said that the implements are of equal merit, or at any rate, that any differences that may exist are not such as the short trials to which they have been subjected here are capable of discovering. While these examinations were in progress, the other judges were engaged in inspecting and working the drills in a neighbouring field. Their performances are less open to the inspection of a number, and until the grounds of them are published by the judges themselves, we shall content ourselves simply with announcing the awards.

On Monday a very interesting trial of reaping machines took place on Rye, which was in a tolerably fit state for the operation; and the soil of the field, though somewhat damp and adhesive, was certainly not more so than in most harvest seasons, it occasionally is at reaping time. Crosskill's Bell with M'Cormick's cutters — the same with the old shears, worked by leverage, guided by an oscillating flange on a barrel driven from the carriage wheels —Dray's and Crosskill's Hussey, and Garrett's M'Cormick, with a rotating reel in front, were among the implements at work. A French machine for one horse was also at work, and we shall refer to it in our notice of the implement yard to-morrow. The question of merit lay ultimately between Crosskill's Bell with M'Cormick's cutter, and Dray's Hussey, and the prize ultimately was awarded to the latter. It is singular how the English and Scotch judges vary in their decisions on this subject. In its own country, Bell has uniformly won the palm—and as the trials there have generally been during a fitter state of the corn for its operation, we should be inclined to give greater weight to the Scotch decisions. Dray has this year added a tilting board, which greatly facilitates the delivery of the corn.

Beside these operations in the field, trials have been proceeding of steam engines, barn works, chaff cutters, &c., in the yard. Their results we give in the prize list, which we shall quote below. The kind of test to which the engines were subjected consisted in giving a certain quantity of fuel out and counting the number of revolutions of a given difficulty which each performed. The very great differences which came out must, however, be attributed partly to differences in the stoking and management rather than in the essential character of the engines.

A good deal of discontent has arisen during the past few days in connexion with the so-called public admission to the inspection of these trials in the yards, and that not so much on account of the high charge, as because of the imperfect access given to the operations in progress. The card, too, was not available for a second entrance the same day, which was of course a great deduction from its value.

July 20.—The following awards of the judges of implements were published this morning:—

Kind of Implement	Prize.	Name of Exhibitor.
Plough for general purposes	£5	Ransome & Sims
Plough for ploughing more than 10 in. deep	5	J. & F. Howard
Machine for making draining tiles or pipes for agricultural purposes	5	Thomas Scragg
Cultivator, grubber, and scarifier	5	E. H. Bentall
Drill for general purposes	10	R. Hornsby & Son
Corn and seed drill	10	R. Hornsby & Son
Most economical corn drill for small occupations	5	J. Smyth & Son
Most economical small-occupation seed and manure drill for flat or ridged work ...	5	R. Garrett & Son
Turnip drill on the flat, with manure ..	5	R. Hornsby & Son
Turnip drill on the ridge, with manure ...	5	R. Hornsby & Son
Liquid manure or water drill	5	Hugh Carson
Manure distributor	10	T. Chambers, jun.
Horse hoe on the flat	5	R. Garrett & Son
Horse hoe for setting out or thinning Turnips	5	R. Garrett & Son
Reaping machine	20	Wm. Dray & Co.
Portable steam-engine, not exceeding 8-horse power, applicable to threshing or other agricultural purposes	20	Hornsby & Son
Second best do. do.	10	Ransome & Sims
Fixed steam-engine, not exceeding 10-horse power, applicable to threshing or other agricultural purposes	20	Ransome & Sims
Second best do.	10	Wm. Dray & Co.
Portable threshing machine, not exceeding 6-horse power, for larger occupations ..	10	R. Hornsby & Son
Best portable threshing machine, not exceeding 8-horse power, with shaker, riddle, and winnower, that will best prepare the corn for the finishing dressing machine; to be driven by steam ...	20	[worth & Co. Clayton, Shuttle-
Fixed threshing machine, not exceeding 8-horse power, with shaker, riddle, and winnower, that will best prepare the corn for market: to be driven by steam	20	[worth, & Co. Clayton, Shuttle-
Corn-dressing machine	5	—
Grinding mill for breaking agricultural produce into meal	5	[worth, & Co. Clayton, Shuttle-
Linseed and corn crusher	5	—
Chaff cutter, to be worked by horse or steam power	5	—
Chaff cutter, to be worked by hand power	3	James Cornes
Turnip cutter	3	Bern. Samuelson
Machine to reduce roots to a pulp	3	Fred. Phillips
Oil-cake breaker for every variety of cake	5	—
Bone mill, to be worked by steam or other power	5	—
Churn	3	—

Special Prize offered by R. A. Slaney, Esq.

For the best plough to fill in the soil cast out of drains, with not more than four horses, two and two abreast, 10*l.*—Not sufficient merit.

MISCELLANEOUS.

Kind of Implement.	Award.	Name of Exhibitor.
For a useful farmer's cart	Medal.	William Busby
Do. do.	Do.	Thomas Milford
A cottage stove and cooking apparatus	Do.	W. N. Nicholson
A useful and economic drainage level	Do.	H. A. Thompson
One-horse cart	Do.	Wm. Crosskill
For corrugated piping	Do.	Burgess & Key
Improved mode of screening clay, with a high commendation of his tile machines	Do.	John Whitehead Fowler & Fry
Patent steam draining plough ...	Do.	

Specially Commended.—For Combined Threshing Machine, exhibited by E. & T. Humphries.

The Following Articles were Highly Commended.—Drill for General Purposes, exhibited by Richard Garrett & Son; Corn and Seed Drill, Richard Garrett & Son; Turnip Drill on the Ridge with Manure, Richard Garrett & Son; for the Plough adapted for Ploughing more than 10 inches deep, Ransome & Sims; for the Plough adapted for general purposes, J. & F. Howard; Hand Chaff Cutter, Barrett, Exall, & Andrews; Ditto

Ransome & Sims; an Useful Application of Tubular Iron to Agricultural Purposes, W. N. Nicholson; Stoves for Cottage Bed Rooms, W. N. Nicholson; Improved Patent Horse Rake, J. & F. Howard; Improved Horse Drag Rake, Ransome & Sims; Bruce's Patent Stable Fittings, Ransome & Sims; Haymaker, Smith & Ashby; for a useful Plank-sided Cart, John Cook; for Models connected with Drainage, J. Bailey Denton; for his Improved Cauldron for preparing Asphalte, John Woods; for a useful 3-ton Cart, and Cattle Weighing Machines, Richard Forshaw & Co.; Farm and Village Fire Engine, Richard Forshaw & Co.

THE FOLLOWING ARTICLES WERE COMMENDED.—Horse Hoe for setting out and thinning Turnips, exhibited by Richard Garrett & Son; Reaping Machine, William Croskill; Subsoil Plough, William Smith; Hand Chaff Cutter, Dray & Co.; Ditto, Garrett & Co.; Improved Cart Saddle, James Dunlop; Seed and Corn Separator, John Gillam; Useful One-horse Cart, John Barker; Iron Gates, Barnard & Bishop; Farm and Village Fire Engine, Dray & Co.; Useful Stable Furnishings, Mapplebeck & Lowe; Improvement in Scythe Plates, Mapplebeck & Lowe; Corn and Seed Drill, William Walker; Combined Threshing Machine, R. Garrett & Sons; Plough for general purposes, William Busby; ditto, William Ball; ditto, Burgess & Key; Screw Jack, John Eaton; Cultivator, Grubber, and Scarifier, R. Coleman; ditto, William Crosskill; ditto, Charles Hart.

B. T. BRANDRETH GIBBS, *Hon. Director of the Show.*

The Implement Yard was opened early this morning. It is needless to attempt the description, or even the formation of a judgment, of implements whose relative merits have been arrived at only after many days' careful trial and investigation, by as many as twelve judges. We shall, therefore, just refer to a few of the most notable machines, as we pass around the yard, premising that while the Show seems somewhat less numerous, it appears altogether more substantial and useful than any that the Society has yet held.

Messrs. Crosskill exhibit their clod crushers, Uley cultivators, carts, and waggons, &c. Nos. 8 & 9 at their stand are two different forms of Bell's reaping machine; the former being the original one, with clipping apparatus, the latter having M'Cormick's serrated cutters. The effect of the last alteration is to make the machine work with considerably less power, and the serrated cutters are lighter, and less liable to get out of order than the shears. They are also less expensive, and notwithstanding the enormous rise in the value of wood, iron, and labour since last year, the improved machine can be supplied at the same price as the old one, including a complete set of cutters extra; so that, in case of accident in the harvest field, one set can be repaired without the machine having to be stopped. The alteration in the frame, and the mode of attaching the driving wheels by catches and springs, makes the reaper much more manageable in the field, and it can be backed or turned without the necessity of throwing the wheels out of gear. This machine cut a width of 6 feet 6 inches, and is said to cut 15 acres in 10 hours, assuming that the horses travel 2½ miles per hour. Price of the reaper, including two complete knife bars and six spare cutters, 42*l*. This machine made very good work on the trial ground; the decision given over it in favour of Dray & Co.'s Hussey's machine is chiefly on the ground of greater cheapness, both of first cost and of labour. Twelve hours of Bell's reaper would, it was said, require eight horses, whereas four would suffice for Hussey's. Add to this the greater compactness and general manageability of the latter; and while we contend for the superiority of the principles involved in Bell's machine, we must admit that those principles have not yet been developed in a sufficiently compendious and manageable form. Mr. Crosskill received a medal for his cart.

At the next stand Messrs. M'Neill and Co. exhibit their asphalted felt, with models of roofs and framings, and calculations of cost relatively with that of slate.

Mr. Dunlop, of Haddington, exhibits, we think, the only lot of farm harness in the yard.

Messrs. Gibson, of Newcastle, exhibit their revolving cultivator, which appears to be simply a modification of Samuelson's digger, containing a greater number of teeth in each disc, and a greater number of discs slung on the axle. The Northumberland clod crusher is also exhibited at this stand. It consists of a number of wheels on two parallel axles, working those of the one axle within those on the other, so as to mutually clear one another.

Holmes and Co., of Norwich, exhibit threshing machines, steam engines, and drilling machines. Their combined threshing, shaking, and winnowing machine is a very efficient implement. The shaker is formed of four boxes, having perforated plates on the top surface, and the bottom boarded, so that all the corn remaining in the straw is thoroughly shaken out, and it passes through the perforated plates into the boxes, and is delivered from them to the riddle. By this arrangement the crank bearings under the shakers are kept clear from dust, and are much more convenient to oil. The riddle and trough are made in separate divisions, worked by a double-cranked shaft, by which the motion is rendered more even and smooth than by a single crank, and is more durable. In this machine, as in most of the other travelling machines, the corn is delivered into sacks at one end, in nearly a fit state for market, and the straw at the other; the chaff on one side, and the colver or cuttings on the side opposite, thereby making a perfect separation of the whole; and it has the advantage of blowing the chaff and dust in an opposite direction to the motive power or steam engine, which may be considered so far an advantage, as the dust materially injures the working parts of an engine. The whole of the working parts are fitted with coupling brasses, and great attention has also been given to have the straps working several parts of the machine pulling in opposite directions to each other from the main drum-shaft, thereby counteracting each other in such a way as to greatly lessen the friction in any one direction of the drum-shaft or brasses, and consequently add very much to the durability of the machine in this respect. Price 95*l*.

Mr. Samuelson, of Banbury, receives a prize at the next stand, for his well-known Gardener's Turnip cutter, which has been lately improved by the substitution of a grating in front for the solid board, so as to allow of the passage of dirt. The forking machine made by Mr. Samuelson is also exhibited, and has been tried. It is reduced in width, so as to be more manageable; but the less appearance of work left behind it makes against it in the off-hand judgment of spectators—which judgment in this case, however, is sanctioned by the silence of the judges on the subject.

Among the implements exhibited at stand 16 is the liquid manure drill invented by Mr. Chandler, of Aldborne, Wilts. In place of delivering by cups, the liquid now finds its way out through pierced plates over exit pipes, on the same principle as Spooner's which competes with it: the whole is kept clean and well mixed together by stirrers. This implement will drill three or four rows of any kind of thick liquid manure from cattle-sheds, piggeries, &c., or water mixed with all kinds of artificial manure, in any quantity from 2 to 15 hogsheads per acre, either with Mangolds, Turnips, or Carrots, &c., at any distance, or spreading liquid manure broadcast. The recent improvements are—the cistern is divided into compartments, to suit side-hill land; and the buckets are fixed with bolts and screws to a cylinder instead of chains, consequently avoiding the wear and tear of cups and chains. Price 27*l*. 10*s*.

At stand 18 Mr. Whitehead, of Preston, exhibits a tile machine, which is highly commended by the judges here, and has received prizes elsewhere. Near this is an ingenious reaping machine by a gentleman, Mons. Mazier, from L'Aigle (Orne), France. It is on the principle of M'Cormick's cutter, for working by one horse, and can work to and fro on one edge of the standing crop by means of a turnwrest arrangement by which the cutting apparatus is shifted from side to side of the framework. The velocity is got up by a toothed wheel working into an endless screw, which is of course mechanically bad, being wasteful of power. It is an exceedingly ingenious and well made piece of apparatus, and attracted a great deal of attention in the trial field.

Messrs. Garrett exhibit at stand 21 a large number of drills and horse-hoes, the latter prize takers as usual. Their three-row manure and Turnip drill also received a prize. This is a cheap and efficient drill for the purpose of drilling, in rows, on either flat or ridge-ploughed lands, Turnip and Mangold Wurzel seed, with Rape-cake dust, guano, Irish peat charcoal, or any light pulverised manure. The manure-coulters are fixed to a swing bar; while those for seed are attached to levers, to admit of the manure being buried any depth in the soil, and the seed to be deposited directly over it with a portion of mould between them; for which forks are provided. It is calculated for two rows from 20 inches to 28 inches apart, and three rows at 16 inches apart, and the quantities may be delivered as required —say for Turnips 1 lb. to 6 lbs. per acre; Beet seed, 3 lbs. to 8 lbs. per acre; and the manure may be regulated as required from 2 to 16 bushels per acre. This drill is adapted for the draught of one horse or pony, and will be found most convenient and easy of management. Price 14*l*.; if made to drill three rows of Beans, without manure, 1*l*. 10*s*. extra; if made to act as a horse-hoe, 2*l*. 8*s*. extra.

At this stand were two very ingenious machines for cutting Turnip rows into bunches. One does it by means of revolving choppers, the other by a revolving circular edge. In the latter a circular edge across the row is made to revolve; it is plain that thus the whole row would be as it were sawn out and off as the machine progressed; but the circular edge is broken in three or four places, and so three or four times in the length of row covered by the progress of the machine during one revolution of the circle, there are three or four bunches left untouched. The fore steerage to the drills exhibited by Messrs. Garrett has been improved by a double leverage which gives the steerer very great power over the motion of the implement, so as to control any tendency to deviation from the straight line with perfect safety and effect. Messrs. Garrett exhibit fixed barn works on the ground.

Clayton, Shuttleworth, & Co. of Lincoln, also exhibit an arrangement of fixed barn works, and at their stand a large number of portable threshing machines, steam engines, and saw machines, were stationed. We had the pleasure of going over Messrs. Clayton's works, in Lincoln — one of the best exhibitions certainly of which the city can boast; 600 men are employed, and one steam engine on an average is turned out every day, and four threshing machines a week. They have received the prizes for the best portable and the best fixed threshing machines. The latter was exhibited at the Royal Agricultural Society's meeting held at Lewes, 1852, and had a prize of 20*l*. awarded to it. Since then it has had several important improvements and additions made to it. Elevators for discharging the grain into sacks and a Barley-awner have been added; both of which are found to be very valuable and efficient appendages, and effect a considerable saving in labour. It also effectually separates the chaff from the pulse or cavings. The chaff, too, can be brought out on either side of the machine at pleasure—a great advantage in out-door threshing, as the weather frequently renders such separation impossible in machines which cannot take out the chaff from either side. It is intended for steam power, and is driven by a strap over a pulley fixed upon the drum spindle. Price 95*l*., subject to 2½ per cent. discount for cash payment after trial; if not fitted with Barley-awner and elevators, 85*l*.

A prize was offered by the Society for the best root pulper. It has been taken by Mr. Philips, of Bristol, for a machine which consists essentially of a number of rotating circular saws in front of which the roots are pressed, and before which they are made to oscillate by means of a to and fro motion of the surface on which they rest. It reduces the roots hardly to pulp, but certainly to sawdust. It costs 11*l*.

The so-called pulping machines of Messrs. Bushe & Barter, of Glancairn, and the conical grating machine of Mr. Moody, of Maiden Bradley, Wilts, both of which have been described in this Journal, were exhibited by Mr. Simpson, of Lincoln, at stand 56.

Messrs. Hornsby exhibit at stand No. 38: they have been very successful in their competition for drills, and very neat and clever many of them are. They have also carried off the prize for locomotive steam engines. We select for notice their dibbling machine intended for hill-side sowing. The seed-box is supported in the centre, and by means of a screw at one end, can be raised or lowered endways as the drill travels, so that the box is kept quite level when the drill is travelling on the side of a hill, at an incline of 1 foot in 6, ensuring as regular a delivery of corn or seed as if travelling on perfectly level ground. It has the patent India-rubber tubes for conducting the seed to the coulters, and also two coulter-bars to equalise the pressure upon each coulter. The great superiority of the exhibitors' patent India-rubber tubes over the usual tins has now been fully proved in their very extensive use for four years. It is obvious that the seed is first delivered by the seed-cups with perfect regularity; and the only possible cause of its reaching the ground irregularly, or in patches, as is so frequently the case, is, the very imperfect delivery afforded by the tins. The mere motion of the drill and the form of the tins cause the seed to rebound from side to side until deposited necessarily at varying intervals in the soil. The adoption of this patent entirely does away with the numerous tin cups working within each other, and substitutes simply the continuous and almost indestructible vulcanised India-rubber tubes, through which the seed passes, protected completely from both wind and rain, even in the most boisterous weather, directly and with unerring regularity into the channels made by the coulters. A new shaker is exhibited in their locomotive threshing machine, consisting of oscillating "slat" riddles, which are said to be more efficient in that particular form of them which is adopted, than the ordinary oscillating riddles of pierced plates.

Mr. Bentall, at stand 40, exhibited his well known broadshare plough. This implement has three shares, preceded by three points, arranged parallelly with each other, the centre point being so much longer than the side ones as to project beyond them in front, while the share connected with it is as much behind the side-shares. This arrangement of the points before the shares is essential, as it is this that enables the implement to penetrate the hardest soils, and gives it a remarkable steadiness in its work, and a capacity of adhering to the land in a degree not to be attained by other means. There are other advantages, too, in this peculiar construction. By means of the long point a share 18 inches wide can often be used in hard ground, when, without it, even a six-inch share could not be used; the chance of weeds slipping by it is thereby greatly diminished, and fewer tines being required, the implement is less liable to choke in foul land.

At stand 45 (Thomas Johnson, Leicester) we noticed a churn of the common barrel shape, the axis of whose motion was placed diagonally through it, so that the contents of the churn would be thrown about much more violently than if it were subjected to merely the ordinary rotation on an axis symmetrically placed.

At stand 46 Messrs. Howard exhibited their well-known ploughs and harrows. They are successful with the deep plough, and second with the general purpose plough.

At Messrs. Smith & Ashby's (Stamford) stand we noticed an ingenious circular tail-board to a cart, which slides in under the body when not in use, and lifts out and in to its place by rotation around the axis to which it is itself part of a cylindrical surface. Near this was a new chaff cutter, thus described by its maker, F. Arding, of the Albert Iron Works, Uxbridge:—This machine, for which her Majesty's letters patent have been granted, is formed by the combination of the concave and the convex knives upon the same fly wheel, and in the same machine. One of the principal objections to the use of the concave or the convex knife separately is, that the knife in cutting thrusts the feed from one side of the mouth to the other, thereby giving the machine a tendency to choke, producing a great amount of friction upon the cheeks or sides of the machine, and causing an unevenness of feed; thus, where the knife enters, the feed becomes light and thin, and where it finishes its cut the feed becomes light and hard. The advantages sought to be established by the use of this machine are evenness of feed, and consequent evenness of cut, and avoidance of friction, by which means a greater amount of work may be done with a given power. It is fitted in the best manner, upon a strong ash frame, with wrought iron stretchers. It has hinged covers to the brass bearings, by which means dust and grit are prevented reaching the bearings. Price 6*l*. 6*s*.

At stand 68, T. Chambers, Colkirk, Fakenham, Norfolk, is the prize manure distributor. It is the most ingenious novelty in the yard. The manure is delivered from a reservoir on to a barrel in the usual way. This barrel is a cylinder of considerable size, and the delivery into the long box with oscillating sides, through which the manure falls to the ground, is over and by means of this cylinder, which acts by means of projecting surfaces of dimensions capable of variation, and kept clean by scrapers acting underneath the cylinder. The following is the entry in the Catalogue:—The principle of this machine consists of a barrel formed of a series of rings, each having moveable projecting pieces (for the delivery of either highly comminuted or rough manure), which come in contact with scrapers, so placed beneath the box that the manure falls directly off, thereby doing away with the certainty of setting fast the joints when the manure has to slide down them; the pressure of the scrapers on the barrel being regulated also by moveable weights to the greatest nicety, according to the adhesiveness of the manure used. It is also fitted with a quite novel and excellent stirrer, of an horizontal movement, by means of a pair of bevil wheels and crank, which never fails to give a constant and regular delivery from the box to the barrel, however moist the contents of the box may be. It will sow from 2 bushels to any quantity required, and is so easily adjusted by the slide, that even when at work the quantity can be varied according to the quality of the soil to nearly the two extremes, which in other machines cannot be done to the same extent without the aid of change wheels; and it has been perfectly successful this spring in the regular distribution of the most difficult mixtures, such as guano, blood manure, salt, &c. Price 15*l.* 15*s.*

At stand 71, Messrs. Fowler and Fry exhibit their patent Steam Draining Plough. This machine is similar in principle to the patent horse draining plough which received the Society's Silver Medal at Exeter in 1850, honourable mention at the Great Exhibition in 1851, and the Society's Silver Medal at Gloucester last year; since when it has undergone important improvements, one of which consists in the use of steam, instead of horse, as the motive power; and the other, the application of some simple machinery by which the level of the drain can be adjusted when the machine is travelling over an uneven surface, and a fall insured with the utmost accuracy without being dependent on the skill of the workmen. The steam engine is one of Clayton and Shuttleworth's; common six-horse engines, having a wrought-iron frame attached to one end, on which two drums are fixed, turned by crane gear off the fly wheel shaft of the engine, which wind up wire ropes attached to the plough in a manner similar to the one worked by horses, shown last year at Gloucester. The engine is fixed in one corner of the field, and the ropes work round an anchor and round the plough, up and down the field.

Dray & Co. exhibit another draining plough, invented by the Earl of Dundonald. This machine cuts the drain and lays the pipe at one operation. The implement is formed something like a mole plough. From the upper surface of the beam there is an orifice, or tube, which is carried in an oblique line through the body of the machine. Through this tube the drain pipes or tiles are dropped one by one, and fall by their own weight into their proper position in the drain which has been cut by the nose of the plough. On trial, the loop by which the draught chain was attached broke before the plough could be induced to move.

Near this stand Mr. Nicholls, of St. John's, Bedford, exhibited his horse hoe, in which the guidance of the machine is effected by altering the *direction* of the wheels and tines, so that they shall themselves follow the path desired, and not by the sheer force of the driver applied to the lifting the whole laterally, as is often the case. Mr. Spooner's water drill is exhibited this year by Messrs. Tasker and Fowle, of Andover. Its advantages are stated to be—1st. The water and manure apparatus being disconnected, admits of the application of almost any amount of water (from one to 32 hogsheads per acre), which can be varied to any extent, whilst the distribution of the manure may remain the same; or, on the other hand, the manure may either be diminished or increased, so that a poor spot may be double dressed, whilst the distribution of the water may continue uniform. 2dly. The manure box is fitted with patent rotary tumblers, which deliver the manure with the greatest accuracy, every row and indeed every plant receiving the same; and is adapted for applying bones, superphosphate of lime, guano, and every kind of concentrated manure, in conjunction with water, or without, as situation and circumstances will allow. 3dly. As the water is discharged on the principle of gravitation, no power is employed in raising it; and the wear and tear of buckets, &c., is dispensed with, whilst the simplicity of its construction secures it from getting quickly out of repair: it is assisted in this respect by the fact that, as the liquid is not impregnated with the acid properties of the manure, the rusting and injury of the metal it comes in contact with is altogether avoided. 4thly. By removing the manure box and coulters, the drill is converted into a water-cart, capable of holding 100 gallons, which will be of great utility at those seasons of the year when not required as a liquid manure and Turnip drill. Price, fitted with improved steerage, 41*l.* 10*s.*; without steerage, 36*l.*

Mr. Brinsmead's patent straw shaker is exhibited near this. This invention produces three effects by one action, namely, first it thoroughly shakes the corn out of the straw; secondly, it collects again the short straw that has dropped underneath with the grain, and sends it away with the long straw; thirdly, it conveys the corn back into the body of the threshing machine. It also facilitates the winnowing process in the combined threshing machine is simple in construction and very easy of power. Price 12*l.* 12*s.*

The series of stands nearly closes with No. 113, that of Messrs. Ransome and Sims. It exhibits a number of ploughs, one of which, the "general purpose" plough, carried off the prize. Scarifiers and grubbers are also exhibited, with steam engines, threshing machines, grinding mills, oilcake breakers, reaping machines, &c. We must refer also to an ingenious machine for scutching Flax exhibited here; and to a Bean cutter invented by Mr. Biddell, the novelty of which consists in the teeth or cutters being made of separate pieces of hardened steel fixed in a cylinder. Each tooth has three prepared cutting edges, so that when one edge, or set of edges becomes dull, they may be taken out, turned one-third round, put in again, and a new edge or set of edges is obtained; and when these fail they may be again taken out and turned one-third round, and it makes a second fresh set; and when this third resource fails, they may be taken out and easily replaced with new teeth, by an ordinary labourer, at a very small cost, viz., 6*s.* If driven at a speed of 150 revolutions per minute, will cut 24 bushels per hour. Price 4*l.* 10*s.*

It would be wrong to close this notice of the implement yard without reference to the very admirable show of seeds, plants, and models of Grasses, grains, and Turnips, Potatoes, Apples, &c., exhibited by Messrs. Lawson, of Edinburgh and London.

Reference should also be made to a revolving liquid manure distributor, exhibited by Mr. Hall, of Romford, which, however, bulky and cumbrous it appears, seems still to be an efficient implement.

We hope to refer shortly again hereafter, to some of the many machines of which no notice can this week be taken.

In the evening the Annual Dinner of the Society was held in the Pavilion adjoining the Show-yard. Mr. Pusey's absence was greatly regretted—his place was supplied by the Earl of Chichester. The toast of the evening, the "Royal Agricultural Society," was given by the Earl of Carlisle, in a speech in which he referred to the plains of Troy as being under cultivation by Garrett's and Crosskill's implements, and to the progress of agriculture in those parts as being likely to furnish the true solution of the "Eastern question."

His Excellency the Peruvian Minister responded to the toast of the "Foreign Ministers," and reference was, of course made, first, in a very pointed manner by the President, and again by himself, to the supply of guano as the agricultural link between the two countries. Lord Harrowby spoke to the question of agriculture, manufacture, and commerce, describing them as sisters whom it was now possible to compliment individually, without any risk of being misunderstood as disparaging the other members of the now happy family. Mr. Thompson, of Early Hall, near York, gave the toast of the "Labourer." The list of awards was read by Mr. Brandreth Gibbs near the close of the meeting. The last toast was to the railway companies, and the application of steam to the interests of agriculture, which during the past week had been proceeding under their auspices, and which gave Mr. Wren Hoskyns, in whose hands the toast had been placed, opportunity to insist upon that more immediate and more important application of it to cultivation to which he has so long and ably directed the attention of farmers. We hope next week to publish a report of his remarks.

July 21.—Magnificent weather leaves nothing to desire as to the success of the Lincoln Meeting of the Society. The cattle-yards had been open yesterday evening at a charge of 10*s.* each person, even to exhibitors themselves, which was, we think, unreasonably hard upon them, seeing that they had presented the attractions to which the sale of any of these tickets was due. The yards were opened this morning at a charge of 2*s.* 6*d.*, and soon became crowded with visitors.

THE SHOW OF CATTLE.

The following are our notes on the show of cattle:—

SHORT-HORNS.—In the class of old bulls, the 1st prize is justly awarded to Mr. Sanday, of Nottingham, for a fine, straight, well proportioned animal, of very good quality of flesh, which we remember a calf by Usurer, in Lord Ducie's herd at Tortworth, 3 years ago.

No. 5, winning the 2d prize, is a white bull, shown by Mr. Booth, and he is also a first-rate animal, of very superior quality. There would have been more difficulty in deciding between these two, had the latter appeared as well as the other when turned out. No. 6 is a red, thick, useful beast—head quarters not quite perfect; shown by Mr. Burtt, of Grantham. No. 8, a dark roan heavy-fleshed animal, of good quality, shown by Mr. Robinson; 9, a heavy well made beast, with very deep chest, drooping slightly in the back; shown by Mr. Dickenson, of Ulverston. The remainder in this class are very useful animals.

Class 2, young bulls, consists of 23 animals, among which are many of very great merit. Mr. Kirkham, of Hagnaby, shows two in this class, by the same bull as the prize bull. No. 27 is a good roan shown by Lord Zetland, with straight back, and very good loins and hind-quarters. No. 31 and 32 deserve notice, as compact, well-made beasts; the latter shown by Mr. Douglas, of East Lothian, is first-rate in his hind-quarters and flesh—not so good in front, and somewhat coarse about the head. No. 35, shown by Mr. Maw, cuts a very poor figure by its neighbours. No. 36, shown by Mr. Odling of Market Rasen, carries off the first prize. He is a remarkably level, well-proportioned beast, of first-rate quality. The second prize was carried off by Mr. Towneley, a very thick, good bull, and the judges must have had some difficulty in deciding the superiority of its rival. It was with reference to this bull, which is, if we remember rightly, faulty in the colour of the muzzle, that the remark of the herdsman applied, "Races are pretty even when won by a neck but here we have been hardly beaten by *a nose*." The prize in bull calves is also carried off by Mr. Towneley, for a roan bull of good form and quality—"Master Butterfly." Amongst others, Mr. Kirkham shows a nice calf by Usurer in this class.

We now come to the class of old cows, consisting of 25 head, amongst which there are a few not very excellent, but the largest number are very superior animals. Eight or ten may be selected of the best we ever saw together. We have never had such a show of cows at any previous meeting. Mr. Towneley figures well here with his cow Beauty by Victor—a roan of remarkably fine touch—somewhat patchy about the rumps, in other respects level and good. Mr. Booth carries off the 2d prize for a fine cow of the same family as Mr. Towneley's first prize animal. "Lady Barrington," shown by Mr. Tanqueray, is remarkable for fine quality of flesh, with however some imperfection, especially in her shoulder, though had she been in condition the determination of the prize animals would have been more difficult. Mr. Stratton shows two useful cows in this class, which are highly commended by the judges. 75, shown by Lord Hill is also justly commended by the judges.

In the young class there is the best show of heifers we ever witnessed. The first prize is taken by Mr. Douglas, of East Lothian: she is a perfect model, and justly merits her position. We believe her even better than Mr. Wilson's celebrated "Brawith Rose," which figured at Exeter, and carried the challenge cup in Ireland, and was shown everywhere, and never beaten. Mr. Towneley comes second with a very good light roan heifer, of uncommon merit, as she needed to be to gain a prize in this class, for they are all magnificent animals. Among yearling heifers, the last class of shorthorns, but not the least in importance, and the best class of its kind that we have ever seen, Mr. Towneley again carries off the 1st prize, with a roan heifer of remarkable nice quality, getting rather small forward. Its neighbour, 94, is equal, if not superior to the prize animal. The 2d prize is taken by Mr. George Sainbury, with a red and white heifer, by the Duke of Gloucester, shown in the condition just as such things ought to be, and thus in some respects a pattern to others. The prize is awarded in this case to excessive fat, or the 2d prize animal would have been first. Mr. Towneley also shows a very clever heifer by the Fourth Duke of Oxford.

Nos. 100, 101, and 102 are shown by Mr. Kirkham; they are very compact neat heifers, all by Usurer. 106 and 107 are two red heifers (thick useful beasts), shown by Mr. Fletcher, of Mansfield.

HEREFORDS.—The first class includes only 3 bulls, and the 1st prize is taken by Mr. Price, for as perfectly formed an animal, of first-rate quality, as we have seen for some time. The 2d prize animal, belonging to Mr. Carwardine, is a well proportioned useful beast; not, however, anything equal in symmetry to Mr. Price's bull. Among young bulls, the 1st prize is adjudged to Mr. Rea, for a useful beast, by no means first-rate however. The 2d prize is to a fairly formed beast, of good size, belonging to Mr. Powell. Lord Radnor shows a very nice little beast of good quality, in this class. Lord Berwick shows a large good bull in this class, which we should fancy was entitled to the 1st prize; but it is certainly not a *perfect* animal.

In Class 3, for bull calves, but one animal is shown; Mr. Price receives a first prize for it, to which he is well entitled. Among cows, only two appear, the 1st prize is received by Mr. Turner, of Leominster; and the 2d by Lord Berwick. The class of heifers contains but two also, of which Lord Radnor receives a second prize for a very good heifer—well formed, but rather hard in the touch. Of yearling heifers we have five; the best is a well-made, thick heavy fleshed beast. The second prize is a neat heifer, of good quality, and perhaps greater symmetry.

The HEREFORD classes generally are, as may have been expected, represented by but few, the whole width of the island having, in the case of the Lincoln meeting, to be traversed.

DEVONS.—Among old bulls, the 1st prize is carried off by Mr. Farthing, by a bull of first-rate quality and symmetry, having extraordinary depth and width of chest, with a deep good flank. The 2d prize taken by a very level well-formed bull of Mr. Turner, of Barton, near Exeter, having, however, a slightly defective rump. Among young bulls the 2d prize was taken by Mr. Quartley's bull, and we think it ought to have been the first.

141 and 142, shown by Mr. Blomfield, of Wells Norfolk, and Mr. Webber, of Tiverton, are useful animals, but we do not much admire 140, shown by Mr Wright, which carried off the 1st prize.

There were but two in the class of calves, but the prize is rightly awarded to Mr. Turner's No. 144.

Ten cows were shown, and a very good class it i Mr. Farthing takes the 1st prize for decidedly the be

animal in the class. Lord Leicester takes the 2d prize for a very useful animal, good, especially in the hind quarters. Among the heifers Mr. Turner carries the 1st prize for a very nice level beast, which well deserves the distinction. The second goes to Mr. Quartley.

Among the younger heifers the first prize goes to Mr. Turner. Mr. Blomfield of Norfolk shows a heifer of great merit, than which there is nothing more compact in the Devon class. The second prize is taken by Mr. Webber, for a useful animal of good fore quarters.

As to the show in the cattle classes generally, we will only add that our anticipations of a good show have been abundantly realised. The shorthorned classes are decidedly better than we have seen on any former occasion, especially the classes of cows and heifers, many of which are perfection itself. The classes of Herefords and Devons are smaller in number than they have been at previous shows, but this may be accounted for by the greater distance from the scene of the meeting; and we think that the classes have shown greater uniformity in character than we have previously seen. We must continue to express our regret that exhibitors still feel it to be necessary, in order to attain distinction, to run that risk of rendering their animals unproductive, which is incurred by the extraordinary state of fatness to which some of these animals are brought.

The following is the List of Prizes for Cattle, published soon after the opening of the yards on Monday:—

SHORTHORNS.

Judges—Messrs. Thomas Parkinson, Thomas Trotter, and John Wright.

Class 1. Bulls, between 2 and 4 years old: 40*l.*, William Sanday, of Holmes Pierrepont, near Nottingham; 20*l.*, Richard Booth, of Warlaby.

Class 2. Bulls, yearlings: 25*l.*, William Odling, Market Rasen; 15*l.*, Charles Towneley, of Towneley Park.

Class 3. Bull calf, above 6 and under 12 months old: 10*l.*, Charles Towneley.

Class 4. Cow in milk or in calf: 20*l.*, Charles Towneley; 10*l.*, John Booth, of Killerby, Catterick.

Class 5. Heifers in milk or in calf, not exceeding 3 years old: 15*l.*, James Douglas, of Athelstaneford Farm, Drem; 10*l.*, Charles Towneley.

Class 6. Yearling heifers: 10*l.*, Charles Towneley; 5*l.* George Sainsbury, of the Priory, Corsham.

HEREFORDS.

Judges—Messrs. Edward L. Franklin, John Charles Langlands, and John Williams.

Class 1. Bulls, between 2 and 4 years old: 40*l.*, Edward Price, of Court House, Leominster; 20*l.*, John Carwardine, of Stockton Bury, Leominster.

Class 2. Bulls, yearlings: 25*l.* to James Rea, Monaughty, Knighton; 15*l.* to W. Styles Powell, Castle Street, Hereford.

Class 3. Bull-calf above 6 and under 12 months old: 10*l.* to Edward Price, of Court House, Leominster.

Class 4. Cows in milk or in calf: 20*l.* to Philip Turner, of the Leen, Pembridge, Leominster; 10*l.* to Lord Berwick, of Cronkhill, Shrewsbury.

Class 5. Heifers in milk or in calf, not exceeding 3 years old: 15*l.* to William Perry, of Cholstrey, Leominster; 10*l.* to the Earl of Radnor, of Coleshill House, Highworth.

Class 6. Yearling Heifers: 10*l.* to John Walker, of Westfield House, Holmer, Hereford; 5*l.* to Philip Turner.

DEVONS.

Judges—Messrs. Edward L. Franklin, John Charles Langlands, and John Williams.

Class 1. Bulls between 2 and 4 years old: 40*l.* to Samuel Farthing, Bridgewater; 20*l.* to George Turner, Exeter.

Class 2. Bulls, yearlings: 25*l.* to Robert Wright, Taunton; 15*l.* to James Quartley, of South Molton.

Class 3. Bull calf, above 6 and under 12 months old: 10*l.* to George Turner, of Barton.

Class 4. Cows in milk or in calf: 20*l.* to Samuel Farthing; 10*l.* to Earl of Leicester.

Class 5. Heifers in milk or in calf, not exceeding 3 years old: 15*l.* to George Turner; 10*l.* to James Quartley.

Class 6. Yearling heifers: 10*l.* to George Turner; 5*l.* to Thos. Webber, of Halberton Court, Tiverton.

OTHER BREEDS:

NOT INCLUDING THE SHORTHORN, HEREFORD, OR DEVON BREEDS.

Judges.—Messrs. Edward L. Franklin, John Charles Langlands, and John Williams.

Class 1. Bulls between 2 and 4 years old: No competition.

Class 2. Bulls calved since the 1st of July, 1852, and more than 1 year old: 10*l.* to Samuel Burbery, of Wroxhall, Warwick.

Class 3. Cows in milk or in calf: 10*l.* to Captain Inge, of Tamworth: 5*l.* to Samuel Burbery.

Class 4. Heifers in milk or in calf, not exceeding 3 years old: No competition.

Class 5. Yearling heifers: 5*l.* to Captain Inge.

SHEEP.

The show of Leicesters is very large; of short-wools, rather less than usual; while the long-wools have been assembled in far greater numbers than at any previous occasion—indeed, if we include the class of improved Lincolns, we find that they form nearly one-half of the sheep present; although in all other years they have been the smallest class. The numbers in the different classes are as follow:—Leicesters, 89 rams, 12 pens of ewes; short-wools, 55 rams, 12 pens of ewes; long-wools, 72 rams, 24 pens of ewes; improved Lincolns, 42 rams, 6 pens of ewes. The numbers of exhibitors are:—Leicesters, 26; short-wools, 14; long-wools, 20; improved Lincolns, 13; total 73. An inspection of the names of exhibitors will show how well the county of Lincoln has responded to the call of the society—though this point, indeed, is sufficiently obvious from the great gathering of Lincoln sheep. Out of the 26 exhibitors of Leicesters, 6 are Lincolnshire men; out of the 20 exhibitors of long-wools, 4 are Lincolnshire men; which added to the 13 exhibitors of improved Lincolns, gives a total of 23 Lincolnshire exhibitors of sheep; while those from all other counties in England amount to only 50.

LEICESTERS.—Class 1. Shearling Rams: Mr. Pawlett's prize rams struck us as being remarkably fine animals. The first, with broad chine, full deep plates, and good rump, level back, and good fleece; the other of great length, with good scrag, and good thighs. The first measures—girth, 4 feet 10 inches: length, 36½ inches. The second—girth, 4 feet 11½ inches; length, 3 feet 7 inches. Mr. Abraham has two moderately good sheep; one measuring 4 feet 3 in girth, and 3 feet 5½ in length. Mr. Grantham shows good backs and legs, one with a bare loin. Mr. Barton's rams are good as usual, well fleshed, with thick fore-quarters, but some scarcely deep enough through the chest. Mr. Radmore's are useful sheep. Mr. Sonley's rams show considerable length, but a little deficient in frame. Mr. Turner's are good animals, compact, and of fine quality. Mr. Sanday's are broad, with good chines and plates, but too small, and the wool not sufficiently fine. One of Mr. Spencer's is a compact sheep, another has a narrow loin and rump. Lord Berners shows a great sheep with heavy wool, but having a rather narrow fore-quarter. Mr. Kingdom's have inferior backs and fore-quarters. Mr. Mann's are much of Cotswold character, with broad loins, and light wool.

Class 2. Rams of any other age: Mr. Barton's 1st prize sheep is well made, long and wide; measuring—girth, 5 feet 4 in.; length, 3 feet 7 in.; height, 2 feet 7¼ in. Mr. Abraham's 2d prize sheep is large and broad, with wide chine and loin; good full deep plate, good legs, wide rump, and fine bone, in fact, a better animal than the other, but also older. The first measures—girth, 5 feet 4 in.; length, 3 feet 7 in.; height, 2 feet 7 in. The second measures—girth, 5 feet 3½ in.; length, 3 feet 9 in. Mr. Creswell exhibits some rather narrow framed sheep, good in some points, but with rather falling chines. Mr. Sanday's are useful animals, wide, and with good frames, but backs not all well covered, and the wool of second-rate character. Mr. Torr's are good sheep, first-rate mutton, but rather deficient in chine.

Class 3. Pens of five shearling ewes: Mr. Walmesley's beautiful ewes take the first prize. They are compact, well formed, and very fine, with excellent quality of flesh. Mr. Abraham's have the 2d prize; they are very fine, with curly wool, but are certainly not deep enough in constitution.

SHORT-WOOLS.—Class 1. Shearling rams: Mr. Lugar's rams (of which one has the 1st prize); have broad straight backs, great depth, good breasts and twists, and are well filled out; bone fine, wool good; some have loins rather high, or not sufficiently well covered with wool. The Duke of Richmond's, taking the 2d prize, has first-rate chine and fore-quarter, but not a good rump; colour a shade lighter than some others. The measurement of the first sheep are—girth, 4 feet 4½ in.; length (from point of shoulder), 2 feet 8½ in. Another of Mr. Lugar's sheep—girth, 4 feet 6 in; length, 2 feet 8½ in. Of the 2d prize sheep—girth, 4 feet 4½ in.; length, 2 feet 9½ in. Mr. Sainsbury's Downs are not perfectly shaped, have large frames, but not good backs: one measures in girth only 3 feet 3½ in. Mr. Overman's rams are compact and well made, with thick necks and good rumps, but have very much wool. [We venture to add here a remark on the shearing of the animals exhibited. We could point out the sheep shown by the Duke of Richmond, by Mr. Hayward, of Fothington, and Mr. Harrison, of Frocester, and others, as favourably contrasting in this respect with prize animals—some of which, as well as of their unsuccessful rivals, were bare enough over the loin, while the wool was nearly a couple of inches long over and behind the shoulder—presenting to the eye a much more perfect form than on examination by the hand they proved to have.]

Class 2. Mr. Sainsbury's ram, of great length and size, takes the 1st prize; he measures, girth, 4 feet 10½ in.; length, 2 feet 11 in.; height, 2 feet 5 in. Mr. Rigden's rams (one of which has the 2d prize), have considerable length and width, good legs, but some not particularly good fore-quarters. The 2d prize ram measures—girth, 4 feet 7 in.; length, 2 feet 7 in.; height, 2 feet 5 in. A useful sheep of Mr. Lugar's in this class measures—girth, 4 feet 11 in.; 2 feet 10½ in.; 2 feet 5 in. Lord Walsingham shows some very compact useful sheep.

Class 3. Pens of five shearling ewes: Mr. Overman's 1st prize ewes are very fine, and well made. The Duke of Richmond's 2d prize ones are also good, but with less wool.

LONG-WOOLS. — Class 1. Shearling rams: The 1st prize sheep of Mr. Fletcher is certainly of amazing breadth, with fine chest and deep flanks; his head is too short; his girth is 5 feet 3 in. The 2d prize sheep of Mr. Hewer is also a remarkably fine animal, girthing 5 feet 2 in. Mr. Hewer's sheep are more especially worthy of notice, for their firm fine hand and pleasing countenances, as well as for their weight and form. We also admired Mr. Lane's rams, particularly one really marvellous shearling, whose large proportions it was difficult to reconcile with the youthfulness indicated by his teeth.

Class 2. Rams of any other age: both 1st and 2d prizes fell to Mr. Lane; the first of these sheep measuring in girth 5 feet 11½ in., the second, 5 feet 5 in. We have not time to allude to Mr. Game's, Mr. Hardy's, and other noble animals in this class.

Class 3. Pens of five shearling ewes: Mr. Game's prize ewes are certainly as large as some rams, and notwithstanding are of conspicuous beauty of form, and possess other great merits. Mr. Lane's are perhaps equally deserving of attention. Mr. Peel's ewes we considered very inferior, with such thin scrags, and other deficiencies.

IMPROVED LINCOLNS.—Class 1. Shearling rams: In this class, Mr. Abraham had unfortunately entered some of his larger Leicesters, and they have therefore been disqualified. Mr. John Clarke's rams (one of which has the first prize, together with the special prize), combine great size with good proportion of fore-quarter, loin, and rump, and heavy skins. The prize sheep measures—girth, 4 feet 8½ in.; length, 3 feet 10¼ in.; height, 2 feet 6¼ in. Mr. Greetham's (2d prize) is a very good, well-shaped sheep, but head not of good character.

Class 2. Rams of any other age: Mr. John Clarke's rams take both 1st and 2d prizes, together with the special prize. They have certainly great breadth and depth of frame, immense plates, and uncommon good hand, with extra heavy fleeces. The 1st prize ram clipped 51¾ lbs. of wool in three years. His girth is 5 feet 8 in.; length, 4 feet 1 in. The 2d prize sheep measures—girth, 5 feet 4 in.; length, 3 feet 10 in.

Class 3. Pens of five shearling ewes: Mr. Kirkham's prize ewes are a very useful lot, with plenty of wool. Mr. Greetham has also here some well-formed ewes, well made up, but with wool rather too light for this class. In conclusion we may say that the sheep classes generally exhibit very considerable merit. Some of the downs perhaps may be criticised for having been rather too freely pruned by the shears; and every one must remark how severely this class suffers from the absence of Mr. Jonas Webb's unrivalled models. The Leicesters abound with beautiful specimens; the long-wools have their usual gigantic animals, each of which would require several lines of description to do it justice; and the improved Lincolns are certainly not only the largest, but the most praiseworthy and valuable sheep which have yet been exhibited in a local class at the Society's meetings.

The following is the Prize List for the Sheep and Pigs. Some remarks on the latter class we shall be able to give next week.

SHEEP.—LEICESTERS.

Judges—Messrs. Robert Aylmer, W. Harrison, and William Smith.

Class 1. Shearling Rams: 30*l.* to T. E. Pawlett, of Beeston, Sandy, Beds; 15*l.* to the same.

Class 2. Rams of any other age: 30*l.* to John Borton, of Barton House, Malton; 15*l.* to William Abraham, Brigg, Lincolnshire.

Class 3. Pens of 5 shearling Ewes of the same flock; 20*l.* to George Walmsley, Rudstone, Bridlington, Yorkshire; 10*l.* to William Abraham.

SOUTHDOWN, OR OTHER SHORT-WOOLLED SHEEP.

Judges—Messrs. George Brown, John Clayden, and Edward Pope.

Class 1. Shearling Rams: 30*l.* to Henry Lugar, of Hengrave, Bury St. Edmund's; 15*l.*, to the Duke of Richmond.

Class 2. Rams of any other age: 30*l.*, to William Sainsbury, of West Lavington, Devizes; 15*l.*, to William Rigden, of Hove, Brighton.

Class 3. Pens of 5 shearling Ewes of the same flock: 20*l.*, to Lord Walsingham, Merton Hall, Thetford; 10*l.*, to the Duke of Richmond.

LONG-WOOLLED SHEEP. NOT QUALIFIED TO COMPETE AS LEICESTERS.

Judges—Messrs. Hugh Aylmer, Henry Bateman, and William Hesseltine.

Class 1. Shearling Rams: 30*l.*, to George Fletcher, of Shipton, Andoversford, Cheltenham; 15*l.*, to George Hewer, of Leygore, Northleach, Gloucester.

Class 2. Rams of any other age: 30*l.*, to William Lane, of Broadfield Farm, Northleach; 15*l.*, to William Lane.

Class 3. Pen of 5 shearling Ewes of the same flock: 20*l.*, to William Garne, of Aldsworth, Northleach; 10*l.*, to William Lane.

IMPROVED LINCOLN SHEEP.

Judges—Messrs. Hugh Aylmer, Henry Bateman, and William Hesseltine.

Class 1. Shearling Rams: 15*l.*, to John Clarke, of Long Sutton, Lincolnshire; 10*l.*, to Thomas Greetham, of Stainfield, Wragby, Lincolnshire.

Class 2. Rams of any other age: 15*l.*, to John Clarke, of Long Sutton, Lincolnshire.

Class 3. Pens of 5 shearling Ewes of the same flock: 10*l.*, to John Kirkham, of Hagnaby, Spilsby, Lincolnshire.

PIGS.

Judges—Messrs. H. Eddison, John Grey, and Benjamin Swaffield.

Class 1. Boars of a large breed: 15*l.*, to Henry Blandford, of Sandridge, Chippenham; 5*l.*, to the assignees of Samuel Fryer, of Newark.

Class 2. Boars of a small breed: 15*l.*, to William Northey, of Lake Lifton, near Launceston; 5*l.*, to Solomon Ashton, of Peter Street, Manchester.

Class 3. Breeding Sow of a large breed: 10*l.*, to Edward Robinson, of Green Bank Lymm, Warrington.

Class 4. Breeding Sow of a small breed: 10*l.*, to George Mangles, of Givendale, Ripon.

Class 5. Pen of three breeding sow pigs of a large breed, of the same litter, above 4 and under 8 months old: 10*l.*, to William James Sadler, of Bentham Purton, Swindon.

Class 6. Pen of three breeding sow pigs of a small breed, of the same litter, above 4 and under 8 months old: 10*l.*, to the Earl of Radnor.

Veterinary Inspector—Professor Simonds.

SPECIAL PRIZES.

Offered by J. T. Tweed, Esq., mayor of Lincoln.

I. HUNTERS.

Class 1. Hunting Stallions: 40*l.*, to John E. Denison, of Ossington, Newark, Notts.

Class 2. Hunting Gelding or Filly: 20*l.*, to Richard Stockdale, of Skerne, Driffield; 10*l.*, to William Marris, of Great Limber, Ulceby, Lincolnshire.

II.—IMPROVED LINCOLN SHEEP.

Class 1. Shearling Ram: 10*l.*, to John Clarke, of Long Sutton, Lincolnshire.

Class 2. Ram of any age: 10*l.*, to John Clarke, of Long Sutton, Lincolnshire; 5*l.*, to John Clarke, of Long Sutton, Lincolnshire.

Class 3. Pen of five shearling Ewes: 5*l.*, to John Kirkham, of Hagnaby, Spilsby

[We must omit the prize list of poultry till next week.]

HORSES.

THE SHOW OF HORSES may justly be considered as superior to that of the average of former years. The 23 animals shown in Class No. 1, for agricultural stallions of any age, not less than 3 years, were generally of larger frame, and presented a greater variety in their appearance than any exhibition that we remember since that of Northampton. They afforded some excellent specimens of the description of horses most approved of in the midland counties. The 1st prize was awarded to No. 199, a remarkably fine 6-year-old brown stallion, belonging to Mr. James Stockdale, an animal well proportioned, and combining strength and activity in a

considerable degree. The second prize fell to No. 201, a fine and powerful brown horse, the property of Messrs. E. and M. Reed. This animal possessed an almost perfect frame—indeed, the chest was wide almost to fault, and we should have liked him better if his fore-arms had not been quite so far apart; his fore-legs were exceedingly good, and symmetry and strength were happily combined. Next to this animal was No. 200, a remarkably fine and powerful Suffolk horse, belonging to Mr. Biddell, which for some reason was passed over by the judges. No. 202 was highly commended; a Suffolk horse of great strength and compactness, but in whose case the possession of thorough pins no doubt depreciated his other great excellences. This horse took a 2d prize last year at Gloucester. A remarkably fine 3-year-old bay horse belonging to Mr. Savage, No. 212, was also highly commended. This horse bids fair to be a first-class horse, barring the possession of white hind legs; he exhibited strength, symmetry, and activity well combined. This horse was got by No. 214, Honest Tom, belonging to Mr. Gant; a horse possessing vast power, with activity, but showing more hair on his legs than is generally approved of. This horse was commended, as was also Mr. Crisp's Suffolk horse (No. 209), an admirable specimen of this fashionable breed; and a bay horse (No. 197) of great power, belonging to Mr. Gilbert. There were many other animals in this class of great merit; amongst others No. 193, a grey horse, and a black stallion, No. 195.

The 2-year-old class was short in numbers, there being only eight horses entered. Two handsome Suffolk colts, belonging to Mr. Wilson, Nos. 218 and 219, struck our attention. The former was rewarded with the 2d prize, and certainly exhibited much strength and symmetry; 219 bids fair to be a valuable animal, although the hocks approached each other somewhat too much. The 1st prize was, however, awarded to No. 217, a very fine young bay horse, belonging to Mr. Bryan, the gentleman who, if we remember rightly, won the 1st prize at the Northampton Meeting, with a very fine chestnut horse. Nos. 220 and 222 were also nice horses.

Class 3, for colts foaled last year, was not so good as we expected. The prize was given without any difficulty to No. 223, a black Lincolnshire colt of great ize and promise, the owner of which was Mr. Howard. Mr. Catlin's colt, No. 231, obtained the 2d prize. The others were certainly distanced.

We pass over Class 4, the roadster stallions, to that of Class 5, the mares and foals; and here we find a splendid grey mare, No. 251, belonging to Dr. Timon, gaining the 1st prize. Her foal, however, was not so good as the two next in order, Nos. 258 and 260. The former was a remarkably fine bay mare belonging to Mr. Page, near Colchester, with a good foal, to which the 2d prize was awarded; and the latter a brown mare of great strength and activity, with a remarkably fine foal. There were upwards of a dozen exhibited, and amongst them some very useful animals.

Class 6, for 2-year-old fillies, possessed considerable excellence. The prize animal, No. 266, belonging to Mr. Barthropp, was one of the most perfect animals we have ever seen. The 2d prize was given to No. 263, a very fine black filly, owned by Mr. Bayley; whilst Mr. Catlin's Suffolk filly, No. 270, was highly commended. No. 277, belonging to Mr. Wythes, also a Suffolk, was also commended, as well as the class generally, which certainly bids fair to transmit the merits of good cart horses to succeeding generations.

We must postpone our observations on the roadster stallions, as well as on the special classes for hunting stallions, and hunting mares and geldings, until next week.

The following is the prize list for horses:—

Judges—Messrs. J. H. Bland, Wm. Linton, and W. C. Spooner.

Class 1. Stallions for agricultural purposes, foaled previously to the 1st of January, 1852: 30*l.* to James Stockdale, of Hutton Cranswick, Driffield; 20*l.* to Edward and Matthew Reed, Beamish Burn, Chester-le-Street.

Class 2. Stallions for agricultural purposes, foaled in the year 1852: 20*l.* to Frederick Thomas Bryan, of Knossington, Oakham; 10*l.* to William Wilson, of Ashbocking, Ipswich.

Class 3. Agricultural Stallion, foaled in the year 1853: 15*l.* to Robert Howard, of Rise Farm, Nocton, Lincoln.

Class 4. Roadster Stallions: 15*l.* to Joseph Innocent, of Rossington, Bawtry.

Class 5. Mares and Foals for agricultural purposes: 20*l.* to Dr. Timm, of Scrooby House, Bawtry; 10*l.* to Isaac Page, of West Bergholt, Colchester.

Class 6. Two years old Fillies for agricultural purposes: 15*l.* to N. G. Barthropp, of Cretingham Rookery, Woodbridge; 10*l.* to Charles Bayles, of Riseholme, Lincoln.

Poultry.

SHOW AT THE ROYAL AGRICULTURAL SOCIETY'S MEETING AT LINCOLN.—While it has afforded a treat to the lovers of gallinaceæ, it has added fresh proof to the fact that with care and judicious management, there is something of certainty in exhibitions if proper birds be selected, and this is suggested to us by the fact that although Captain Hornby's birds have changed hands, the triumphs they have achieved here will, if possible, add to their prestige. We cannot help reverting to these blue ribands of the poultry world, because it affords us sincere pleasure to find that the purchaser of the stock is able to keep up its reputation. The show comprised 300 pens of choice poultry in all its varieties, save pencilled Hamburghs. Mr. Davies took three prizes in Dorkings, two in Spanish, and one in ducks. Mr. Towneley Parker was deservedly successful in Dorkings and geese. The prize list, which we must postpone till next week, will give the information which the limit of a report forbids. The general commendations are well merited by the Dorkings, Spanish, Polish, and spangled Hamburghs. The ducks and geese were unusually good and Lord Hill took a prize with a pen of remarkably beautiful turkeys.

Carriage of Eggs.—It may be interesting to some of your readers to know the result of an attempt to send eggs from here to America to be hatched there; and as it has been pretty successful it may induce others to try the same mode of procuring poultry of the finer breeds. By one of the New York steamers, which left this in the end of April, I sent a box containing 61 eggs of different selected breeds; they were 12 or 13 days in reaching New York, and on being landed they were sent on 80 miles further by steamboat, and were placed under hens on the following day. Of the number sent, four were broken on the journey, and of the remainder one-half were hatched and were alive on the 27th June, the date of my last communication—a very good result, considering both time and distance, especially as all but one dozen had been brought to Liverpool by railway. *D. J.*

Miscellaneous.

Improvements in the Manufacture of Manure, by Henry Bousquet, of Fenchurch Street, merchant. Patent dated March 19, 1853 (No. 682).—This invention consists in manufacturing manure from sugar scum, by the processes indicated in the claims, which are—1, the purification of the scum by its dissolution in water; 2, the mixture of the scum with black bones, lime, burnt clay, or other calcined substances; and 3, the mixture of the whole (by which combination an artificial manure is produced), and the use thereof for agricultural and other similar purposes. *Mechanics' Magazine.*

Calendar of Operations.

JULY.

BERWICKSHIRE MERSE FARM, *July* 11.—For three or four weeks past the sky has been uniformly cloudy, with dropping and uncertain weather, and an unseasonably low temperature, seldom reaching 60° Fahr. On the 17th and 30th ult. the wind suddenly shifted from the west to north-east, and brought storms of rain, cold and heavy, which flooded the streams and carried away some Turnip drills from the haughs. Little apparent injury, however, has been done to cereals where beyond flood-mark, unless it be to the early Winter Wheat, which was in bloom at the time of the latter "spate." In one or two exceptional cases, the completion of Turnip-making was considerably retarded by the rain of the 17th. But our chief solicitude was lest it should wash out the newly thinned plants before they had regained their footing. They stood it better than could have been expected. More than half of the Turnip break is thinned, and looking well. Any injury sustained from fly has been, contrary to the general rule, among late sowings. Wheat is nearly all in bloom, as also Barley, and both have healthy heads of average size, and plenty of straw. Oats, on the contrary, are very deficient in the latter particular, and only beginning to show the ear. Peas are a strong crop. Beans are short, but from the number of pods set, promise to be corny. The cutting of Clover and Rye-grass for hay was general last week. It improved wonderfully in weight after the rain, and is a fair crop, but the dampness and the entire absence of sun are very unfavourable for making it. Pastures are at their best, and stock improve rapidly. Notwithstanding the prospect of a good Turnip crop, the demand for lean sheep is very inactive, and prices have fallen considerably. Lambs are 2*s.* to 3*s.* cheaper than last year. Comparatively few calves being reared here, store cattle of good quality are scarce, and command extreme prices. *J. T.*

CHESHIRE, *July* 11.—Since our last report a very beneficial change in the weather has taken place in this county. For many weeks the weather continued so dry that farmers became alarmed about all their crops, excepting Wheat, which did not appear to suffer from the extreme dryness of the season, but on the contrary rather improved. Early sown Barley and Oats, too, which received a severe check, will, it is hoped, eventually prove fair crops; but late sown Barley, it is to be feared, will be very light under any circumstances, and hundreds of acres of Oats, sown late upon stiff clay land, will scarcely be worth cutting; for in many instances, the little rain which fell at different times did not reach the grain, consequently it lay dormant in the ground until the 28th and 29th of June, when there were some nice showers, but much too late to benefit those crops materially. About the third and fourth weeks of June the early Potato fields, generally, had an animated appearance, every one engaged in raising early Potatoes being anxious to send them to market whilst they were fetching good prices, and to clear the land for a second crop, such as transplanted Mangold Wurzel and Swedes, the Green Melon Turnip, now in such great repute, &c. The rain above alluded to, which fell about the end of June, has greatly improved the appearance of the winter Potatoes, Mangold Wurzel, and Turnip fields; and the farmers generally are now very sanguine as to the result of those crops. The pastures, too, which were so bare as to compel many farmers to fodder their dairy cows with green Clover, Vetches, &c., in the stalls, have been much improved, and it is to be hoped, with an increase of Grass, there will be an increase of milk, which hitherto has been very deficient, and, as a matter of course, there will be a short make of cheese. *N. C.*

Notices to Correspondents.

NAMES OF PLANTS: *An Old Farmer*. The specimen you have sent is the common Bromus mollis, covered by the eggs of some insect.

TURNIP GROWING: *Young Farmer*. The defect you name may be remedied by mixing damp earth with the guano, by which hand sowing will not be attended with loss of manure, even in a wind. And as to the raised drill, that is considered an advantage wherever the climate is wet enough; the operations of hoeing, during the early growth of the plant, are so much more easily and efficiently performed.

WHEAT: *J W C*. Your Wheat ears have been so long upon the road that it is very difficult to say anything positive about them; three, however, out of the seven are badly affected with rust; the remainder show no trace of fungi, but a more or less partial abortion of the seeds, which in one ear are traversed by a foxy line. Some of the grains are evidently abortive from the attacks of a little orange coloured larva, but we do not think that the abortion of all the grains is due to the same cause. On the whole the affection appears to be what is known by farmers, who have tolerably clear notions as to the diseases with which their corn is affected, under the name of blight, a malady which depends upon some radical defect in the plant, whether constitutional or the result of peculiarities of soil or culture is uncertain. *M. J. B.*

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids. Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

IMPORTANT TO

SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of
BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure, and will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct, the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTRIFICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s*. 9*d*. per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

IT HAS BEEN SAID that the man who makes a single blade of grass grow where none grew before, deserves honour and regard, as having done good service to society. The same holds true of the historian who has depicted the wants and manners of his day, of the inventor who has conceived some plan to abridge labour and economise time, or of the scholar who has smoothed the rugged path of learning. Under various aspects OLD PARR may be considered as a great man. He has left to posterity a remedy for almost all the varied disorders to which the human frame is liable. PARR'S LIFE PILLS have long and justly been acknowledged as having a potent and certain effect, not only in eradicating disease, but in giving vigour, tone, and strength to the system. Invalids suffering from liver complaints, bilious disorders, pains in the back, gravel, lumbago, indigestion, costiveness, loss of appetite, or depression of spirits, should at once make trial of Parr's Life Pills, which will be found a safe and admirable remedy.

ASK FOR PARR'S LIFE PILLS.

Sold by E. EDWARDS, 67, St. Paul's Churchyard; BARCLAY & SONS, Farringdon Street; SUTTON & Co., Bow Churchyard; HANNAY & Co., 63, and SANGAR, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in Town and Country. In boxes, price 1*s*. 1½*d*., 2*s*. 9*d*., and in family packets 11*s*. each.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion Sold by all medicine vendors, price 1*s*. 1½*d*. per box.—Observe that "THOMAS PROUT" is on the Government stamp.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1*s*. 1½*d*. and 2*s*. 9*d*. per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp

HOLLOWAY'S PILLS INVIGORATE THE SYSTEM AND PROMOTE HEALTH.—Mrs. Reynolds, of Burton, had been a great sufferer, for many years, from a complication of nervous diseases, so that her constitution had become very much impaired, which affected both her mental and physical powers; her strength also was completely prostrated; change of air, change of scene, and every available remedy was resorted to without any beneficial effect whatever, as she appeared to be sinking fast. HOLLOWAY'S Pills were commenced at this critical period, and by this unrivalled medicine Mrs. Reynolds speedily derived temporary relief, and ultimately a permanent cure was effected, and she continues to enjoy excellent health.—Sold by all Vendors of Medicine; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

DR. DE JONGH'S
LIGHT BROWN COD-LIVER OIL,
PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS, THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM, AND ALL SCROFULOUS DISEASES.

Approved of and recommended by BERZELIUS, LIEBIG, WOEHLER, JONATHAN PEREIRA, FOUQUIER, and numerous other eminent medical men and scientific chemists in Europe.

Specially rewarded with medals by the Governments of Belgium and the Netherlands.

Has almost entirely superseded all other kinds on the Continent, in consequence of its proved superior power and efficacy,—effecting a cure much more rapidly.

Contains iodine, phosphate of chalk, volatile acid, and the elements of the bile;—in short, all its most active and essential principles,—in larger quantities than the pale oils made in England and Newfoundland, deprived mainly of these by their mode of preparation.

A Pamphlet by Dr. de Jongh, with detailed remarks upon its superiority, directions for use, and cases in which it has been prescribed with the greatest effect, will be forwarded gratis on application.

The subjoined testimonial of the late Dr. JONATHAN PEREIRA, Professor at the University of London, author of "The Elements of Materia Medica and Therapeutics," is selected from innumerable others from medical and scientific men of the highest distinction:—

"MY DEAR SIR,—I was very glad to find from you, when I had the pleasure of seeing you in London, that you were interested commercially in Cod-liver Oil. It was fitting that the Author of the best analysis and investigations into the properties of this oil should himself be the purveyor of this important medicine. I feel, however, some diffidence in venturing to fulfil your request by giving you my opinion of the quality of the oil of which you gave me a sample; because I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. I can, however, have no hesitation about the propriety of responding to your application. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured. With my best wishes for your success, believe me, my dear Sir, to be very faithfully yours,

(Signed) "JONATHAN PEREIRA.

"Finsbury Square, London, April 16, 1851.
"To Dr. de Jongh."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by
ANSAR, HARFORD, AND CO., 77, STRAND,
Sole Consignees and Agents for the United Kingdom and British Possessions; and by all respectable chemists and vendors of medicine in town and country, at the following prices:—
IMPERIAL MEASURE, half pints, 2*s*. 6*d*.; pints, 4*s*. 9*d*.

TO BE SOLD, a NURSERY BUSINESS, in the vicinity of Clapham, with Greenhouses, &c., convenient Cottage, and 1 acre and a half of Land, walled in. Held for an unexpired term of 80 years, at a moderate ground rent.—Apply to Mr. FIELD, Lansdowne Road, Clapham Road, Surrey.

Sales by Auction.

NURSERIES, CLAPHAM.

MESSRS. PROTHEROE & MORRIS are instructed by the Administrators of the late Jos. Fairbairn, to offer for unreserved sale, in the early part of September, the entire stock of specimen Greenhouse and Stove Plants, which are all of the most choice sorts, and in the best condition. The lease of the old established Seed Shop and Nursery to be sold; the Stock may be taken by valuation or by agreement: for particulars apply to the administrators, at the Nursery, Clapham, or to JAMES FAIRBAIRN.—ROBERT SILVESTER BROWN, and CLACK, Administrators, Nursery, Clapham.

CLAPHAM.
GREENHOUSE AND STOVE PLANTS.

MR. J. C. STEVENS has received instructions from Mr. Over, a well-known exhibitor at the Metropolitan Shows, to submit to Public Auction, on the premises, Albion Road, Larkhall Lane, Clapham, on WEDNESDAY, August 2d, and following day, at 12 o'clock, his collection of SPECIMEN STOVE AND GREENHOUSE PLANTS, consisting of Heaths, Azaleas, Allamandas, Ixoras, Dipladenias, Hoyas, Gardenias, a few Orchids, &c., all of which are in the finest possible health. May be viewed the day prior and mornings of Sale; and catalogues had (1*s*. each, returnable to purchasers) by applying to Mr. OVER as above, or to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

ORCHIDS.
ESTABLISHED AND IMPORTED PLANTS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on MONDAY, 24th July, and following day, at 12 for 1 o'clock precisely, a collection of very rare and well grown established Plants, including many choice specimens of Aerides, Vanda, Saccolabium, Cattleyas, Phalænopsis, &c., some Pine Cones from California; also importations from La Guyara and Guatemala, and three Cases from the East Indies, containing Amherstia nobilis, Tropical Fruits, &c.—May be viewed on the mornings of Sale, and Catalogues had.

HACKNEY.

IMPORTANT SALE OF THE MATERIALS OF MESSRS. LODDIGES' EXTENSIVE HOTHOUSES AND CONSERVATORIES. PITS AND FRAMES, WITH THE CELEBRATED PALM HOUSE, INCLUDING 1,000,000 STOCK BRICKS.

PULLEN AND SON, in conjunction with Mr. J. C. STEVENS, respectfully announce that they are instructed by Messrs. Loddiges (in consequence of the disposal of their celebrated collection of Plants to the Crystal Palace Company), to Sell by Auction, on the Premises, on THURSDAY, August 17, the whole of the valuable BUILDING MATERIALS and FITTINGS-UP of the celebrated Palm House, extensive ranges of Hothouses and Conservatories, Pits and Frames, Seed Rooms, and various buildings, covering a very large extent of ground in Mare Street, Hackney, comprising 1,000,000 excellent stock bricks, 2000 feet run of glazed lights and frames, about a superficial acre of glass in the hothouses and conservatories, two miles of 4-inch iron flange pipe, with 14 large wrought-iron boilers, and all the hot-water heating apparatus complete, 10,000 feet of York paving, a most expensive conservatory, 100 feet long by 20 wide, with copper sash bars and framing, 5000 feet of shelves and boarded stages, pan and paving tiles, seed drawers, counters, and all the implements of trade, and a variety of valuable materials and fittings-up, particularly adapted for horticultural purposes. May be viewed two days previous.—Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden; and of PULLEN & SON, 80, Fore Street, Cripplegate.

MESSRS. BAKER AND SON are honoured with instructions by Sir John Tyssen Tyrell, Bart., M.P., to Sell by Auction, on TUESDAY, August 15, at the Cheese House Farm, Boreham, Essex, at 12 o'clock, without reserve, a superior FLOCK of pure SOUTH-DOWN SHEEP, consisting of 218 Ewes, 152 Lambs, 50 fat Wethers, and 20 Rams; also two curious improved Leicester Rams, and seven fat Wethers, of Lord Talbot's breed; 14 improved Short-horned Heifers and Steers, one fat do. Cow, five superior Cart Horses, and two Colts, &c. The Sheep have been bred and crossed at great expense from the flocks of the first breeders in the kingdom, are large in frame, and of excellent symmetry and age. The horses are in constant work, are young and sound, and will be sold without reserve. Sir John Tyrell having let his farm.—Catalogues may be had at the York Hotel, New Bridge Street, Blackfriars, London; at the principal Inns in the market towns of Essex; and of the Auctioneers, Chelmsford and Writtle, Essex.

AT A MEETING held at 21, Regent Street, London, on Monday, July 10, THOS. RIVERS, Esq., of Sawbridgeworth, in the chair,—it was proposed by Mr. Hogg, seconded by Mr. Edwards, and carried unanimously,—

1. That a Society shall be established, to be called the BRITISH POMOLOGICAL SOCIETY.

2. That the Society shall have for its objects the promotion generally of Fruit Culture in the British dominions. That it shall especially direct attention to the production of new varieties of Fruits, examining and reporting on their merits, and endeavouring to classify the Fruits of Great Britain, the European continent, and America.

3. That the Entrance Fee be Ten Shillings.

4. That the Annual Payment of Ten Shillings shall constitute a member, and shall be due and payable on the 1st of August in each year.

5. Resolved that the following gentlemen, having signified their desire to become members, are hereby duly elected:

Sir Joseph Paxton, Kt., Chatsworth
Rev. Reginald Chandos Pole, Rudbourne, Derby
Robert Hanbury, Esq., The Poles, Herts
H. Bellenden Ker, Esq., Chesbunt
Geo. Wm. Johnson, Esq., Winchester
Chas. Lawson, Esq., Edinburgh
T. Ingram, Esq., Royal Gardens, Windsor
John Edwards, Esq., Holloway, Middlesex
Mr. John Jennings, Knowsley, Lancashire
Mr. Geo. Thompson, Bramham Park, York
Mr. George M'Ewen, Arundel Castle Gardens
Mr. John Spencer, Bowood, Wilts
Mr. T. Rivers, Sawbridgeworth
Mr. Thos. Francis Rivers, Sawbridgeworth
Mr. John Lee, Hammersmith
Mr. Hugh Low, Clapton
Mr. John B. Whiting, The Deepdene
Mr. F. J. Malleson, Claremont
Mr. T. Moore, Botanic Garden, Chelsea
Mr. J. Ingram, Huntingdon
Mr. W. Davidson, Shrubland Park, Ipswich
Mr. James Burbank, Grittleton, Wilts
Mr. Wm. Rowell, Harporley, Durham
Mr. Wm. Breadley, Somerleyton, Suffolk
Mr. W. Tillery, Welbeck, Notts
Mr. Jas. Garraway, Durdhamdown, Bristol
Mr. John Sanders, Tedworth, Wilts
Mr. T. Taylor, Covent Garden
Mr. Robert Hogg, Brompton
Mr. Charles Wood, Maresfield, Sussex
Mr. J. Powell, Royal Gardens, Frogmore
Mr. Charles Turner, Slough
Mr. Wm. Dean, Slough
Mr. Wm. Thomson, Wrotham Park, Herts
Mr. Holmes, Handsworth, Sheffield
Mr. Peter Lydiard, Bath
Mr. James Kitley, Bath
Mr. J. Jeffries, Cirencester

6. Proposed by Mr. Edwards, seconded by Mr. Turner, and carried unanimously,—That Sir Joseph Paxton, Knt., shall be President of the Society.

7. That Robert Hanbury, Henry Bellenden Ker, and Thomas Ingram, Esqs., shall be Vice Presidents.

8. That Mr. Spencer shall be Treasurer and Secretary (*pro tem.*)

9. And that Mr. T. Rivers, Mr. J. Lee, Mr. Hogg, Mr. G. W. Johnson, Mr. M'Ewen, Mr. Whiting, Mr. Powell, Mr. Turner, Mr. Edwards, Mr. Moore, Mr. Thomson (Wrotham), Mr. Malleson, Mr Davidson, Mr. Low,—be elected a Committee of Management, with power to add to their number.

10. Proposed by Mr. Hogg and seconded by Mr. Rivers, that the above Resolutions be advertised in the *Gardeners' Chronicle*, "Cottage Gardener," and "The Florist."

JOHN SPENCER, Secretary.

A GRAND EXHIBITION OF HOLLYHOCKS, Open to the United Kingdom, will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on TUESDAY, August 22. A Subscription is now open for the purpose of raising a fund of sufficient magnitude to distribute Prizes to Nurserymen and Amateur Growers worthy the merits of this noble and popular flower. It is intended to offer a Silver Cup, value 5*l*. 5*s*., to each class for spikes in flower, with valuable descending Prizes of Gold and Silver Medals. Cut Blooms also will receive their due share of attention. In addition to the above, Gold and Silver Medals will be awarded for Miscellaneous Collections of Stove and Greenhouse Plants, Specimen Plants, Dahlias, Roses, &c.

COMMITTEE.—Messrs. W. Barnes, Peckham; J. W. Bircham, Bungay; W. Bragg, Slough; W. Chater, Saffron Walden; W. Paul, Cheshunt; A. Parsons, Ponder's End; Roake, Clewer; and C. Turner, Slough, by whom subscriptions will be received, also by the Secretary. Lists of Prizes, with Rules of the Exhibition, may be obtained of the Secretary, J. T. NEVILLE, Ebenezer House, Peckham.

ISLEWORTH HORTICULTURAL FETE. — SCHOOL TREAT AND JUVENILE REGATTA, under distinguished patronage, will take place on AUGUST 11th, instead of the 8th, as previously advertised (on account of the Thames National Regatta being fixed for the 8th), in the GROUNDS of GORDON HOUSE, by kind permission of Hamilton Cooke, Esq., and Saint Margarets, by kind permission of the Committee of the Conservative Land Society, on the banks of the Thames, when prizes open to all England will be awarded for FLOWERS, FRUITS, and VEGETABLES.—Further particulars may be obtained on application to HICKSON BRIGGS, Hon. Sec.
Holland House, Isleworth, July 29.

CHEPSTOW HORTICULTURAL SOCIETY.—The second and last Show for this season will take place on THURSDAY, September 7, 1854, when the undermentioned prizes will be given:—For the best collection of 12 Stove and Greenhouse Plants (given by the inhabitants of Chepstow, open to all England), first prize, a Silver Cup, value 10*l*. 10*s*.; second ditto ditto, 5*l*. 5*s*. N.B. The second prize given by the Society.—Calceolarias, Fuchsias, Orchids, and Pelargoniums, will be excluded from the above collection. For the best Stand of 24 Bunches of Roses, of different names, not more than 3 stems in a bunch, with their own foliage and buds (given by the Wye Steam Packet Company) open to all England. First prize, a Silver Cup, value 5*l*. 5*s*.; second ditto, a Piece of Plate, 2*l*. 2*s*.; N.B. The 2d prize given by the Society. For the best Stand of 36 Dahlias (given by the Society) open to all England. First prize, a Silver Cup, value 5*l*. 5*s*.; second ditto, a Piece of Plate, 2*l*. 2*s*. By the kind permission of Colonel the Hon. Arthur Upton, the band of the Coldstream Guards will perform during the fête. Exhibitors are requested to make an early application for schedules, which may be obtained of the Secretary, Mr JOHN F. HARTLAND, Welsh Street, Chepstow.

STANDISH & NOBLE'S Catalogue for the present season is now ready, and may be had by inclosing two stamps for postage.—The Nursery, Bagshot, July, 1854.

ROBERT SIM'S NEW CATALOGUE of more than 250 species and varieties of STOVE, GREENHOUSE, and HARDY EXOTIC and BRITISH FERNS, &c., can be had for one stamp.—Nursery, Foot's Cray, Kent.

CHOICE SEEDS.—Splendid mixed Sweet William, Antirrhinum, Primula sinensis fimbriata, Calceolaria, and Cineraria, Chater's Hollyhock, 1*s*. and 2*s*. 6*d*. per packet. Can be strongly recommended; saved only from the best flowers. Catalogues free by post.

DAWE, COTTRELL, & BENHAM (successors to F. Warner), Seedsmen, 36, Moorgate Street, and 3, Laurence Pountney Lane, City, London.

Agents for Butcher's Barbarossa Vines, M'Adam's Anti-Grape Blight Composition, and Cole's Concentrated Animal Manure.

MAY'S PARAGON CABBAGE.—Prepaid postage. The above superb CABBAGE can still be had in 1 oz. packets, 1*s*. each. Sow July and August.

Also new CINERARIA SEED from the best named flowers, in packets, 2*s*. 6*d*. each.

Address, HENRY MAY, the Hope Nurseries, near Bedale, Yorks.

THE QUEEN OR CAULIFLOWER CABBAGE.—The above Cabbage is of most delicate flavour, quite equal to the Cauliflower; very early, and requires good ground. The stumps left in the spring after the Cabbages are cut will reproduce Cabbages all the summer, so that persons growing this kind need not make more than one good bed in the year. It should be sown this month, and planted out in September.—1*s*. per oz.

LONDON MARKET CABBAGE.—Saved from a very choice stock. This kind is of larger growth than the Queen, and will do well for exposed situations.—1*s*. per oz.

The above sent free by post on the receipt of postage stamps or a post-office order.

JOSEPH SHILLING, Nurseryman and Seedsman, Winchester.

BULBS FOR EARLY BLOOMING.

B. PAGE AND CO. beg to offer FINE FLOWERING ROOTS.

DOUBLE ROMAN NARCISSUS ...	4*s*. per dozen.
PAPER WHITE DO.	4*s*. "
LARGEST DOUBLE JONQUILS ...	2*s*. 6*d*. "

Their first importation having arrived.

Oxford Street Seed Stores, Southampton.

New Seed, OWN GROWTH, CHIVAS'S ORANGE JELLY TURNIP, 1*s*. 9*d*. per lb., large quantities cheaper.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS:—

12	Orchidæa, fine specimens, one of a sort by name, including Dendrobiums, Stanhopæas, Oncidiums, Epidendrums, Maxillarias, Peristerias, Vanda, &c.	40*s*. 0*d*.
50	Greenhouse Plants, choice hard-wooded varieties, one of a sort by name	45 0
24	Choice Ericas, one of a sort, in small pots	16 0
12	Superb New Climbers, for Conservatory	18 0
12	Hardy Climbers, Roses, Passifloras, Jasmines, &c...	10 0
	Choice Grape Vines, from eyes, in pots, per dozen ...	18 0

Albion Nursery, Stoke Newington, London.—July 29.

CHIVAS'S NEW ORANGE JELLY TURNIP.

BASS AND BROWN have just harvested Seed of the above quick growing Turnip, also the large Lincolnshire Red Globe and other Turnips.

Chivas's Orange Jelly, 16*s*. per peck, or 1*s*. 9*d*. per lb.

Early Mousetail Stone, a very quick growing and fine sort, 12*s*. per peck, 1*s*. 2*d*. per lb.

Lincolnshire Red Globe, very large, 15*s*. per peck, 1*s*. 2*d*. per lb.

Norfolk White and Green Round, also White and Red Tankards, 12*s*. per peck, 1*s*. 2*d*. per lb.

Agricultural Seed Lists on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

FERNS AND LYCOPODIUMS.

E. COOLING begs to offer the following, in good Plants:—

12 choice Ferns and Lycopodiums, suitable for a Wardian case, Gold Fern included ...	15*s*. and 20*s*.
12 choice Indian Azaleas, to name	12*s*. and 18*s*.
6 finest new Verbenas	6*s*. and 9*s*.

The Nurseries, Derby.—July 29.

SEEDS OF CALCEOLARIA AND CINERARIA.

E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, the new Seed saved this season from their unrivalled collection, in packets at 2*s*. 6*d*. and 5*s*. each.

The CALCEOLARIA, first quality	5*s*. 0*d*.
" second "	2 6

QUALITY, and not QUANTITY, forwarded at the above prices.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out new seed of this year's saving, which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s*. 6*d*. and 2*s*. 6*d*. each; also a few packets of choice Cineraria Seed at 1*s*. 6*d*. and 2*s*. 6*d*. each. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.—July 29.

CALCEOLARIA SEED, from the most splendid varieties in cultivation, some of which (by competent judges) have been pronounced almost perfect. They have been admired by thousands during the present summer. Great pains have been bestowed in crossing the best flowers, so that a great improvement is fully anticipated.

Price 2*s*. 6*d*. per packet, free by post.

JOHN KER, FLORIST, Bristol Road, Birmingham.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE begs to intimate that he has now ready for sale choice Seed of Calceolaria and Cineraria. The collection of Calceolarias from which the Seed now offered was saved forms an unrivalled one, and has been the admiration of all who have seen it; they possess every variety of colour peculiar to the genus, fine shapes, and have been awarded several first-class Certificates. Great care has also been taken in selecting the Cineraria from none but first-rate flowers; and, like the Calceolaria, it is warranted to give satisfaction.—Packets of both, 2*s*. 6*d*. each, will be sent on receipt of postage stamps to the amount.—Streatham Place Nursery, Brixton Hill, near London.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy. RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15*s*. per 100, or 25 each of any two sorts for 10*s*., box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.

Eggliscliffe, near Yarm, July 29.

GRAPE VINES FROM EYES, IN POTS.—The undersigned has now to dispose of a large stock of GRAPE VINES raised from eyes this season, strong, and in vigorous health, now exposed to greenhouse temperature, and hardened so that they can be sent safely to any part of the kingdom without check or injury. By planting now, a whole season will be saved. They comprise all the leading kinds, and an inspection of them is respectfully solicited.

R. GLENDINNING, Chiswick Nursery, near London.

TO AMATEURS, NURSERYMEN, AND FLORISTS. THE ADVERTISER is desirous of parting with his choice stock of AURICULAS, which comprise about 80 plants of the very best varieties, in good health, including—Fletcher's Ne Plus Ultra, Smith's General Bolivar, Hudson's Apollo, Sykes's Complete, Taylor's Glory, Dickson's Duke of Wellington, Maclean's Unique, and others.—Apply to Mr. H. JUDD, Warwick House, Warwick Road, Paddington, where they can be seen.

ROSE NURSERIES, HERTFORD.

EDWARD PARKE FRANCIS will exhibit at MR. DENYER'S, 82, Gracechurch Street, all through next week, sample flowers of that splendid Hybrid Perpetual Rose, LEON DES COMBATS, grown on the MANETTI STOCK.

THOMAS BEACH, the well-known Strawberry Grower, begs to inform the public that he has now ready a large stock of fine strong Plants of his true British Queen, the same he beat the whole world with at the Crystal Palace, many of them weighing from two to three oz. each, likewise the same he gained the Knightian Medals at Chiswick, and many other places; that he has gained the Head Prize, and surprised the world, both in flavour and weight. Fine strong Plants sent to any part of the world at 5*s*. per 100, box included. Post-office Orders on Hounslow, to Mr. THOS. BEACH, Strawberry Grounds, Worton, Isleworth, Middlesex.—July 29.

CHOICE SEEDS FOR PRESENT SOWING.—Free by post at the prices annexed:

CABBAGE, Cattell's Dwarf Barnes, 1*s*. per oz. packet,
" " Reliance, 1*s*. per half-oz. do.

ANEMONE, Single Poppy, very fine, mixed, 6*d*. per packet, or 3*s*. per oz.
" " " saved from all scarlet flowers, 6*d*. p. pkt.
CALCEOLARIA, from fine sorts carefully hybridised (with directions for sowing, &c.), 2*s*. 6*d*. per packet.
CINERARIA, from finest varieties, 2*s*. 6*d*. per packet.
GERANIUM, from newest florist varieties, 12 seeds, 2*s*. 6*d*. p. pkt.
" from fine older do. do. 12 seeds, 1*s*. per packet.
MIMULUS, mixed, from very finest varieties, 6*d*. per packet.
PRIMULA SINENSIS, fine fringed pink varieties, 1*s*. p. packet.
" " " " white do., 1*s*. per packet.

A remittance or reference to accompany all orders from unknown correspondents.

Address, JOHN CATTELL, Westerham, Kent.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY.

JAMES VEITCH, JUN., has the pleasure to inform the public that Mr. Patterson, Gardener to Baroness Wenman, of Thame Park, Oxon, has placed in his hands for distribution the stock of the above first-rate Seedling Strawberry, which, having been fully tested and exhibited, has proved to be of very superior excellence.

It was exhibited at Chiswick, on Saturday, June 3, and received the Silver Knightian Medal; it has also been submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom report most favourably of its merits.

It is a *first-class forcing* Strawberry in character, intermediate between *its parents—Keens' Seedling* and *Queen*, of the vigorous habit of the *former*, and fully one week earlier in ripening; and in the quality of its fruit *fully equal* in flavour, if not superior, to the latter. The fruit is of a large size and handsome shape, of a *bright red colour*, and with a remarkably high perfume.

Orders are now taking for strong plants to be sent out the first week in September on the following terms:—

100 Plants ... £3 | 50 Plants ... £2 | 12 Plants ... 12*s*.

Exotic Nursery, Chelsea.—July 29.

WARD'S "OMER PACHA" STRAWBERRY.

W. J. WARD (by permission of his employer, W. Stephens, Esq.,) offers to his friends and the public the above Seedling Strawberry, which has been proved to possess superior excellence. It is a large handsome fruit, intermediate between the old Carolina Pine and British Queen, partaking of the fine colour of the former, and by many considered superior in flavour to the latter; it is also remarkable for the fine buttery quality of its flesh. Great bearer; ripe as early as Keens' Seedling, affording a long succession of fine fruit. It was exhibited at the Royal Botanic Gardens, Regent's Park, on Wednesday, the 5th of July, and obtained the Bronze Medal. It has also been submitted to Mr. Marnock, Regent's Park, London; Mr. Thompson, Horticultural Society, Chiswick; and Mr. Spencer, Bowood, all of whom speak highly favourably of it. Also the following, who have pronounced it first-rate, and are open to take orders for it:—Messrs. Henderson, Pine-apple Place, London; Mr. C. Turner, Royal Nursery, Slough; Messrs. Standish and Noble, Bagshot; Mr. P. Lydiard, Fruiterer, Bath-easton, Bath; Mr. W. J. Epps, Bower Nursery, Maidstone; Messrs. Sutton, Reading; Mr. W. Barnes, Camberwell; Mr. Lewis Solomon, Fruiterer, Covent Garden.

Strong well rooted plants last week in August. Terms, cash or reference.—100 plants, 3*l*.; 50 plants, 1*l*. 15*s*.; 25 ditto, 1*l*. A few strong plants in 32-sized pots, 15*s*. per dozen.

Prospect Hill, Reading, July 29.

MCADAM'S ANTI-GRAPE BLIGHT COMPOSITION.—"This will soon become the *standard remedy*, as it fully deserves to be."—(See *Gardeners' Chronicle*, July 1, May 27, June 10, &c.) 1 lb. packets, with full printed instructions, 3*s*. 6*d*. each, sufficient for 18 gallons of wash.

Agents:—DAWE, COTTRELL, & BENHAM, 36, Moorgate Street, London. It can be ordered through any country Bookseller.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s*. per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s*. 3*d*. and 2*s*. 6*d*. each. Directions for application forwarded. Ten gallons and upwards carriage free to London.

For testimonials, see whole page of *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth.

From Andrew Toward, Esq., Royal Gardens, Osborne Palace.

"I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose Trees much affected with the Green Fly."

From Frederick Malleson, Esq., Royal Gardens, Claremont.

"I find it answer the purpose in all respects for Walls, also the Green Fly and Brown Scale in the Houses.—May 9, 1854."

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton (20 yards from the Railway and Docks)

ROSES.

G. CLARKE respectfully invites the attention of lovers of Roses to his unrivalled Collection, extending over 10 acres of ground, which may now be seen in full bloom. Plants can be selected now and orders executed in the autumn.

Streatham Place Nursery, Brixton Hill, near London; four miles from London. The nearest and most pleasant route from the West End to the Crystal Palace.

PINUS CEMBRA.

WANTED to purchase 5000 of the above, from 6 to 12 inches.—Address W. W., Bakewell, Derbyshire.

SPLENDID CALCEOLARIA, CINERARIA, & SWEET WILLIAM SEED.

WILLIAM BARNES respectfully begs to inform his friends and he public generally, that he has now ready to send out in packets, at 2*s.* 6*d.* each, seed of his unrivalled Herbaceous Calceolarias, which has given so much satisfaction for two years; the varieties have been selected with the greatest care, and none but the finest colours and best shaped flowers have been retained and carefully hybridised.

W. B. has for two years paid great attention to the improvement of the SHRUBBY BEDDING CALCEOLARIA, having purchased all the best kinds from the most eminent growers, and selected from them while in bloom the best shapes, finest colours, and most perfect shrubs; by careful hybridising he has succeeded in raising some first-rate varieties, and is now enabled to offer a few packets of fine new seed at 5*s.* per packet; this W. B. feels assured will give as much satisfaction as his herbaceous varieties have done before, which numerous letters he has received from various parts of the United Kingdom will testify.

CINERARIA SEED, saved from none but the very best and newest varieties in cultivation, at 2*s.* 6*d.* per packet.

The SWEET WILLIAMS have been grown in his Nursery Grounds for two successive years, and have caused universal admiration from all those who have seen them in bloom; nothing can be more beautiful for either clumps or borders, and they retain their great beauty for a very long time. Packets of fine seed at 1*s.* 6*d.* each. A remittance is expected from unknown correspondents.—Camden Nursery, Camberwell, London.

THE NEW RHODODENDRONS OF ASSAM AND BOOTAN.

EXHIBITED AT CHISWICK ON SATURDAY, JULY 8TH, BY MR. J. VEITCH, JUN., OF CHELSEA.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to say that in consequence of some remarks having been made to them respecting the above, and other reports having been circulated, originating, as they have been given to understand, from the Exotic Nursery, Chelsea, and which they are sure can have no foundation, think it right to put the readers of this Journal in full possession of the facts—which are, that in the month of March of the present year, Mr. Veitch was in communication with Mr. Nuttal respecting the above Rhododendrons, and in a letter dated the 16th March, Mr. V. requested to have a single plant of the following varieties for inspection, which were accordingly forwarded to him, viz., Keysi, Nuttali, Kendricki, eximium, longifolium, lucidum, calophyllum, and Camelliæflorum; and no other plants have subsequently passed into his hands from Mr. Nuttal.

Messrs. E. G. H. & Son were quite aware of this circumstance at the time of purchasing, and that a few other plants had previously left the collection of Mr. Nuttal.

Wellington Nursery, St. John's Wood, July 29.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

Squares	6 by 4 and 6½ by 4½	...	13 6
„	7 by 5 and 7½ by 5½	...	13 6
„	8 by 6 and 8½ by 6½	...	13 6
„	9 by 7 and 9½ by 7½	...	16 3
„	10 by 8 to 12½ by 9½	...	16 3
„	12 by 10 to 24 by 14	...	19 0

Orchard House Squares on Mr. Rivers's approved plan, to whom I have sold some thousands of feet:—20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20½ by 12½, 20½ by 13½, 20½ by 14½, at 19*s.* per 100 ft.

200 feet cases at 42*s.*, and 300 feet case 63*s.*, in large sheets.

Boxes charged 1*s.* extra per 100 feet, and the same allowed if returned free of all charge.

HARTLEY'S PATENT ROUGH PLATE GLASS, Fern Shades, Striking Glasses, Milk-pans, Bee Glasses, Cucumber Tubes, Sheet and Rough Plate Glass Tiles, Wasp Traps; Plate, Patent Plate, Crown and Sheet Window Glass, in every thickness and quality, and Ornamental Glass, plain and coloured; pure white Shades for Ornaments, Crystal Glass for Pictures.

Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	...	...	10*s.* 6*d.* per box.
7 „ 5 „ 7½ „ 5½	...	...	12 0 „
8 „ 6 „ 8½ „ 6½	...	...	13 6 „
9 „ 7 „ 9½ „ 7½ and 10 by 8	...	...	15 0 „

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,
116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depot.

HARTLEY'S PATENT ROUGH PLATE, for Roofing Conservatories, Halls, and Public Buildings.

PLATE, CROWN, and SHEET WINDOW GLASS.

Coloured and Ornamented Glass of every description.

Glass Milk Pans, Pails, Tests, and Measures; Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Moore's Patent Ventilator and Lockhead's Patent Perforated Glass, for Dairies and Greenhouses.

Aquaviariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign, at the lowest prices.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

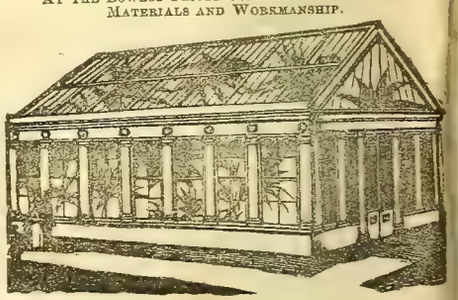
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

THE

NEW RHODODENDRONS OF ASSAM A NDBOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Journal of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched in October. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

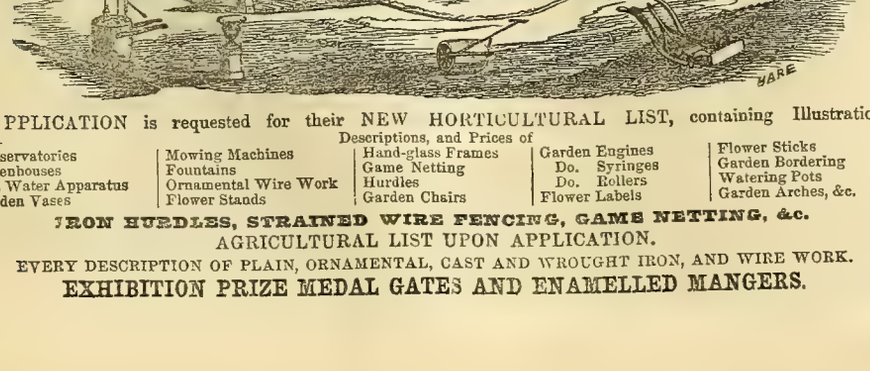
NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, July 29.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

NEW FUCHSIAS OF 1854, sent out by Banks and others. The set of 17, well established plants, for 34s., or any 12 for 28s.:—Stokes' Duke of Wellington, Smith's Telegraph, Kimberley's Henry Monteith and Globosa splendens; Banks' Autocrat, Charmer, Vanguard, Queen of Hanover, Elegans, Clio, and Magnifica; Cole's Trentham, Henderson's Monarch; Batten's Charles Palmer, Grandissima, and Admiral; Standish's Perfection.

NEW VERBENAS OF 1854, sent out by Banks, Keens, Smith, and others. A selection of any 30 from the following may be made for 40s., or, per dozen, 18s.:—Keynes' Ajax, Arethusa, Captivation, Emily, Lord Mayor, and Magnet; Barnes' Lutea pallida, and Madonna; Smith's Peter Dick, Nobilissima, Climax, Eblouisante, Angelina, Queen, Alice, Scarlet King, Forget-me-Not, Zaria, Caliban, Giralda, Islington Rival, Magnificent, Laura superba, and Triumph; Robinson's Mrs. D. Tyssen; Edmunds' Rouge et Noir, and President; Banks' Orion, Robin Hood, Marie Antoinette, Matchless, Beauty, Madonna, Attraction, Diadem, Ne Plus Ultra, and Arioste; Fozart's Beauty of the Garden; Stewart's Sulphur Model, and Ida; Igley's Honeysuckle; Bragg's Standard, Fair Rosamond, Incomparable, Lord Seaton, King of Purples, Queen of Roses, Prince of Wales, Venus, and Queen of Purples; Mein's Leucostemma, Mitchell's Elegantissima.

NEW PETUNIAS OF 1854, the nine varieties for 14s.:—Kimberley's Novelty, Van Houtte's Striata formosissima; Barnes' Elizabeth, Distinctus, Pencillata, Rotunda, Alba magnifiora, and Formosa; Smith's Montreal Purple.

BASS AND BROWN,
SEED and HORTICULTURAL ESTABLISHMENT, Sudbury, Suffolk.

The Gardeners' Chronicle.

SATURDAY, JULY 29, 1854.

AMONG the many striking instances of horticultural skill, exhibited at the last meeting at Chiswick, nothing attracted more attention than a terrestrial Orchid, well known to amateurs under the title of Disa grandiflora. From among some grassy leaves this gorgeous plant sends up a stem bearing erect some three or four flowers, each as large as a lady's hand, and of the richest crimson, melting into yellow.

It occurs at the Cape of Good Hope, and in no other part of the world. In that colony its favourite haunt is Table Mountain, where, according to Dr. HARVEY, it is so common that every stream is literally bordered with it in March. Sir JOHN HERSCHEL tells us that the temperature of the situation where it occurs is *occasionally* as low as 31½°, and also occasionally as high as 96½°. It lives on the borders of pools of standing water, the drainage of the boggy slopes of the mountain, in which its roots are immersed. These are dry or nearly so in summer. But it is frequently involved in the dense mists of the clouds, which, even in the hottest months, often prevail for a week or fortnight at a time.

These facts, and his own observations, appear to have suggested to Mr. LEACH that skilful course of treatment which has led him to such entire success. How he proceeds we learn from a letter with which he has favoured us:—

"I would say that my success in growing it has, I think, resulted simply from treating it as a greenhouse plant, and not drying it off for rest, as is usually done with Cape bulbs. I have not yet been able to perceive that my plant has ever been perfectly at rest; leaves seem either to be lengthening or offsets coming up—it was this peculiarity which determined me upon continuing to give it water all the year round—moderately, of course, during winter, while the thermometer was ranging between 35° and 45°, and freely during the other parts of the year.

"I suspect that, in its native habitats, though long continued heat and drought may cause all foliage to die down, the roots, nevertheless, in the ravines where I understand it grows, remain continually moist. With me, however, a change of habit seems to take place, and the offsets of last autumn and winter become the flowering plants, not of this, but of next year; whilst those now in flower will die down, leaving an abundance of plants, scarcely half grown, and followed soon afterwards by fresh offsets.

"Rough fibrous peat is the soil I use, with a good portion of silver sand; good drainage, of course—and, from the results I have obtained, I see no reason why this very beautiful species should not be found in the greenhouses of every one disposed to bestow the same care upon it which he gives to his Geraniums, and such like plants."

In this belief we concur, provided always a master's eye is present, to insure the plant against that neglect or forgetfulness which kills more fine plants in a year than merely bad cultivation in a century.

Mr. DRUMMOND's Committee on the WOODS and FORESTS has made its report; but the evidence is not yet printed. During its sittings Sir WILLIAM HEATHCOTE was discharged from attendance, and was replaced by Mr. JAMES WILSON. When the name of the latter gentleman was proposed in the House by Mr. HAYTER, and Sir JOHN SHELLEY objected to him, Mr. WILSON himself is reported to have said that it would be *unseemly* if he should not be on the Committee; (the honourable gentleman has very peculiar ideas of unseemliness). In this way two Treasury officers acted upon a Committee appointed to enquire into matters in which the conduct of the Treasury was to be examined; and Lord HOTHAM never having attended, one-seventh of the Committee was thus made up of Treasury officers.

The Committee have differed greatly among themselves as to the terms of their report, Mr. DRUMMOND's draft having produced, brief as it is, no fewer than six divisions, in four of which the Treasury succeeded in obtaining a majority. The Report, as agreed to, declares that—

"Except in the Forest of Dean and the New Forest, there is scarcely any timber at present of sufficient age for navy purposes; nor is there likely to be for many years to come. The Forest of Dean, which lately contained 22,000 loads, now contains only 4000. The Forests of Alice Holt, Woolmer, and Delamere contain none. The Forests of Hainault and Epping have long since ceased to bear timber, and are now devoted to agriculture. In the New Forest, out of 2635 loads felled, consisting of 3115 trees, only 936 loads were accepted by the Surveyor of the Navy; so large is the proportion of faulty to sound trees."

Mr. LIPSCOMBE and his forest of Delamere is thrown overboard. New Forest fares little better. In Alice Holt, Bere, and Parkhurst the management is declared to have been satisfactory and judicious; in other words, Mr. HIGINBOTHAM and Sir JAMES CAMPBELL have met with approval.

The Committee do not recommend the Scotch method of staging bark; and they question the advantage of a portable saw-mill in Dean. The last-mentioned subject is reported on thus.

"A sawing-mill has been lately erected in the Forest of Dean, with a view of testing the propriety of establishing the same in other places. This must depend upon local circumstances: a portable sawing-mill can only be employed for timber of small scantling; and if intended for large timber, it would be difficult, on deep clay soils, to move the timber to the mill, which must then be a fixture. *As ship and boat builders are alone competent judges of what is best adapted for their own purposes, it would be wrong under any circumstances to attempt to convert crooked or knee timber.* The price of coals, the available extent of water power; the demand for staves, lathes, uprights or props for mines, &c., are also points to be considered, on which a person of practical and local knowledge is alone competent to give a sound opinion."

The sentence here put in italics will hardly elevate the committee in the eyes of the public. It was never proposed to compel buyers of timber to use the saw-mill in question; all that was proposed was to give them the opportunity of doing so in case they desired it; and, unless we are much misinformed, buyers did in fact eagerly avail themselves of it. We would also humbly submit to the Committee that since "ship and boat-builders are alone competent judges of what is best adapted for their own purposes," it would not be wrong *under any* circumstances to attempt to convert crooked or knee timber. Suppose they wished to convert it, why should they not? Their wish having been expressed, circumstances in which it would be desirable seem to us to arise.

The Committee say that "they consider it due to Mr. KENNEDY to state that, though his proceedings may be open to objection, he has evinced much zeal, energy, and vigilance in the execution of his office." Since the reward which he has received at the hands of the Treasury is dismissal from office, we learn unmistakeably how "zeal, energy, and vigilance" are valued in Downing Street.

The Committee go on to say:—"The division of responsibility between the Commissioners and the Treasury, established by the 14 & 15 Vict. c. 42, has not worked well. A surveyor-general of practical experience, the appointment of whom is provided for by the 12th section of the said Act, should have the superintendence of the whole of the forests, which he should frequently visit, and be responsible for carrying out all necessary details, through competent deputy surveyors under him. These deputy surveyors should also be practically acquainted with forest affairs, and the place of *deputy surveyors should not be given, as it sometimes has been, to persons wholly ignorant of the management of woodlands.*"

We trust that the last paragraph will not be forgotten. The committee entirely agree with the opinion we have so repeatedly expressed, and we hope to hear no more of the harshness with which we have spoken of appointments which the committee would no doubt have condemned in terms as strong as our own had the forms of Parliament permitted it.

When the evidence is printed we shall return to this subject, and shall then endeavour to discover whose information it is which has led the Committee to report that there is no timber in Hainault forest, which is now a place devoted to agriculture. We suspect that the dwellers therein will be as much surprised as ourselves at this declaration.

VEGETABLE PATHOLOGY.—No. XXX.

133. In some cases an extremely small quantity of light is quite sufficient to satisfy the necessary conditions. Humboldt has shown in his "Personal Narrative," that certain Algæ exhibit a green tint at the depth of many fathoms in the sea, where the degree of light is only $\frac{1}{1500}$ as intense as common daylight, and in "Uster's Annals,"* and the "Flora Friburgensis," he has stated, from his own experiments, in addition to many notorious facts, that plants raised in mines do sometimes acquire a green tint, and he therefore reasons that light cannot be regarded as the cause of the formation of chlorophyl, and that bleaching is due to the accumulation of oxygen.† The mines in which his experiments and observations were made abounded in hydrogen, and he conceives that the oxygen ceased in consequence to be accumulated, and that etiolation did not take place. Such plants are not always short-lived, but even produce perfect flowers, in those cases only (in all probability) where the plant is already well established and ready to blow, as in turf containing such plants as Poa annua, Trifolium arvense, Plantago lanceolata, &c., or where the flower is already formed within the bulb, as in the Crocus; though, however, the Crocus formed green leaves and flowered well, the whole plant perished on the 17th day after the bulb had been placed in the mine, a circumstance which might well be expected in an atmosphere so charged with hydrogen as to extinguish a candle and affect the lungs. When the abovementioned plants were introduced into the mine the blossoms expanded, and the fresh leaves were green, but dark at the tips and pale below. This difference of tint was not observable in Peas, which germinated in the galleries of the mine. Whichever theory be adopted, it is clear that the practical effect in questions relative to disease where pure atmospheric air is concerned, remains just the same. The green colour is not produced except the oxygen is eliminated; and whether the colouring be effected by the immediate agency of light or by the eliminated oxygen, is comparatively of little importance. As regards the green tint acquired by Algæ at depths where light is extremely faint, Dr. Harvey suggests, though with the confession that it is a mere supposition, "that perhaps what are called the chemical rays, in which seem to reside the most active principles of solar light, may be those which cause colour amongst vegetables, and these *may* penetrate to depths which luminous rays do not reach."

134. The intensity of light varies considerably in different countries, whereas at the Cape of Good Hope it is given by Herschel as 48.75, in England it is only from 25 to 30. In artificial culture it is, therefore, evident

* Usteri Annalen der Botanik, 1792, p. 236. Flora Friburgensis, 1793, p. 180.

† It is curious that Aristotle, in his treatise on colours, as quoted by Humboldt, says where water and light co-operate green is produced; where earth and water alone, white.

that plants which require such an intense light must be liable to disease in consequence of the comparative deficiency.

135. Light has a marked effect in altering the nature of surfaces in many cryptogamic plants. If, for instance, a Polyporus in full fruit be inverted, the hymenium is soon obliterated, and the former upper surface is converted into a true hymenium. Exactly the contrary effect takes place in Marchantia, the frond of which, if inverted, soon changes its character, the old upper surface giving out roots, and the lower acquiring stomata.

136. That chlorophyl is produced under the influence of light is certain, and it is probable that other secretions may be influenced by it. That they are so, indirectly at least, is clear, since those secretions are in proportion to the production of chlorophyl, or at least to the healthy elaboration of juice in the leaves, which does not take place if the chlorophyl is deficient. Some secretions, as for instance sugar, seemed to be formed most energetically in the absence of light, at least in some cases; but even in these cases "the matter out of which the sugar was obtained all derived its origin in the first instance from the leaves, when it was produced under the influence of light, air, and heat." (Lindl. Intr., v. 2, p. 305.)

137. As fungi are mostly lovers of shade, but few species present a green tint, and that rather metallic than vegetable, while on the contrary chlorophyl in the shape of gonidia is the characteristic distinction of Lichens, which delight to bask in the full sun. Many Algæ, again, especially those which are well exposed, are of a bright green, and abound in chlorophyl, as, for instance, Confervæ, and the curious Caulerpæ, most of which grow on exposed sandy shores. It is true that many Lichens cannot bear exposure, and that such species equally with the others produce gonidia. It is probable that modifications of the normal vegetable green do not depend so much upon light as upon other chemical agents, though aided probably by its greater or less intensity. Some kinds of fruit, though gathered nearly green, acquire their proper colour when kept in the shade, though the tint is not so deep as when they are exposed.

138. It is sometimes asserted that light is the agent by which inorganic matter is transformed into an organic compound; but no such transformation can take place without the pre-existence of a germ. It is very true that when water is exposed to light, green Algæ soon make their appearance; but it is no less true that the spores of fungi germinate much more readily in the shade. And, indeed, if the development of cells in phænogams be considered, we shall find that it is only those which immediately elaborate the chlorophyl on which the other secretions of the plant are more or less dependent, which grow the best when exposed to light. The tissues of the roots, which are intended principally to convey water, with the matter dissolved in it, from the soil, and which will perform this function the better the more delicate and pervious the tissues are, are developed best when removed from its influence, a fact confirmed by the greater rapidity with which roots are produced in Hyacinths, placed in water, when kept in the shade; and, indeed, where the deposit of woody fibre is the greatest, it is completely protected from the light by the thick bark, whereas the young shoots and many herbaceous plants suffer a considerable quantity of light to pass through their tissues. The first phenomenon of germination consists in the protrusion of the root with a view to collect water for the supply of the carbonic acid which may be mixed with it to the young plant; and as this process succeeds best in the shade, intense light is prejudicial in the first stages of germination, though no sooner have the cotyledons made their appearance than its agency is requisite to commence the fixation of the carbon and the elimination of oxygen, on which the vigour of the young plant depends. We have omitted any notice of the effects of the different coloured rays on vegetation, as, though matters of curiosity, they do not (except in the cases of greenish light) enter into the elements of the diseases of plants, so far at least as we are able to appreciate. *M. J. B.*

ON THE CULTIVATION OF PEAR TREES IN THE NEIGHBOURHOOD OF LONDON.

IT is evident to every foreign observer that the plantations of Pear trees in the neighbourhood of London are objects of great importance. They remark that extensive portions of ground are planted with these fruit trees, especially between Vauxhall station and Kingston, from thence to Isleworth, between Hammersmith and Brentford, and in going from Paddington to Reading. In all these plantations, the same system prevails as regards the choice of trees; and they all appear to be reared and cultivated uniformly in the same way. The trees, however, grow vigorously, which is a proof that the soil and climate are suitable to them.

Doubtless the soil in these localities, as well as the climate of England, is generally colder than in Belgium, which, also, is less favourably circumstanced in these respects than its neighbouring countries situated more to the south. On this account the planter should select only very hardy and vigorous sorts, which should be reared in a proper manner; and in order to obtain the desired result, the trees, moreover, should be skilfully pruned.

On several visits which we have made of late years to the plantations of Pear trees, above alluded to, we have observed that they were unproductive; and to what cause must this be attributed? This question is not only of great importance to the proprietor of the soil, but also to the tenant. We shall endeavour to solve it.

It is probable that in the choice of seeds for raising Pear stocks the preference is given, in England, to those from vigorous varieties. In proof of this the trees generally exhibit a strong growth. Instead of training the stocks with a straight upright stem for 8 or 10 years before grafting, at 7 feet from the ground, that is to say, at the part of the stock nearest to the fructification, the English cultivator grafts near the ground, and as far as possible from where the fruit is to be produced. The consequence is that the graft requires to grow for three or four years before it attains the necessary height of stem for a standard; and then another period of three or four years must elapse before a head can be formed to produce its first fruit. This is an error, and is contrary to all physiological principles applicable to the cultivation of fruit trees.

In fact, when we examine the bearing of Pear trees, trained with an upright stem, either as a pyramid or as a standard, we always find that the fruit shows itself first on the upper part of the plant. The age of the tree, the numerous sap vessels of the stem and branches exposed to the influence of the solar rays and free air, contribute to the formation of fruit-buds, and to the nourishment of the fruits which are subsequently produced. When we deprive the stock of these sap channels, in consequence of grafting low, or on stocks that are too young, we have long to wait before the trees come into bearing. This will be understood by every practical man who has paid attention to the subject.

There is another point to which attention ought to be directed. Some stocks exercise a certain influence on the graft; and the latter requires likewise to be judiciously selected. In grafting at standard height, it is necessary that the graft should be taken from a vigorous shoot in the upper part of a bearing tree, growing on the Pear stock. By using a graft taken from an overgrown shoot, or cut from a lateral branch of a tree not yet in bearing, fruitfulness is thereby delayed. If we employ grafts taken from a very old tree, diseased or weakened by bearing, or from a tree worked on the Quince stock, we impart to the tree resulting from such grafts all the characteristics of degeneracy and of premature decrepitude.

In all the plantations round London the standard Pear trees, instead of being trained with a straight, upright stem, exhibit, after seven or eight years of cultivation, a number of branches hanging and straggling in all directions, furnished with a mass of spurs disproportionate to the vigour of the trees. These flower abundantly every spring; but the fruits, from being slightly or imperfectly set, drop off. These disastrous results are attributed, in England, to the coldness of the soil and variableness of the climate; but we are of opinion that the fault is entirely owing to the mode of cultivation. Some call this English cultivation; but when it only gives unsatisfactory results, why persevere in it?

We have stated on what principles a tree ought to be reared; but in order that it may preserve sufficient vigour, and that it may be quickly brought into a bearing state, it is necessary that the roots, stem, branches, and shoots should be in due proportion to each other. To maintain the equilibrium amongst these, it is necessary that the tree should be subjected, from its youth until it comes into bearing, to a proper system of pruning. Afterwards its top will require to have the branches thinned, regulated, or occasionally shortened; and this care must be continued during the life of the tree. By keeping the spurs in good condition, and the tree clear from insects, it will be enabled to set and bring to maturity its fruit. It is scarcely necessary to add that this result cannot be obtained unless the ground is enriched with good manure, adapted to the nature of the soil. This holds good as regards all crops. There is another essential point to which we would call the attention of intelligent practical men.

In rearing a standard for the open ground, it is indispensably necessary to train the stem erect, straight, and tapering, so that all the sap ascending and descending by the stem may be distributed in the branches and shoots, placed at proper distances and at angles sufficiently open to admit the sun's rays to all the parts. It is also necessary that the stem be grafted from 6 to 7 feet above the ground, and that it is strong enough to support itself without a stake. We only place a small rod at the upper part, which is tied to the stem in two places; to this the graft is fastened for two consecutive years, in order to preserve it from being injured by the wind. During the summer of the third year after grafting, the leading shoot is still kept straight and upright by means of a small rod.

Disbudding must be attended to during the first three years after grafting, in order that the branches may be formed at proper distances. The operation should be commenced as soon as the grafts begin to push. Laterals should be pinched after midsummer. If these operations are duly performed, the winter pruning will be reduced to merely cutting back the shoots to a good eye. The tree will bear fruit in the third or fourth year, if grafted and reared according to the system we have indicated, and of trees managed according to it we could show a great number of specimens in our nurseries at Brussels.

We are of opinion that these operations belong to nurserymen; for those who have to make plantations of Pear trees will find it better to plant trees already formed as standards, and that have been grafted at least two years. If the trees be planted in November, the check from removal will tend to the formation of fruit-buds in the following season.

There are some new and very hardy varieties of Pears which have been raised from seed in Belgium within the last 25 years, and which are admirably adapted for standards. They will be specially noticed in an article which we are preparing. If any English amateur should rear a certain number of standard Pear trees, according to the preceding directions, and manage them on good principles, he may be assured they will bear abundantly; and then he will readily perceive the cause of unfruitfulness in the Pear plantations in the neighbourhood of London. *J. de Jonghe, Brussels, July* 19.

KALOSANTHES COCCINEA.

THIS and other varieties of Kalosanthes as bedding plants cannot be excelled either in beauty or the facility with which their cuttings are struck and brought into a flowering state. The immense and singularly compact heads of bloom that can be obtained from each comparatively small plant, in about nine months from the time the cuttings are put in, combined with their charming colour, render them among the most attractive plants in the parterre.

Any time about the end of September I take some strong healthy points of the growing shoots, and after forming them into cuttings 2½ inches in length, cutting close to a joint, and stripping the leaves from the bottom for about three-fourths of an inch, I lay them on the potting bench to dry for 24 hours. This is necessary, as from the extreme succulence of the plants they are apt to rot if put in at once.

Shallow pans or boxes four inches deep, and any convenient length and width, are prepared by putting in two inches of drainage, then a little moss or sphagnum, and over that some lumpy peat or loam, an inch deep; and then an inch of sandy loam, fine lime rubbish and sand, well mixed, and pressed closely down.

The cuttings should be put in about an inch, or an inch and a half apart, and a slight watering given to settle the soil around them. Place them in any frame or pit, or even in a greenhouse, close to the glass, and they will strike freely, and continue rooting all the winter. The tops will not grow much if kept near the glass, and plenty of air allowed them; nor is this desirable, as the dwarfer the plants are, the more novel and beautiful they look.

In March prepare some compost for potting them, by mixing three parts sandy loam, some fine lime rubbish, a very little leaf-mould, or lumpy peat and sand. Take the plants from the pans with little balls of soil, by raising them gently with the potting stick, and place them singly in 4-inch pots, well drained. Set them in a frame or pit, with their tops only 4 or 6 inches from the glass, and where the frost can be excluded, keeping the frame close for about a week or 10 days, after which they must be gradually inured to a circulation of air. Tilting the sashes at the sides, by placing the tilter between them and the rafter, will be found to answer better than sliding, or only tilting at the back. The object is to give strength without drawing the plants up, and, by keeping the glass close to their tops, to cause them to set flower-buds, which they will readily do under such treatment; and by planting out time, which with me is about the beginning of June, every plant, if well-managed, will have its head of bloom perfectly formed, and beginning to expand.

Kalosanthes look best planted in circular or oval beds, placing the tallest in the centre, and gradually descending to the edge; the last row should be placed in the ground a little deeper than the rest, and should slightly incline outward, in order to give a rounded appearance. Any good border soil seems to suit them, but if poor, some fresh loam and leaf soil should be added. I always water the plants well before turning them out of the pots, and the bed also, when necessary. Some green moss laid upon the surface of the bed gives it a neat appearance, and prevents evaporation. *Alpha.*

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVÉLIERE, NANTES.—BY HIMSELF.

(*Continued from p.* 469.)

Alexandrine Douillard.—Tree vigorous, and may be grown as a standard, or as a pyramid; the latter form is, however, most suitable for it. The fruit is handsome, of the size of a Beurré d'Amanlis; stalk long, skin yellowish grey, flesh fine, white, very juicy and sugary. Season, November and December. Raised from seed by M. Douillard, architect, Nantes; and fruited for the first time in 1849.

Duc de Brabant.—Tree vigorous and productive; may be grown either as a standard or as a pyramid. Fruit large, about 3¾ inches in length and 6 inches in circumference at the widest part, of a pyriform shape, tapering much towards the stalk; the latter is about 1⅛ inch in length, slightly curved; eye open, in a slight depression; skin smooth, pale green, dotted and speckled with brown, and acquiring a somewhat yellowish tinge as the fruit approaches maturity, which it usually attains in October and November. This is one of Van Mons' seedlings, and is supposed to have been first fruited in 1827.

Willermoz.—The tree makes a fine growth, and quickly forms a handsome pyramid. Fruit large, pyriform. Stalk short. Eye open, in a small cavity, surrounded with some folds. Skin smooth, pale green, yellowish when the fruit is ripe, tinged with red, and finely marked with yellowish brown dots. Flesh white, fine, melting, juicy,

sugary, with a slight musky perfume. Season, October and November. Obtained by M. Bivort, and named by him in compliment to M. Willermoz.

Henri Bivort.—The tree grows with excessive vigour on the Pear stock; less so, of course, on the Quince. It pushes so strongly that it is more advantageous to propagate it by grafting rather than by budding. Fruit 3½ inches in length, and nearly as much in diameter; obtuse-pyramidal. Stalk from 1 to 1½ inch in length, oblique. Eye open, irregular, in a slight depression. Skin smooth, pale green, speckled with brown. Flesh yellowish white, fine, half buttery, very juicy and melting, with a perfumed flavour. Ripens in the first fortnight of September. Raised by M. A. Bivort.

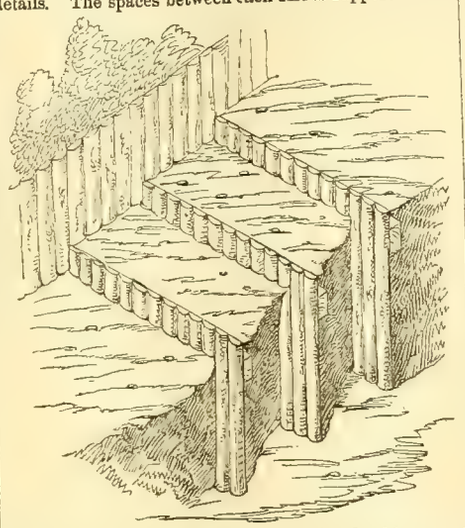
Beurré Benner.—The tree assumes a handsome pyramidal form, suitable for a standard. Fruit small, turbinate; stalk about an inch in length, thick; eye open in an irregularly formed knobby cavity; skin smooth, yellow, strongly marked with streaks and patches of reddish brown next the sun; flesh melting, fine, buttery, with abundance of sugary perfumed juice. Season January and February. Obtained by M. Bivort, and fruited for the first time in 1846. ||

Home Correspondence.

Hardiness.—I should be glad to learn whether Philesia buxifolia stands the winter and spring in the ordinary parts of England. Also the same as to Rhodoleia; and if so, whether its hardiness is rendered useless, like that of the Camellia, by precocious blossoming. Thirdly, whether the statements concerning Clerodendron fœtidum and the closely allied species being hardy are believed by you. *A. H.* [Rhodoleia is certainly tender. Philesia and Clerodendrons are probably hardy, but we have no personal experience on the subject.]

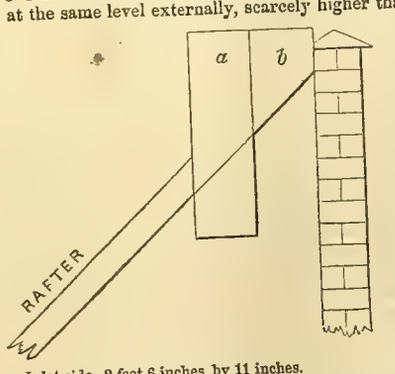
Enville Hall Gardens.—For 25 years I have been in the habit of annually visiting many of the gardens in England, and can bear testimony to the vast improvement that has steadily progressed during that time. Some places have sustained a well-earned fame for beauty for many years; others have had wide-spread names, but little deserved them, except in one or two particulars—such was the case with Enville, the seat of the Earl of Stamford and Warrington; it had long borne an honoured name, on account of its beautifully undulated lawns, and for its plantations having been judiciously arranged by the poet Shenston; through the persevering liberality of the present Earl, however, and that liberality guided by good taste and an innate love of all that is beautiful, it may now take a high rank among our best places, for all that makes a garden admirable and enjoyable. Most of the best places in England have been the work of many years, their noble owners from generation to generation have spent large sums of money upon their improvement and enlargement, but little or nothing was done for Enville till seven years ago, when the present Earl commenced adding to the small lawn, which was called, *par excellence*, "the gardens," and the four acres of olden days are now fast growing into 60. Coniferous plants of the best sorts have been largely introduced, and are growing well. Rhododendrons and other evergreens luxuriate in the natural soil (a gravelly loam), and most of the old trees, and especially Limes and copper-coloured Beeches, are fine specimens. The flowers (all good) are arranged in round beds, and in "ribbons" along the borders. I noticed two beds of Geraniums, Mountain of Light, each containing above 150 plants, and about 800 Golden Chain, forming the front rank of one of those pretty rows of various colours, which are so ornamental, especially when disposed in curves. I now, however, come to the great features of the place, the magnificent fountains just finished. It is a common saying, that "comparisons are odious," but the proverb does not always stand good, for there is nothing odious in comparing one thing that is admirable with another of acknowledged excellence. I have therefore no hesitation in saying that the large jet at Enville will stand comparison with that at Chatsworth, and that the "Triton and River Horse" fountain is superior to anything of the kind in the kingdom. The large jet is placed in a pool at the higher part of the pleasure grounds, backed by a hanging wood of fine old Oaks. The "River Horse" fountain is in a pool immediately below, fringed with Rhododendrons and Weeping Willows. The ground on each side gradually slopes to the water's edge, and flower-beds are introduced at intervals. I stood in a position from which I could see both fountains playing at the same time. The day was glorious, the sun unclouded, and but little wind stirring. Words fail to convey a correct idea of the beauty of the scene. There were 16 jets throwing water to a height of 40 feet from beautifully-modelled horses, and the triton discharged a stream full 70 feet high. Thirty-five feet above was the large jet, emitting far more than 1000 gallons per minute to the height of 200 feet. These grand results have been effected at the expense of a large outlay; for all the water has to be pumped up to the reservoir by two thirty-horse power steam-engines, through half a mile of 15-inch pipes, and it descends from the reservoir (nearly 300 feet above the jet), through the same distance of piping without a check, there not being a bend in the whole length. The works were commenced in the spring of last year; there was a large pool made on the gathering grounds, and the reservoir formed on the top of the hill; an enormous weight of piping has been laid, the engines and all other necessary things fixed, and the fountains were at work on the 10th of July, 1854. "Let honour be given to whom honour is due." It would be an insult to the noble proprietor who conceived and has caused these great works to be carried out, to bespatter him with fulsome praise; all I can say is, let those who can go and see Enville, for he kindly allows all, without distinction, to inspect his lovely place on Tuesdays and Thursdays, and I am quite sure that it will require no selected individual to give the key note to the thousands who will honour his spirit and liberality. *From a Correspondent.*

Rustic Steps.—The kind of steps of which I annex a sketch will be found useful and appropriate in many situations. One great advantage they possess is their simplicity of construction. Any rough carpenter with the assistance of a labourer can manage them very well. The isometrical sketch will, I think, explain their details. The spaces between each rise is supposed to be



filled in with the ordinary soil, and faced with gravel like the walk of which they are but continuations. I have, however, seen the gravel replaced by hexagonal wooden blocks, and they answer very well. The readiest and least expensive way to make them is to get a few poles sawn into the requisite shape, and then cut them into pieces of sufficient length to imbed firmly in the soil, fitting them together like paving tiles. *Crayon.*

Aëration.—I now send as concise and exact a description as I can of the ventilator I have used in my plant-house for these last seven months. It is made of deal boards—as long as one sash is wide, say 3 feet 3 inches; call this the length of the box. The inlet part is 2 feet 6 inches high and 11 inches wide; the outlet part follows the slant of the rafter, and close to the inlet side is 1 foot 6 inches high, coming off as the rafter lies to 1 foot at the extreme back, nearest the back wall. The outlet part does not hang down in the interior of the house at all, but the inlet part hangs down this difference of 1 foot between the 2 feet 6 inches of the inlet, and the 1 foot 6 inches of the outlet. The outlet part is 13 inches wide, and the same length as the inlet, 3 feet 3 inches. Both tubes stand out of the house at the same level externally, scarcely higher than



a Inlet side, 2 feet 6 inches by 11 inches.
b Outlet side, 1 foot 6 inches and 1 foot by 13 inches.

the coping of the back wall. This arrangement of the two parts of the ventilator answered perfectly through the winter months; but for summer ventilation the parts had better be reversed, and the inlet side turned to the back wall, and lengthened, so as to make it still 1 foot deeper than the lowest part of the outlet. My reason for proposing this alteration is, that as the house is supposed to face the south, as the sun gains strength, in the first arrangement of the parts of the ventilator, he warms that side of the box which it is desirable to keep as cool as possible, and therefore that side had better be placed to the north. This will slightly increase the expense, because it will take more material in its construction. In a span-roofed house I would place the inlet between two outlets. There can be no objection to making the inlet side come down in the house as low as may be considered desirable, if expense is no consideration. But it is as well to think beforehand whether the gain is in proportion; as in any apparatus, the parts when fixed cannot adapt themselves to any change that may take place. The ventilating power resides in the difference of temperatures and heights of these inlet and outlet columns of air; and does not change in the direct proportion of these differences and heights, but in the proportion of the square roots of those dimensions; therefore if a certain height, at a certain given temperature, produces any given amount of ventilation, to double that amount, we must multiply the depth of the inlet side by 4; for three times the effect by 9, and so on. Therefore it is very much cheaper, and would be found more effectual, to increase the number of these ventilators than to try to make one do all the work; to say nothing of the unsightly appearance of a great tube 9 or 16 feet long hanging down where plants should be. Nor would it do to elevate these tubes very much above the house, as the changes of the external temperature would act against the efficiency of one or other of the air-channels; and, besides these considerations, by increasing their number or making them continuous the whole length of the house, an ornamental appearance may be given. The foregoing reasoning also applies to the temperature, as affecting the rate of ventilation. If, with a certain given height or depth of column, a known rate is produced by some given difference of temperature, this difference must be fourfold for the rate to be doubled, ninefold for it to be trebled, &c. But the temperature must not be allowed to vary in anything like these proportions; thus furnishing additional reasons for multiplying the number of these ventilating columns, and confirming the correctness of my insisting that one foot difference in height between the columns is sufficient. One word as to the novelty of this "system," as "H. A." terms it. I know it is not new, and the application of it to plant-houses may not be new; nor is it entirely my own, I owe to another the idea; but I believe it is new to very many of your readres. I gave the rule for ascertaining the rate of motion in these air-channels in a previous communication, and need not repeat it here. *J. P. S., Chesterford.*

The Potato Crop.—As yet (July 22d) we have fortunately no disease. About a fortnight ago, when the weather was humid and sunless, we heard of spotted leaves, and here and there a diseased tuber and some infected foliage was even sent us, but by this time we trust that the bright sunny weather will have stopped it, and that the tubers will be safe. In Essex, where most people have planted early dwarf kinds, they are now fast ripening with a healthy yellow hue, and bidding defiance to disease, and none are in danger here except late varieties; by adherence to dwarf early sorts and early planting we hope to be able in future to say "Good bye to the Potato disease." Of about 10 selected varieties we cultivate, all are ripening free from taint. We are also equally successful this season in raising sound early varieties from seed (not tubers) a feat which has hitherto baffled us. It is a remarkable fact that this year such crops as are most susceptible of blight, louse, and numerous other insects, are, with the exception of the Bean and Hop, and a few others, comparatively free from those pests now so prevalent. We may instance the ill-fated Potato, the Pea, and the Cabbage, with some others. *A. Hardy and Son, Maldon.*

Preservation of Plant Sticks.—One frequent complaint I have heard made by exhibitors is, that the constant tying and untying of plants, rendered necessary by the rotting of the sticks in pots, takes up much time, and gives much additional trouble. I myself have experienced this, and, consequently, was induced to try some experiments as to the best means of preserving the sticks. Having tried various preparations, a solution of gutta percha among the number, I find what painters call knot-varnish (or what they put on knots before painting the wood) to be by far the best; even some small sticks, not so thick as an ordinary penholder, have, after 12 months' use, appeared as sound as on the day they were put in. I simply dip the stick into a bottle of the varnish, and let it drain off. I think, on further trial, it will be found to bear out the above statement. The sticks, of course, when dry can be painted any colour required; perhaps, however, some of your readers may know of something even better than this; if so, I hope they will favour me with their experience in the matter. *S. E. C., Cheltenham.*

Gooseberry Caterpillars.—In 1834 my fruit and Rose bushes being in a bad state through these pests, after all other remedies had failed I got 2 bushels of unslacked North Sunderland lime shells (no other kind will do, as I afterwards proved). I slacked two-thirds of the lime in the evening, and put the remainder in a dry place, to be used afterwards if necessary. Early next morning, while the dew was upon the bushes, I turned over the lime, adding a little more water if not thoroughly powdered, and with a slater's harling trowel or small shovel I dashed the hot lime in small quantities on the lower parts of the bushes infested as far up as the vermin were. The lime must be poured hot, or it will not kill the caterpillars, and if used in moderation it will not hurt the foliage or the fruit in the least. *R. W. H., Morningside, near Edinburgh.*

Societies.

HORTICULTURAL, *July* 25.—General Fox in the chair. J. Cunningham, Esq., Macedon, near Belfast, was elected a Fellow. Among subjects of exhibition was a collection of vegetables contributed by Mr. Smith, gr. to Mrs. Reay, of Little Blake Hall, Wanstead, to whom a Knightian Medal was awarded. Messrs. Veitch produced a cut specimen in a pot of Desfontainia spinosa, a new evergreen shrub from Patagonia, the general appearance of which, with the exception of the long

scarlet tubular flowers tipped with yellow with which it is furnished, is exactly that of the common Holly. It is expected to be hardy, but of that there has not yet been time enough for direct proof. Of Orchids, Mr. Dunsford, of Chingford, sent a newly imported plant of the yellow Cattleya citrina. Mr. Keele, gr. to J. Buller, Esq., of Woolwich, had Lissochilus speciosus, a terrestrial species from Southern Africa, bearing a long upright spike of yellow flowers. It is a well known plant, introduced very many years ago; but it has been lately brought forward as something new. Mr. Williams, gr. to C. B. Warner, Esq., contributed a cut specimen of Schomburgkia Lyonsi, a handsome species, described in our last volume, p. 615. From R. S. Yates, Esq., of Manchester, came a specimen of the handsome Chinese Renanthera coccinea, beautifully in flower, a rare occurrence in this country. In China, however, it is found to blossom with certainty and in the greatest profusion, scrambling over the walls of the factory at Macao, and covering them magnificently with its glorious inflorescence. A Certificate of Merit was awarded it. Of Pine Apples there were some extremely excellent fruit. Mr. Jones, gr. to Lady Charlotte Guest, sent two Ripley Queens, beautifully grown, and weighing respectively 6 lbs. 12 oz. and 5 lbs. 2 oz.; also a Providence, 10 lbs. 2 oz., and an Otaheite, 6 lbs. 4 oz., the four fruit making in all 28 lbs. 4 oz.! The heaviest Queen was stated to be only 3 oz. lighter than the finest fruit of the kind ever exhibited to the Society. A Knightian Medal was awarded. Two Queens, each 4 lbs. 5 oz. and 4 lbs. 4 oz., and a Providence, 7 lbs. 10 oz., came from Mr. Joy, gr. to Mrs. Colston, to whom a Banksian Medal was awarded. A similar award was also made to Mr. Davies, gr. to J. Dixon, Esq., of Astle Park, near Knutsford, for a Providence Pine weighing 9 lbs., and for a boxful of large and fine fruit of the Royal George Peach. Mr. Chapman, gr. to J. B. Glegg, Esq., produced six well ripened Stanwick Nectarines. Mr. Chapman, like other growers of this fruit, has found that it is late, and requires more heat than most sorts to bring it to perfection; but that when thoroughly well ripened in a high temperature, it fully maintains all that has been said respecting its remarkable excellence. A Certificate of Merit was awarded to it. The same grower also sent a fruit of his hybrid green-fleshed Melon, whose merits are now tolerably well known. Of Grapes, Mr. Carpenter, of Ban Hall Gardens, near Birmingham, had a small bunch of a white sort, said to be a seedling from the Black Hamburgh, and which it resembled very much except in colour. Mr. Cuthill furnished a dish of his Prince of Wales Strawberry, a good looking late kind. Mr. Wrench again showed a few fruit of Myatt's Pine-apple, the best flavoured of all Strawberries; but of late years it has become so unproductive that it has all but disappeared. Mr. Wrench stated that "it grows very well with him, but that it fruits most shyly." Mr. Kinghorn, St. Margaret's, Isleworth, produced what is very seldom seen in this country, fruit of Prunus dasycarpa, or Black Apricot, a species different from the common Apricot, and certainly unworthy of cultivation with us, except as a matter of curiosity. Its size and appearance are more those of a small deep red coloured Plum than an Apricot. The fruit in question was tolerably well flavoured; but in general it is too acid to be agreeable. A Certificate of Merit was awarded. The same grower also sent a dish of what was called St. Margaret's Cherry, a large and handsome black kind, apparently not different from the Circassian. From M. Decaisne, of the Jardin des Plantes at Paris, came two plants of the highly interesting Chinese Yam (Dioscorea Batatas), described in a leading article last week, as a probable substitute for the Potato. From the size of the set from which one of them had sprung it was evident that the tubers have the requisite of sufficient magnitude for profitable cultivation. We believe that M. Decaisne is fully justified in declaring that this plant at least is *pleine d'avenir*. They have been sent to the Society's garden for trial, the result of which will be duly reported. A Large Silver Medal was awarded it. From the Garden of the Society came Platycodon sinense, a greenhouse plant not inferior to the Russell Lisianth in colour and far more cultivable; a white form, new to gardens, of the well-known biennial Trachelium cæruleum, Exostema aquaticum, four varieties of Achimenes, Lobelia ramosa, the beautiful Myosotis azorica, Erica erubescens, and a hybrid Begonia, a bad cross between B. cinnabarina and B. heracleifolia. The garden also supplied a collection of vegetables, consisting of Auvergne, Ne Plus Ultra, and Fairbeard's Champion of England Peas, two kinds of Lettuces, Vanack Cabbage, Courge concourzelle, an extremely good kind of Vegetable Marrow, Orange Jelly Turnip, doubtless the best in cultivation, both as regards uniformity of shape and excellence, and it does not readily run to seed; early Six-weeks Turnip, two kinds of Kohl Rabi, and a specimen of Ægilopean Wheat, to which so much interest attaches, and concerning which so much was written in our volume for 1852. The produce of the seeds furnished by M. Fabre (who, it will be remembered, followed up the experiment of sowing the miserable Grass Ægilops ovata year after year till it became Wheat), raised in the garden this year, is in no respect different from the common hard Wheat of the South of France. From the garden likewise came fruit of Denniston's Superb Plum, from the orchard house; and Myatt's Eleanor, and white and red Alpine Strawberries.

CALEDONIAN HORTICULTURAL. — An extra summer competition was held on the 8th of July, when prizes were awarded as follows: 1st, for Greenhouse Plants, Mr. Reid, Millbank, with Phænocoma proliferum and Statice Holfordi; 2d, Mr. Lockhart, Arniston, with Tetratheca verticillata and Aphelexis humilis. Best dark Fuchsia: 1st, Mr. Mitchell, Ravelston, with Banks' Glory; 2d, Mr. Walker, Rosehall, with Sir J. Falstaff. Best light ditto: 1st, Mr. Mitchell, with Diadem of Flora; 2d, Mr. Crombie, Cramond House, with Pearl of England. Best Achimenes, Mr. Crocket, Raith. Best Cape Heaths: 1st, Mr. Lockhart, with a very tall plant of Erica spuria, and a neat well flowered specimen of Beaumontiana; 2d, Mr. Reid, with Ventricosa Bothwelliana and inflata alba; 3d, Mr. Smith, Melville Castle, with Cavendishi and Savilleana. Pinks (cut blooms): 1st, Mr. Reid, Broomfield, with Harriet, Surpriser, Lola Montes, Rubens, Berkshire Hero, Whipperin, Laura, Brilliant, Young's XX, Lord Valentia, Sharp's Splendid, and the Hon. Mrs. Herbert. Phloxes: 1st, Mr. Thomson, Lasswade, with Antagonist, Eyebright, Abd-el-Medschid Khan, and Chamouni; 2d, Mr. Smith, Clermiston, with Antagonist, Chamouni, and Baron Addisward. Pelargoniums in 8-inch pots: 1st, Mr. Forest, Glentarkie, with finely bloomed plants of Conspicuum, Norah, and Forget-me-not; 2d, Mr. Henderson, Cargilfield, with Gulielmus, Beauty of Montpelier, and Falstaff; 3d, Mr. Cameron, Trinity College, with Emily, Beauty of Montpelier, and Magnificum. Fancy kinds: 1st, Mr. Forrest, with Princess Maria, Delicatum, and Countess of Ross; 2d, Mr. Cameron, with Mignon, Annette, and Prima donna. Honorary award to Mr. Pender, of Moredun, for a dish of Keens' Seedling Strawberry. Messrs. P. Lawson & Son's Guinea, offered for the best 24 cut Roses, was awarded to Mr. Buist, Tynningham, for Géant des Batailles, Comte de Bourmont, La Reine, Eliza Mercier, William Jesse, Chénédolé, Dr. Juillard, Pius IX., Coupe d'Hébe, Count Montalivet, Adela Prévost, Louise Peronne, General Kleber, La Superbe, Robin Hood, Madame Fremion, Reine des Fleurs, General Changarnier, Leon de Guay, Charles Duval, Paul Ricaut, Boule de Nanteuil, Baronne Hallez, and Mrs. Elliot. A second premium was voted (by the Society) to Mr. Edwards, Lauriston Castle, for Charles Duval, Boule de Nanteuil, William Griffiths, Bernard Palissy, Nina, Lady F. Waldegrave, Augustine Mouchelet, Baronne Prevost, Robin Hood, Coupe d'Hébe, Géant des Batailles, General Changarnier, General Jacqueminot, Columella, Leonora, William Jesse, Madame Bosanquet, Eugène Barbet, Beauty of Billiard, Duchess of Sutherland, Shakespeare, Mrs. Elliot, La Ville de Bruxelles, and Chénédolé. The Guinea, offered by G. Patton, Esq., to Cottagers, for the best three cut Roses, was gained by Mr. Fargie, Newbattle, with Géant des Batailles, Baronne Prevost, and Laure Davoust. From the Nurseries of Messrs. Dickson & Co. were Tropæolum edule and other plants, with a box of Seedling Pansies, and one of named varieties, Pinks, Pelargoniums, &c.; from Messrs. Dickson & Sons, Cissus discolor, Lilium eximium, and Rose blooms; from Messrs. P. Lawson & Son, Gloxinia Digitalis erecta, Diplacus Californicus, stands of Roses, with blooms of their new Hybrid Bourbon, named "Charles Lawson"—also plants of Wellingtonia gigantea, and a Californian Conifer, labelled "Cupressus sp.," much resembling Wellingtonia in its young state; from Mrs. Carstairs, Fancy Pelargoniums, Calceolarias, and Rose blooms; from Mr. Handasyde, Roses; from Mr. Stark, Roses, Pansies, and Delphiniums; from Mr. Methven, Pelargoniums; and from Messrs. Young and Mackay, a flowering plant of Ipomœa quamoclit. From Lady Keith, Fuchsias; from Mrs. Fraser, Oncidium pulvinatum, for which an honorary award was voted, also Ferns and Alpine plants; from Sir W. Gibson Craig, Bart., several new Californian plants, including Horkelia congesta and Eriogonum Californicum in flower; from S. Hay, Esq., Pelargoniums; from Professor Syme, Statice puberula; from C. K. Sivewright, Esq., Pelargoniums; from W. Hunt, Esq., promising Seedling Gloxinias; from the garden of J. Cameron, Esq., a large and fine specimen of Clerodendron Kæmpferi, and several Cockscombs; from W. A. Pringle, Esq., Roses; and from J. Mood, Esq., Fuchsias. The day being fine there was a large attendance.

Reviews.

The Intimate Structure and Vital Functions of Cells.—(Die Pflanzenzelle, der innere Bau und das Leben der Gewächse.) Von Dr. H. Schacht. 8vo, pp. xvi. and 470; tab. xx. Berlin, 1852.

It would be difficult to point out a more important book to the physiological botanist than that whose title we have just given. It abounds with matter derived from various sources and original observations, and is accompanied by illustrations, which, with a few solitary exceptions, leave little or nothing to be desired.*

Every organ is separately considered—historically, anatomically, and functionally—and, for the most part, every possible degree of information pointed out; where any deficiency in this respect exists, the defect arises from a less frequent consultation of foreign than of German authorities;† and, in a few instances, we have noticed a tendency to generalise from partial observations. It would be easy to give extracts of more than sufficient interest to justify us in occupying a more considerable space than is usually devoted in our pages to reviews, and we have indeed already given a large extract from the portion which treats on vital phenomena.

We shall, however, take occasion to reproduce another tolerably long passage, because of its great utility, for we do not know where to find a full statement elsewhere in so practical a form of the effect of chemical reagents on the component parts of vegetable structures. We must, however, confine ourselves to that portion which treats of the cell walls themselves and their proteinous contents, without adverting to the matter contained in the protoplasm, such as starch, chlorophyl, inuline, crystals, &c. The matter is of the greatest importance as regards multitudes of questions of vegetable physiology, and affords quite a new field of elegant and profitable recreation for those who are moderately skilful in the use of the microscope. The beauty of some objects, such as the delicate appendages of Riccia natans, under the application of such reagents, is almost inconceivable.

In order to obtain any satisfactory result from the use of chemical reagents under the microscope, it is absolutely necessary to be acquainted intimately with the actions of these substances on the different fundamental chemical productions of plants. Unfortunately, all of these productions, at least under existent methods of analysis, are not capable of being perfectly separated from others, or of being procured in sufficient quantity to admit of their chemical examination. We are, therefore, obliged to be contented with the cursory observation of the reaction of chemical tests under the microscope.

The following may be distinguished as decidedly different products:—

1. *Cellulose* is characterised by its solubility in concentrated sulphuric acid, while it is insoluble in caustic potash. It is, besides, in many cases rendered blue by a solution of iodine* and chloride of zinc; iodine and sulphuric acid produce the same tint more readily, but there are modifications of cellulose which do not become blue when treated with either of these substances. Iodine imparts to cellulose a light yellow tint; sugar and sulphuric acid have no effect upon it. According to Schulze it is dissolved by maceration; the more delicate parts of the cell walls, which consist of cellulose, are naturally acted upon more rapidly than the stronger incrassated portion; in consequence, a macerated cell often exhibits real apertures, while merely attenuated spots arise in the same kind of cells insolated by potash. Potash produces a slight swelling of the cellulose. Cellulose appears on the one side to pass into starch, or into a substance resembling starch, on the other to be changed both into xylogen and cork. Cellulose forms the fundamental substance of the primary cell-wall, and of the lining strata; the wall of all young cells is composed entirely of it; cellulose, however, is subject to many modifications, which are indicated by the different shades of colour produced by a solution of iodine and chloride of zinc, and combined iodine and sulphuric acid. The charcoal of pure cellulose appears, according to the latest observations of F. Schulze (Tagblatt der xxviii Naturforscher—Sammlung, p. 13. Gotha, Sep. 20, 51), to be, like the diamond, colourless, and translucent under the microscope. The chemical analyses of cellulose present the following composition:—

	Payen.	Fromberg and Bauhauer.	Mitscherlich.
C.	12	24	12
H.	20	42	20
O.	10	21	10

2. *Xylogen*, or wood-forming matter, has exactly opposite qualities to those of cellulose; concentrated sulphuric acid has little or no effect on it, caustic potash dissolves it readily and completely; a solution of iodine and chloride of zinc, and combined iodine and sulphuric acid, produce no blue tint; iodine as well as sugar and sulphuric acid, are equally indifferent; boiled with chlorate of potash and nitric acid, according to Schulze, it is dissolved. Xylogen is deposited in the primary cell wall and in the lining strata of all lignified cells, producing firmness of the cell wall, and preventing the reaction of the accompanying cellulose on iodine and sulphuric acid. Xylogen is probably a metamorphic production of cellulose; no chemical analysis exists.

3. *Cuticular matter* or *cork* is acted upon by sulphuric acid and caustic potash in the same manner as xylogen; sulphuric acid does not dissolve it, caustic potash dissolves it readily; it is, however, distinguished from xylogen essentially by its relation to oxidising matters; boiled with chlorate of potash and nitric acid it is not dissolved, but changed into a tough resinous substance, which is soluble in ether and alcohol; it burns in a platinum capsule with a light smoky flame, diffusing a faint aromatic odour, and leaves a porous charcoal. Cuticular matter is found in the walls of old cork cells, which often consist entirely of this substance, and in the cuticular layers of the epidermis; like xylogen, it prevents the reaction of iodine and sulphuric acid on the cellulose by which it is accompanied; it seems to be a metamorphic product of cellulose, since, with the increase of cuticular matter, it gradually decreases, and at length entirely vanishes. Mitscherlich found in 100 parts of the cork of Quercus Suber—C., 65.73; H., 8.33; O., 24.54; and N., 1.50.

4. *Intercellular substance* has the same reaction as xylogen. It is insoluble, or nearly so, in sulphuric

* The least satisfactory is the analysis of the Truffle, which will not bear comparison for a moment with that of Tulasne.

† As an instance, we may give the assertion that spiral vessels are seldom branched (see p. 194). We might point out Turpin's paper on Biforines, Solly's papers in the Transactions of the Society of Arts, and Trécul's Memoirs, as indicative of their being frequently branched, especially in Endogenous plants.

* The solution of iodine recommended by Schacht in his work on Flax and Cotton consists of 1 gr. iodine, 2 gr. iodide of potassium, and 1 oz. distilled water.

acid, while caustic potash dissolves it more or less speedily. Iodine with sulphuric acid, as also a solution of iodine and chloride of zinc, do not communicate a blue tint. Intercellular substance, like cellulose, seems to undergo many modifications, as appears by the degree of its solubility in sulphuric acid; and the intercellular substance of some fungi, lichens, and algæ is dissolved by boiling in water.

5. The true *cuticle* is identical with the intercellular substance, and, as it seems, is only slightly modified, as regards colour and character, by the effect of air; it is soluble in caustic potash, and is not affected by concentrated sulphuric acid; the cuticle of pileate fungi is soluble in water. The intercellular substance, as well as the cuticle, are secretions from the cell-wall; neither contains cellulose—but both are more nearly allied to xylogen than cuticular matter, since both are dissolved, according to Schulze, by maceration. There is no existing analysis.

6. The proteinous matters of cells are not dissolved by concentrated sulphuric acid; but, on the contrary, are affected by caustic potash; iodine and sulphuric acid give them a golden-yellow tint; a solution of iodine and chloride of zinc produces a contraction or curdling. A solution of iodine, as also nitric acid and ammonia, imparts a deep yellow tint. Muriatic acid produces in 24 hours a violet tint, sugar and sulphuric acid in 10 minutes a beautiful rose red. The proteinous matter penetrates with other substances into the cell walls. Protein, according to Mulder, consists of C_{40}, N_{10}, H_{62}, O_{12}.

Most willingly should we extend our extracts, but want of space compels us to close our notice. The work will probably be given to the public in an English form, the only impediment being the attendant expence, and the necessity of its translation being undertaken by some thoroughly competent person. We could easily point out two nearly contemporaneous translations of the same memoir, which in a multitude of minute points differ materially from each other, the one proceeding from a person perfectly conversant with the original language, but unacquainted with the subject, while the other laboured under no such disadvantage. The author's work on the microscope has had full justice done it by its talented translator, who would, however, have done well to leave out some of its platitudes and truisms; and we trust that this equally, or even more, important treatise may meet with similar good fortune.

Botany of the Antarctic Voyage. Flora of New Zealand, Part 6.—This new part of Dr. Hooker's great work is entirely occupied by details of cryptogamic botany. The plates are filled with beautiful figures of Mosses, Jungermannias, Fungi, and Seaweeds.

The Botany of the Herald has reached a 5th number, which contains all the orders intervening before Peppers, and admirable plates to illustrate the unpublished text. The figure of the Ivory Nut Palm is one of the happiest instances of Mr. Fitch's successful pencil. Among other pieces of useful information, Dr. Seeman informs us that the frankincense used in the churches of Veraguas is obtained from a kind of Styrax—S. punctatum; that some Schultesias furnish the Gentian of Panama, called Canchalagua; that the very hard timber called Guayacan in Panama is furnished by a Bignoniaceous plant called Tecoma Guayacan; and that a Pepper called Ottonia glaucescens is used in Darien for stupefying fish. The present number of Dr. Seeman's work also contains his general observations upon the race of Calabashes or Crescentiads.

Garden Memoranda.

Northend House, Twickenham, the residence of Mr. Henry Bohn, the well-known publisher.—A brilliant Rose fête took place here a week or two ago, at which between 300 and 400 of the nobility and gentry attended. The Roses, of which Mr. Bohn possesses a very large and excellent collection, were then just in perfection, and being chiefly standards, furnished with clean stems and charming heads of flowers, they made an admirable display. Among new kinds was General Jacqueminot (H. P.), a capital acquisition, with a colour equal to that of Standard of Marengo. On the lawn, which is fringed with flower beds, were some very fine pillar Roses, which, when skilfully introduced, have a striking effect. A few of the beds are what is termed "mixed;" others are "masses." The former contained a fine collection of different kinds of Lilies in bloom. Some of the circular masses consisted of variegated Geraniums, intersected by stripes of Mountain of Light, which run through them and round their edges, and served to enhance their beauty considerably. Stocks, scarlet Kalosanths, and similar gay plants in other beds, all served to make a brilliant display, which by means of late flowering Roses, Fuchsias, Japan Lilies, scarlet Geraniums, Calceolarias, and other plants will be well sustained all through the autumn.

The lawn is cut off from the kitchen and fruit gardens partly by a belt of lofty trees and shrubs, in the midst of which is a winding walk, and partly by a wall covered with climbers and other plants. The fruit department, which is entered through a handsome iron gate, comprises about six acres thickly planted with bush and other fruits, and presents a fair crop of most things, especially of Morello Cherries on standards. Broad gravel walks traverse this ground in various directions, all of them bordered with standard Roses, Conifers, Rhododendrons, Kalmias, and other choice and valuable plants. Among the Conifers were Funeral Cypress, Fitz-Roya patagonica, and Saxe-Gothæa conspicua, both the two last named plants about 8 feet in height; Pinus Nordmanniana, which has wintered safely, as have also Libocedrus chilensis, and Deodars, which have not even been touched either by winter or spring frosts. Pinus insignis was hurt; but has recovered. A Cryptomeria, 10 feet high, lost four feet off its top, while another of less height, and a little sheltered, escaped. We also remarked some charming specimens of the Golden Thuja. Some of the smaller Conifers are growing out of round patches of Stonecrop, which is very plentiful. Specimens here and there of Irish Yew had Golden Yew worked on their tops, which made them look as if they bore great panicles of bright yellow inflorescence. Deutzia gracilis, both dwarfs and standards, was planted out, and doing well; of Dielytra there are many very large masses here, which wintered well, but were cut down completely by the April frost. They have, however, pushed again freely, and will probably flower in the autumn. The various Sikkim Rhododendrons, of which there are here nearly every variety, have been plunged in the open border to harden and ripen their wood.

On the lawn near the house is a fine old Catalpa, and we also remarked an example of the seldom seen Maidenhair tree (Salisburia adiantifolia).

In another part of the grounds, a half-sunk pit, with a ridge and furrow roof, has been converted into an elegant greenhouse. It has a circular pane of glass in one of the sides 3 feet in diameter, which greatly relieves the heavy look of the brickwork; and a sloping square pane of plate glass forms one of the ends. This pane is about 5 feet square; it permits the interior of the pit to be viewed with facility from the outside, and when full of flowering plants a novel and pleasing effect is produced.

On a south wall was a full crop of Apricots, Plums, Peaches, and Nectarines, it having been protected by coping and nets during the spring months.

New Plants.

72. Quercus rotundifolia. *Sibthorp.*

When Dr. Sibthorp was in Greece, he found an evergreen Oak, to which he gave the name of rotundifolia. The same species was found by Lady Liston near Constantinople, as we know from a specimen in our possession, communicated by the late Mr. A. B. Lambert. It seems to be distinct from the Spanish Ilex called *rotundifolia* by Lamarck. The leaves are thick, evergreen,

almost orbicular, or even oblate, sparingly toothed, and thickly covered on the underside with a loose felt; when young they are woolly on both sides. The acorns are unknown. No doubt it is possible that this is a mere form of the evergreen Oak; but even in that case it would be welcome here. Its leaves, however, are much more coriaceous than is usual among Ilices, and their tendency to vary the customary form is not by lengthening, as happens even in Q. Gramuntia, but by widening, so as to become broader than long.

FLORICULTURE.

Culture of the Pelargonium.—Those who have the opportunity of frequently witnessing the fine specimens of this plant, which are annually brought to the Chiswick and Regent's Park exhibitions, may perhaps imagine that further directions on its culture are unnecessary; such is, however, unhappily not the case; Pelargoniums, even in good establishments in different parts of the country, are often very indifferently managed; and as the following is a method by which first-rate specimens may be produced, I have ventured to furnish it. I prepare the soil of an open border about the middle of July (this year I have been a little later) and plant my cuttings. The situation chosen is exposed to the sun during the middle of the day. In about six weeks, the cuttings will be sufficiently rooted to remove, and I pot them in 3-inch pots. To prevent the worms getting into the pots, they are placed on a temporary stage, and allowed to remain in a shady situation about three weeks, by which time the plants will be well established, and bear removing to a more exposed spot, where, under the influence of the sun and air, the wood will attain a necessary degree of hardness. Here they remain until taken into the house for the winter, which is generally done about the end of September; the time varies according to season, but they are housed before danger arises from frost. To improve the appearance of the plants, and make them compact and bushy, I stop them at the third or fourth joint, and shift them into 5-inch pots, using a little turfy loam and sand with the compost, to allow the water to pass freely through the soil. I give but little air during 8 or 10 days; the plants will be then re-established, and afterwards as much air may be given as the state of the atmosphere will permit until the beginning of December. The side-lights must be kept closed during the prevalence of cold winds. The pots by this time will be well filled with roots, and the plants will require shifting into 8-inch pots. The bone-dust which is now added must be used with caution, being of a drying nature it is not used near the surface of the soil; the shoots are again stopped at the third joint, the house is kept at a temperature of 45° Fahrenheit for about 10 days, and then allowed to fall to 40°, or 42°, at which it is kept. The flues are damped two or three times every night, to prevent the air from becoming too dry, and a little top air is admitted whenever the weather is sufficiently favourable. About the middle of February, those plants which are intended to be large specimen plants are shifted again into 9-inch pots, those of vigorous growth will require a size larger. A small stick is now put to each stem to train them into uniform and well shaped plants. In the beginning of April, when fires are discontinued, the plants are syringed over the top three times a week; this is done about 4 o'clock, at the time the house is closed, and continued during three or four weeks. The house is well damped every evening, and the bottom and the top sashes opened the first thing in the morning, to allow the damp air to escape, and during the day all the air is admitted that can be given with safety. The plants when beginning to bloom are freely watered, and protected from the scorching rays of the sun during the middle of the day by means of canvas; and are thus retained in blossom a much longer time than would be possible if this precaution were omitted. When the plants are housed, the decayed leaves are removed; and whenever the greenfly makes its appearance, the house is well fumigated: to do this effectually, it must be performed when the plants are in a dry state, and they must be well watered the day following. When the flowering is over, the plants are exposed for about a fortnight to the sun and air to harden the wood before being cut down. Those plants which are intended as specimen plants the second season, after heading down are placed in a sheltered situation where little water is given, and as soon as the new shoots are an inch long are repotted into pots from one to two sizes smaller; the old soil is shaken from the roots and good drainage given. The plants thus treated are kept in better health during the winter, from having less soil about their roots. When repotted, they are placed upon a stage in a shady situation, removed into the house at the proper time, and undergo the same treatment the second winter as described for the first. When those plants which are intended for specimens begin to show their bloom, they receive additional attention; a little liquid manure is occasionally given, they are no longer syringed over the top, bees are kept out of the house by means of gauze blinds, and every precaution is taken to preserve their beauty; they are never allowed to flag from exposure to the sun, or want of water. I recommend every grower to begin early to train his plants for specimens; when the shoots are young and tractable, any direction may be given to the stems; a uniform and handsome appearance will arise from the practice, and the plants will require fewer supports and less pulling about; at the time they receive their final dressing the flowers should be so arranged as to present an equal distribution of bloom over the head of the plant, to effect which the stems must be secured to small Willow twigs. Practice alone can teach the art of dispersing flowers properly; the less art is employed the better, and the means should always be kept out of sight. The compost I use for my Pelargoniums is the following: Two barrowfuls of good maiden loam with the turf, one ditto well rotted cow-dung, three years old; this requires frequently to be turned over in winter, to destroy the worms and insects; one peck of silver sand, one ditto of bone-dust. For the winter repotting a little more sand is added. *S.*

National Floricultural Society, *July 27.*—Mr. Henderson in the Chair. Mr. Turner, of Slough, sent a box of seedling Picotees and Carnations, consisting of some very fine varieties. Amongst the former, Finis and Mrs. Headley, a beautiful red-edged flower, received first class certificates. A similar award was given to a scarlet flake Carnation named Exit. King John,

a very fine rose flake flower, looks as if it would also prove an acquisition. Mr. Cole, Nurseryman, St. Alban's, contributed three bedding Calceolarias, partaking of the habit of Albiflora, they were called Delicata, Novelty, and Purity, the latter a pretty free blooming clear white variety, that will doubtless be desirable for bedding purposes, also cut blooms of his seedling crimson variety, Eclipse. Mr. Bragg had a seedling purple flake Carnation, called Omer Pacha, and a seedling rose flake called Flora, both of average quality. Mr. Cole sent a variegated horse-shoe Geranium, Variegated Queen, which received a certificate of merit. Messrs. Wood and Son, of Maresfield, produced a box of their new Hybrid Perpetual pillar Rose, Duchess of Norfolk, a bright coloured variety and very fragrant; it received a certificate of merit. From Mr. Turner came two very pretty seedling Verbenas. Lacon Lacon, a white eyed bright pale pink sort, was awarded a first-class certificate; the other was called Wonderful, a dark purple kind with a large white centre, and very striking; this received a certificate of merit. From the same establishment was also a good blue Verbena, called Blue Beard, together with some other varieties, the best being William Barnes, crimson with a very dark centre, Madame Schmidt, Augustine, Mademoiselle de Frileuse, Mrs. D. Tyssen, Mrs. F. G. Caley, (clear white, small blush eye), and Orb of Day, an excellent deep scarlet variety for bedding.

CARNATIONS: *Mary*. The soil which some of the best florists use for these flowers is the top spit of a meadow taken off long before it is wanted, and frequently turned, in order to clear it of wireworms: it is by no means heavy soil; the only addition it receives is about one barrowful of good decayed stable-manure to three of loam. Sufficient material for the following year is mixed every August.

Miscellaneous.

Tropæolum tuberosum.—Although not cultivated as yet in the Society's garden, this deserves mention in an account of newly introduced esculents. It produces an abundance of very pretty yellow and red pear-shaped tubers from 2 to 3 inches long; and since it is as hardy as a Potato there is no reason to doubt its being cultivable; but it is a question whether its flavour, which is not very agreeable in its ordinary condition, can be improved in England, as it is in La Paz, its native country. Upon this subject M. Decaisne has some interesting observations to the following effect:—"The tubers of the Tropæolum tuberosum, designated Ysaño at La Paz, require to be prepared before they become edible. Indeed when they were prepared in Europe like Potatoes, and immediately after being taken up, their taste was very disagreeable. But a mode of making them palatable was discovered in Bolivia, and the Ysaño has there become, if not a common vegetable, at least one which is quite edible. The means consist in freezing them after they have been cooked, and they are eaten when frozen. In this state M. Weddell affirms that they constitute an agreeable dish, and that scarcely a day passes at La Paz without two lines of dealers being engaged in selling nothing except Ysaño, which they protect from the action of the sun by enveloping it in a woollen cloth and straw. The ladies of La Paz are all very fond of the Ysaño, and in the season of the taiachas large quantities are sopped in molasses, and taken as refreshments during the heat of the day. It will be perceived by the preceding, and by the preparation which the Ysaño must undergo, that the cultivation of the Tropæolum tuberosum, and likewise that of the Ulluco, has but little chance of being successful among us, our climate being entirely different from that of La Paz, the mean annual temperature of which (50°) is, however, little different from that of Paris (51.44°). Many plants can resist intense cold in the very dry climate of La Paz, where the dryness of the air allows several Cacti to grow as on the elevated table-lands of Mexico, although the thermometer falls nearly every night below the freezing point. But such is not the case in our moist climate; for we know that a slight fall in the temperature is sufficient, either in spring or autumn, to destroy the stems of all herbaceous vegetables." *Journal of Hort. Society.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The sudden occurrence of bright hot weather, after a long period of cold and gloom, is very trying to plants in flower, especially to Fuchsias and other greenhouse plants, which, unless carefully shaded and liberally supplied with water, will soon drop their flowers. It is seldom convenient to use the syringe freely in this house, but the surface of the beds should be kept moist in warm weather, which will greatly assist in preventing excessive dryness in the atmosphere, and prolonging the duration of the bloom. See that the soil about the roots of specimens growing in the borders, and the twiners, is not allowed to get dry under the surface, which sometimes happens through keeping the surface continually moist by slight sprinklings. Specimens that have matured their season's growth should, however, be more sparingly supplied with water at the root, in order to promote the ripening of the wood. Orange trees, and other plants known to be liable to the attacks of red spider, must be frequently examined for this pest, and well washed with the engine immediately it is perceived, taking care not to bruise or injure the foliage, and placing the affected plants so that every leaf may be reached. Also keep a sharp look-out for other insects, and spare no trouble to keep these under. Go over the twiners frequently, and keep the shoots nicely regulated, cutting out where necessary, to prevent their being too thick, and shortening any that hang down so low as to interfere with other things. Attend promptly to the removal of decaying specimens before they become unsightly, and also see to having plenty coming forward with which to supply their places. COLD PITS.—The stock here will probably require re-arrangement about this time, as some of the specimens, having completed their season's growth, will be better in a shady situation out-doors, and their removal will allow of giving more space to those left. Young growing stock, and late flowering plants that have yet to make their season's growth, should receive the most careful attention, as, if well treated, they will make rapid and vigorous growth at this season; and nothing in the way of good soil, careful potting, or proper accommodation, will compensate for the want of this. Indeed, there is no possibility of securing free growth from hard-wooded plants in bright hot weather, except by moderate shading, and maintaining a moist atmosphere by sprinkling the plants overhead morning and evening, and air must be given liberally to keep the wood strong, avoiding, as much as possible, exposure to drying winds. Any of the specimens which require more pot room should be shifted as soon as possible, taking care to have the ball moist, and keeping them rather closer, and the atmosphere moister than usual, for a fortnight after potting. Get the young shoots tied before they begin to fall about and crowd, and injure each other. Cut down Pelargoniums as soon as the wood is properly hardened, and keep them very sparingly supplied with water at the root until they start into growth; but sprinkle them over-head frequently, which will cause them to break more strongly. Get cuttings of favourite sorts rooted, and attend to those that were rooted early in the season. Continue to pot Cinerarias as strong suckers can be obtained, placing them in a close part of a cold frame until they get established in their pots, but avoid placing them in heat where they speedily become a prey to insects and mildew, and never do any good.

FORCING DEPARTMENT.

PINERY.—Take advantage of bright warm weather to strengthen the growth of plants in dung frames, by giving a free supply of air while it can be done without lowering the temperature too much. See, however, that young stock is not allowed to become too dry at the root, as this and the change of atmosphere recommended would probably cause some of them to fruit prematurely. Keep the atmosphere as moist as possible for plants swelling their fruit until they begin to show symptoms of colouring, and give them a liberal supply of manure-water at the root; but while colouring avoid moisture as much as possible. A slight shade will be indispensable for plants that are near the glass and growing freely, to prevent their leaves getting scorched, but use a thin material, and this only when it cannot be dispensed with. VINERIES.—Where the fruit has been cut some time and the Vines seem inclined to go to rest, keep the atmosphere as cool and dry as possible. Do not allow the foliage to become a prey to insects, but endeavour to preserve every leaf until its natural period of decay. Give abundance of air to fruit colouring and do not allow plants of any kind to remain in the house to cause damp, which if allowed at any time to settle on the berries spoils the bloom. Keep a watchful eye for insects in the late houses, and if spider or black thrips is perceived wash the infested leaves with a sponge, choosing a cool morning for the operation. This will be more effectual than washing with either the syringe or engine, will hardly occupy more time, and there will be no danger of spoiling the bloom, and some excellent growers avoid syringing after the berries are set, believing that it injures the bloom. Keep up plenty of moisture in the atmosphere, and give inside borders a liberal supply of manure water. PEACHES.—Trees from which the fruit has been gathered should be freely exposed to air, leaving the ventilators open night and day, and every means should be used to preserve the foliage in a healthy state as long as possible; for except this is attended to there will be no possibility of securing well ripened wood. Do not allow the borders to get dry all at once because the fruit is gathered, but keep them moderately moist until the wood appears to be well matured. Where the fruit is ripening it will be advisable to shade the house on the forenoons of bright hot days, which will prolong the supply, and will not injure the flavour but rather improve it.

FLOWER GARDEN AND SHRUBBERIES.

After the plants have fairly covered the ground, the great point will be to preserve that symmetrical appearance over the whole of the beds which, in a geometrical flower-garden, is absolutely necessary to render the effect pleasing. To do this will involve frequent attention and considerable labour for some time to come, as some of the plants will incline to grow much too strongly for others, and will also be continually encroaching upon the edgings, extending beyond their proper limits. Plants of a weakly habit of growth, as the Melindres varieties of the Verbena, &c., may be assisted in dry weather by an occasional watering with manure water; but for those that grow too strongly there is no help except thinning out and pegging down the shoots. In shortening back shoots that incline to extend beyond the edges of the beds, avoid the least appearance of formality, by thinning out the under shoots, and keeping all parts of the bed of equal depth or thickness, or allowing the plants to, as it were, die away at the edges, according to the arrangement. Climbers on walls must be attended to as they advance in growth, keeping the young shoots neatly laid in, &c. The climbing Roses will also require to be gone over occasionally, for the purpose of cutting off the decayed blooms; and any weakly old wood should be cut out at the same time, to allow of laying in the strong young shoots, which will bloom much finer next season than the old wood would do. Phloxes and other herbaceous plants must be neatly tied up, avoiding huddling the shoots together, as is sometimes done even about well-kept places, to save time. Any of the perpetual blooming Roses that have flowered very freely should be assisted by a liberal watering with manure water from the stable or farm-yard tank; indeed, too much of this can hardly be given to any of the autumn-flowering varieties.

FLORISTS' FLOWERS.

CARNATIONS AND PICOTEES.—In some localities these favourite flowers will be getting fast into bloom; the plants in pots should be removed under an awning similar to that used for Tulips. Here they may be arranged on a raised platform or not, according to the taste of the amateur—the Picotees grouped on one side, the Carnations on the other, taking care that the tallest plants are behind, and at the same time contrasting the colours as much as possible. Pipings may be put in on a gentle hotbed, the grass or shoots are usually layered at a somewhat later period; but where there are small ones, and in a position that cannot well be brought down to layer, it is a good plan to obtain plants struck from cuttings. Plant out in showery weather Pink pipings which have taken root; or, should the weather prove dry, cover the bed with any light awning, keep them moderately moist, and they will speedily establish themselves. Ranunculus roots may be taken up as soon as the foliage turns yellow, for should rain ensue, they would emit fresh fibres, and, if then taken up, their destruction would be certain.

HARDY FRUIT AND KITCHEN GARDEN DEPARTMENT.

Select a bit of open light ground, and prepare it for winter Spinach, by giving it a heavy dressing of manure, and trenching or digging it deep. This crop should be sown at once and in drills in beds, allowing wide alleys, so as to be able to gather the crop without treading the ground; also provide ground for winter Onions, &c. Finish planting out Broccoli and Winter Greens, as speedily as ground can be obtained; for unless the autumn should prove very favourable, those planted after this time will not attain much size. Get Endive planted out on very rich soil; also Lettuce to maintain the succession, and attend to other small salad herbs. See to securing a good supply of Parsley for winter use, which is always largely in demand. A good bed should be planted in some convenient place for protecting it during severe weather in winter. The soil should be of a light texture, deep, and thoroughly drained, as a preventive against damp in winter. New plantations of Strawberries should be made at once, selecting the strongest young plants, and keeping them well supplied with water until they get established. Attend to Celery and all recently planted crops with water, if the weather continues warm and dry.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 27, 1854, as observed at the Horticultural Gardens.

July.	Moon's Age	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 1st, 1846—therm. 92 deg.; and the lowest on the 3d, 1837—therm. 38 deg.

Notices to Correspondents.

AQUATICS: *W. T.* If what you call a Sacrit Bean is the Nelumbium, as we suppose, then, in that case, you have done all you can for it. The withered leaves will not recover. If it forms new ones give it plenty of sun, no shade, and in the winter pour the water off, and allow it to dry in its own mud, keeping it so till you want to start it in the spring.

BOOKS: *S S.* Any *respectable* bookseller can procure it, if he chooses, in the ordinary course of trade. We believe it is published by Longmans.

COURTYARDS: *J T.* The only materials that will prevent weeds from growing through them are asphalte and Portland cement; the latter, however, does not stand well when exposed to heavy traffic.‡

DELPHINIUM: *A B.* Your seedling is neither new nor any improvement upon what is called mesoleucon.

GINGER: *J T.* It must have a rich soil, well drained, and plenty of heat and moisture while growing, therefore your conservatory will not suit it; it only does well in a hotbed, Pine pit, or warm stove. As it ripens, gradually withhold water, till at last you give none at all. After the crop is gathered, the oldest tubers may be wintered in dry sand for planting again. As to Fuchsias, there are none that we know of with white corolla and red calyx and tube.‡

NAMES OF PLANTS: *J C X.* Leycesteria formosa, from the Himalaya Mountains.—*R A.* Centaurea odorata.—*S J R.* Canna pallida.

PEAS: *F. & A. Dickson & Sons.* Having made the necessary enquiries, we are able to say that your Early Favourite Pea is a distinct and very useful variety among the class of second earlies, to which it belongs. The pods are unusually full.

WINDOW GARDENING: *F T.* We presume that your window plants suffer from the dryness of air and the absence of effectual ventilation.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.: Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodorizer and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 20A, Upper Thames Street.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Zoology, Geology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
The next SESSION will begin early in AUGUST. The Annual Fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILEY, Cirencester. Price 1s.

SCHOOL FOR GENERAL AND SCIENTIFIC EDUCATION (especially with regard to AGRICULTURE), Wickham Market, Suffolk, conducted by Mr. G. DOWNES.
At this establishment a sound and liberal education may be acquired on moderate and inclusive terms.
Soils, Minerals, and Manures carefully Analysed.

The Agricultural Gazette.
SATURDAY, JULY 29, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, August	1	
WEDNESDAY, —	2	Meeting of the Highland Agricultural
THURSDAY, —	3	Society at Berwick.
WEDNESDAY, —	2	Agricultural Improvement Society—
THURSDAY, —	3	at Armagh.

MOST of our readers will remember the extract which we lately published from a letter on Agricultural Education, by Viscount EBRINGTON. His lordship's plan was brought under the consideration of the delegates from the local institutes in union with the Society of Arts at their recent conference. There was no very definite expression either of concurrence, or otherwise, elicited, but the Society was requested to direct their attention to this subject with a view to farther action.

We have always felt that a body which has so invigorated the Mechanics' Institutes of the country might do immense service to its agriculture, if it would in like manner endeavour to inspirit the Local Agricultural Societies. Whether these will ever prove the proper centres of an educational influence such as Lord EBRINGTON desires to see in exercise is more than doubtful; but even though the result of such an effort should merely be the restoration of them to something like their life and energy of 10 years ago, good would be effected. The more important of them—our county, and still more our large provincial societies—might very well so far be connected with the proposed board of examiners as to give a local sanction to the diploma they would grant—and this would probably increase its substantial value to the winner of it, although its intrinsic merit might not be affected.

The discussion on the proposal, as very shortly referred to by Lord EBRINGTON, could hardly bear the name. One portion of his proposal was rejected or postponed—the other, which had regard only to the first stages of the movement, was accepted, and we may hope that in accordance with the resolution then passed, the council of the society will direct their attention to the possibility of establishing some such means as the proposal indicates, for granting its diploma to successful candidates after subjection to an examination, such as "educated Englishmen" ought to pass. The terms and methods of such an ordeal are, of course, proper for future consideration: it is a matter of importance to have succeeded in the mean time, in bringing it prominently and acceptably before so capable and energetic an educational association as the Society of Arts.

ON Wednesday Mr. MECHI's annual gathering took place at Tiptree Hall farm. His invitation gathered 300 of all ranks, noblemen and commoners, clergymen and laity, men of science and of practice, Englishmen and foreigners, men whose only common bond of union probably, but that a most efficient one, was interest in the agricultural experience, the public service, and above all the personal merits of their host. This large number spent a most delightful day in the examination, under Mr. MECHI's guidance, of the methods and results of Tiptree management, and in listening to his most lively and instructive commentary, as each successively passed under our review. The crops of Wheat and Oats and Barley are this year excellent—more than 5, and 9 or 10, and 6 or 7 quarters per acre being at present fairly promised by them respectively. The Mangold Wurzel crops are very forward, and in vigorous growth. The Italian Rye-grass is not so luxuriant as might have been expected. The contrast between neighbouring fields, where the dividing fence is the Tiptree boundary line, was at many points most obvious, and the merits of the liquid manure system, as compared with ordinary farm management, were confidently, and we believe justly, deduced from it. This was of course the leading idea insisted on throughout the day, and evidence was adduced from other quarters telling even more strongly in its favour than Tiptree farm itself. Thus, a letter was read from Mr. KENNEDY, of Myre Mill, stating that during the past month he had kept on 33 Scotch acres (rather less than 40 statute acres) of Italian Rye Grass, 250 "large cattle," 465 sheep, 200 pigs, and 25 cart-horses. It is not too much to say that those 33 acres must in that time have yielded nearly 800 tons of food. Whether this was the first or second cut we do not know—probably the latter. But it is obvious that under the dripping skies of Ayrshire the liquid manure system, as developed at Myre Mill produces results which are not dreamt of by the most sanguine agriculturists in the south, and which Tiptree itself, under its drier climate, will probably never parallel. Another Ayrshire farmer, Mr. TELFER, was present on the ground, and stated that he had made upwards of 20 tons of hay per Scotch acre per annum of his Italian Rye-grass at three cuttings—the two first of which were 25 tons of Grass apiece, and the third upwards of 15 tons. Mr. CAIRD electrified the company in his address, after dinner, in the tent, by an announcement to the above effect.

We remember in Captain BASIL HALL's charming book of travels, that he gives an account of a leap which he once saw taken clean out of the water by a fish some 60 feet in length, but he introduces it by several pages of introductory discussion on the policy of extraordinary statements of this kind. Admitting the duty of a writer not to risk his credibility even by the statement of a *true* story, if it bore an extraordinary degree of improbability about it, he nevertheless *does* tell the story, having, however, first adduced what evidence he could collect from other witnesses of similar feats by whales elsewhere. We could have wished that Mr. TELFER's experience had been illustrated and argued in like manner, instead of being abruptly announced; for it was not believed. Mr. KENNEDY's statement is, however, so far corroborative of it, that in his case too, 24 tons per acre must have been yielded at a cutting—and leaving it for Mr. TELFER, if he shall think it necessary, to give a more detailed account of his experience, we merely urge that this corroboration of his statement is strongly in his favour.

Among the many other points alluded to by Mr. MECHI in the course of our walk, were the folly of wasting town sewage and sending to Peru for an expensive substitute; the importance of determining by continuous experiment and observation the right seeding per acre under altered circumstances of soil and cultivation; the substitution of Vetches and Turnips for the long fallows prevalent on the stiff soils of the neighbourhood—the policy of winter forking by hand-labour—the mischief done by hedge-row timber—the merits of the several machines which were exhibited—Mr. SPOONER's and Mr. CHANDLER's rival water drills—Mr. GARRETT's threshing machine — Messrs. DRAY's and Mr. GARRETT's rival reaping machines—all of which were shown in operation.

The after-dinner portion of the day was as amusing and instructive as any of it. Mr. MECHI was himself as full of hearty indignation and sanguine expectation in reference to past and present and the future of English agriculture as on any previous occasion, and Mr. CAIRD gave a most substantial and instructive speech in reply to the toast of "English and Foreign Agriculture," with which his name had been connected. The company separated about 8 P.M., feeling, we are sure, more strongly than ever, that if, as he asserts, the battle of agricultural progress has been fought over Mr. MECHI's body, it has lost during the encounter none of that genial, hearty, benevolent, enthusiastic spirit by which it has hitherto been inhabited.

SURROUNDED by a sea-coast so redundant in fish, our economy of the refuse as manure is deserving of more detailed investigation than we were able to bestow upon it when last addressing ourselves to this subject.

Now that the warm weather has set in, the smell of a fishing village is of itself sufficient to prove that the amount of volatile matter escaping into the atmosphere is of no ordinary magnitude; and although less perceptible to the senses, the quantity of soluble matter washed from fishermen's dunghills into the ocean is certainly nothing less. Altogether the loss of fertilising elements is immense.

During the herring fisheries one barrel of offal is derived from 14 of fish, or 14 barrels of herrings yield one of refuse, and the proportion will be greater in some other kinds of fish, as the haddock and cod, where the head and part of the backbone are removed in the curing, while a large quantity of worthless fish is always caught in nets, and never brought to land; and when we further add to this the night soil of the fishing villages themselves, the result will be a large per centage of the weight of the whole "take of fish," while in some exceptional cases the whole take itself is sold to farmers at a few shillings per load for manure.

The present manner in which this immense supply is disposed of, we need hardly stop to describe, but at once proceed to the more important question of securing and applying it to the soil; and here the diversity of practice which has arisen of late, or the liquid manure systems and solid manure systems of modern times, call for a corresponding diversity in the supply and manufacture of artificial manures of this kind. In other words, we must either have a soluble manure fit for applying with the hose and jet, or a solid one in a sufficiently powdered state for applying with the drill.

The raw materials themselves are so various in value as to require separate manufacture prior to forming a general compound for application either in a liquid or solid form. Shells, for instance, collected in procuring bait, and forming a conspicuous item in every fisherman's dunghill, will require different treatment from gut; and the same may be said of bones. To throw shells, bones, blood, gut, coal, peat, or wood ashes, night soil, and urine into one open and exposed dunghill, to undergo fermentation, is obviously to sacrifice the more valuable elements of one portion before any effect is produced upon another—a conclusion too well known to require proof.

Shells and bones may be crushed or ground to dust, in which state they will ferment more rapidly when mixed along with the others; but the quantity of ashes will be insufficient to absorb the volatile matter given off during such a process. A large addition of ground peat, sawdust, rotted turf, or light articles of this kind, will be required besides. At present earth is generally used, such as the scourings of ditches or headlands gathered up by those who purchase the offal of herrings, &c., and the quantity required is considerable, as many of our readers are doubtless aware from experience; but earth is too heavy and worthless a substance, entailing a serious loss of time and expense in the manufacture and application. No doubt the absorbent powers of dried clay are great, as the successful practice of China proves; while for sandy and calcareous soils it possesses peculiar recommendations besides, and, therefore, for such may be used; but applied to clay soils, it is worse than useless, while its agency in the work of decomposition may be questioned. It is otherwise with the vegetable substances just

noticed, for they are not only good absorbents, but also subject to decomposition, forming enriching manures of themselves.

Were covered manurials erected in every fishing village, so as to exclude the influence of heat during summer, and frost and rain during winter, and the whole refuse of every "boat's crew" thrown daily into them, along with a sufficiency of sawdust, peat, earth, &c., shells and bones being previously crushed or dissolved in acid, there cannot be a doubt but a very valuable manure may thus be formed, while the sanitary state of such villages would be very much improved.

Several practical questions may here arise as to whether fishermen are the proper manufacturers of such guano—or whether their landlords should not erect and let to regular manufacturers such manurials, they purchasing the raw products of fishermen daily—or whether farmers should not do so, thus saving the erection of village manurials, excluding monopoly, and ensuring to fishermen a better market for their refuse.

Experience must be left to answer such questions satisfactorily. None of these plans would interfere with the successful working of the others. Fishermen, for instance, if they found they could make more of the manufactured article than the raw material, would be at liberty to do so; while farmers, who had sawdust, peat mould, &c., at hand, could purchase refuse at so much per load daily, if they found they could make the cheapest and best manure themselves. The regular manufacturer in large villages would, however, have many advantages, and no doubt would be able to make a better and cheaper article than either fishermen or farmers, giving more for the raw material at the same time, but he could have no monopoly if landlords took care of their own and tenants' interests. Sea-weed could be gathered, dried, ground, and added to the mass, or decomposed in a green state along with peat mould, &c., and afterwards added, or sold separately, as desired.

With resources so great and promising, it is manifest therefore that something should be done to turn them to advantage. More than the landlords of fishing villages are here interested; and were an experiment fairly made, there is no doubt but much comparatively idle capital would find a profitable and productive investment. Fishermen may be as idly disposed as they are represented to be, but they are not insensible to the value of money; and were they to receive a sure price for all sorts of fish brought to land, much of the squalid misery and idleness which characterise them would disappear.

THE BREEDING OF HORSES.

In a communication which I addressed a short time since to the Royal Agricultural Society of England, on the subject of the best means to adopt for the improvement of the breeds of horses calculated for our cavalry and artillery services, I recommended a general distribution of rewards throughout the country, by means of the various societies, sufficient to cause the most useful well-bred weight-carrying mares to be devoted to the stud instead of being, as at present, worn out in ordinary labour; and a three parts bred weight-carrying horse to be employed as a stallion in the place of the third-rate thorough-bred horse now too generally used, by which union we may reasonably expect a half-bred horse capable of carrying a good weight, with all the qualifications of an excellent hack, and with all the advantages derived from an equal admixture of pure breed. These observations, however, though the result of 25 years' careful and somewhat extensive observation and experience, are condemned *in toto* by the writer, who occupied the editorial chair of the *Mark Lane Express*, on Monday, July 3. This gentleman, not content with confounding me by his own experience or opinion alone, ventures also to fire at me two paper bullets from the pens of two "own correspondents" of the *Express*, which, however, appear to me to have but a secondary bearing on the subject. If I am not entirely annihilated by this combination of attacks—if I still survive after being thus charged and ridden (written) down by such thorough-bred (riders) writers—I hope my antagonist will attribute it to that breed which, as he says "carries the dandy officer through the many hardships of a campaign," the same mystical purity of blood from which a greyhound "gathers the conquering speed of his course," and the "foxhound the bottom that sees him through a run," which wondrous faculty, he should add, enables a Shorthorn or a Leicester to get fat quickly, an Alderney cow to give very rich cream, a Cotswold sheep to have very long wool, an Essex pig a very short tail, and, I was going to add, a Spanish donkey very long ears. Wonderful faculty that secures for the fortunate inheritor the possession of such opposite qualifications as we find in the thorough-bred horse and the well-bred pig, both aristocrats in their way, one remarkable for his spirit, activity, and disposition to keep lean, the other for his stolidity, inactivity, and propensity to get fat. A golden recipe is also gratuitously given us wherewith to judge man, horse, or hound. For the future (there is no getting on without it, the writer observes) our first enquiry will be "How is he bred?" Once satisfied on this point, and we have but little to fear. It is quite true that some of the veriest weeds we have seen bought for a ten-pound note to run before the bars of a stage, could boast a lineage of unspotted purity in direct descent from the Darley Arabian or Flying Childers. It is equally true that some of the worst hacks we have ever known—daisy cutters with crooked legs—have been either quite or only one remove from thorough-bred. We must forget all this for the future, for all we need to care about is—how is he bred? To drop, however, the ironical vein, which we have only pursued in order to show the great absurdities into which the writer may be led by pursuing the argument on which he founds his article, it may be well to observe that when a critic, armed with the authority, and protected by the *incognito* of an editorial leader, ventures to exercise his skill on an antagonist, he should take care, not only that he thoroughly understands the subject before him, but also that he does not misrepresent the party he attacks. He says that my advice, if followed, would cause the *degeneration* of our breed of saddle horses, and that I at once *ignore* the keystone to our success—the agent that has made the English saddle-horse what it is. Now, if I condemned, despised, or underrated the thorough-bred horse, why should I recommend a stallion possessing three-fourths of the very breed that I condemn? Surely this alone ought to be sufficient to shield me from the censure heaped upon me. If the writer condemns cross-breeding and half-breds, why not keep to thorough-breds altogether. If, as one of the writers quoted states, the thorough-bred horse makes the best of hunters, the noblest of chargers, and equal to any for the phaeton or drag, and a steady cart horse to boot—if he is capable of carrying 15 stones across the country, why not breed thorough-bred horses for the cavalry entirely? Or, better still, go to the fountain-head at once, and mount our heavy dragoons on Barbs and Arabs—the progenitors of our blood horses—and who, though little more than 14 hands, can boast a pedigree direct from the Prophet's mares. The writer quoted instances of the case of four thorough-bred horses, two of them great winners, and two the sires of winners, each capable of carrying 15 stones. Granting this, for the sake of argument, there are yet not 20 such horses in the kingdom, or the world; and what chance is there of the ordinary breeder availing himself of such animals, when their services are gladly secured by the owners of mares for racing purposes, at such sums as ordinary horses are expected to be bought for? If, then, these first-rate horses cannot be procured, the breeder must be contented with such as he can get, and is generally obliged to put up with a third-rate animal. My opponent concludes by stating that if my recommendation is followed, Mr. Strafford may at once burn his herd-book, and buy up some half-bred bull for a further improvement in the short-horn; in other words, because I recommend, for the purpose of breeding, half-bred horses of greater substance, that three parts bred weight-carrying stallions should be used instead of second-rate thorough-breds, *ergo*, the pure short-horn must be improved by the use of a half-bred bull. I will leave our readers to determine whether this is a logical conclusion. If I had recommended a half-bred stallion to improve our breed of race-horses, there would have been some seeming justice in the parallel, but not otherwise.

I respect a good pedigree as well as my opponent, but for no mystical or superstitious regard, but because it assures me that much care has been employed for many generations past to secure the perpetuation of certain excellencies, and the avoidance of certain defects, by carefully weeding out the latter and retaining the former; and, consequently, that there is a much greater probability of obtaining what we require by pure breeding than by using a cross, which may introduce certain faults possessed by his progenitors, if not by the animal himself, with whom the cross is gained.

This is the only rule that holds good without an exception with regard to purity of blood in all animals; and when once a breed is established by long-continued vigilance and care, by the cutting off and condemning, without mercy, the slightest defect—though faults may appear and re-appear, like the hundred-headed monster of antiquity, it is far better than to rest satisfied and preserve the breed pure. If the improved short-horn is the animal that at the earliest age will convert a given quantity of food into the utmost amount of butcher's meat—and these are the qualifications we want—there is no occasion to cross; so likewise with the sheep and the pig, but in our saddle-horses we require those qualifications which we can only secure by the happy combinations of different breeds. We obtain from the thorough-bred horse the small head, lengthy quarters, powerful thighs, extended stride, great speed, and unconquerable bottom; but it is from the native breed, the Norfolk trotter, or the old English hunter or hack, descendants to a certain extent of the ancient Spanish horse, considered by the old Duke of Newcastle as the best horse for the *manége* in the world, that we acquire the oblique shoulder, elevated withers, good forehead, safe walk, and fast trot, accompanied by a larger and wider frame, greater bone, and more powerful digestive organs than the blood horse possesses. When once these varied qualifications are happily combined, as it often is in the three-parts bred horse, it is a *fact accomplished*—the means in our hands for continued excellence, by which we can impart to the next generation the requisite amount of breeding, without that risk of weedyness which so often attends the first cross. In judging the merits of a breed I would not, as one of the writers suggests, take the best specimens, but rather the average of the breed; and when I find that the thorough-bred horse, as a rule, has a smaller carcase, narrower chest, longer legs, smaller bones, and slighter sinews, than the half or three parts bred horse, even although these bones and sinews may be relatively stronger than in other horses, I surely would not select the thorough-bred for the purpose of imparting greater weight and substance to the expected offspring. Nothing can be more unscientific than to compare breed and pedigree in horses with that in man. Why, I have known a nobleman, weighing nearly 20 stone, whose family came over with William the Conqueror, but whose physical conformation resembled far more a Suffolk punch or an Hereford ox than that of a thorough-bred horse; and I have seen a wiry plebeian, a "pariah" if you please, whose ancestors no herald could trace, but whose spare and muscular form and untiring energy presented a close resemblance to that of a thorough-bred horse. Our boxers, pedestrians, opera dancers, and professors of gymnastics, can rarely boast of much pedigree or breed, and yet they may justly be considered as the most perfect specimens of the human form. The fact is, the human race has not been kept distinct, like that of animals, and thus we find every variety of size, temperament, and physical conformation in every rank of life, and mental development of every degree in bodies of widely different forms and capacities. *W. C. Spooner.*

THE ROTATION OF CROPS.

Since the investigation of the chemical composition of our crops has increased in minuteness and precision, the explanation of the cause of their rotation has become more difficult rather than more simple. It is familiar to every one that the necessity for a rotation has been usually attributed to different crops removing different inorganic constituents from the soil. Thus certain plants require for their luxuriant growth a large quantity of potash, and they must be followed in the rotation by some other plant which does not extract that element from the soil, or at least only in a comparatively small quantity; and each individual crop can only be successfully repeated, when, by the lapse of time, a sufficient quantity of its characteristic constituent has been liberated from some inert form of combination in which it exists in the soil. The differences which the earlier analyses showed between the ashes of different plants have become less marked, with the advance of more accurate investigation; and that, coupled with the unequivocal fact that all fertile soils contain their valuable mineral constituents in quantity sufficient to supply an almost endless succession of crops, though not altogether excluding this view, has certainly thrown difficulties in the way of the unhesitating adoption of what we once supposed so unquestionable a doctrine.

Mr. Lawes, in one of his recent papers, has suggested another view, of much ingenuity, and deserving of notice; though I confess it scarcely appears to me to be compatible with all the facts at present known to us. He believes that the necessity for a rotation depends not so much upon the exhaustion of the inorganic constituents of the soil, as of its nitrogen, and that the exhausting crops are those which require for their growth the largest expenditure of that element. His experiments have led to the conclusion that nitrogen is not a necessary constituent of the manure applied to the Turnip, while it is absolutely essential to the more exhausting Wheat, and to the cereals generally. Of course it is not meant that no nitrogen is required for the Turnip, but simply that the quantity contained in the soil or derived from the air (in the form of ammonia or nitric acid), is sufficient for its requirements. But with Wheat, not only must nitrogen be present in the manure, but it must be there in a quantity out of all proportion to that actually assimilated; in other words, only a small proportion of the nitrogen of the manure makes its appearance in the plant, the rest being dissipated in some form or other. Mr. Lawes, founding on certain experiments which show that plants exhale nitrogen, believes that the nitrogen which has disappeared has actually undergone this process. In doing so (if I do not misunderstand his view), it acts, so to speak, as a carrier of carbon; that is to say, the quantity which passes through the plant stands in a direct relation to the quantity of carbon assimilated and converted into non-nitrogenous compounds, such as starch, &c. Hence the cereals, which contain in their seeds a large quantity of such compounds, require the passage through their system of abundance of nitrogen, and consequently exhaust the soil. On the other hand, the Bean and leguminous plants generally, which yield a seed containing a trifling proportion of carbonaceous compounds, though rich in nitrogen, do not exhaust the soil, because they take only enough of that element to produce their nitrogenous compounds, and do not require that much larger quantity which in other plants is not retained in their system, but is expended merely as a means of causing the accumulation of a sufficient quantity of starch, &c., in their seeds.

Founding upon this view, he points out that the Turnip—which, when grown for its bulb, does not exhaust the soil, because it does not require nitrogen—becomes a scourging crop when grown for seed, which contains a large quantity of oil, and hence requires the expenditure of that element. Ingenious as this view is, I fear it can scarcely be considered as altogether satisfactory. The experiments on the exhalation of nitrogen by plants are too limited and uncertain to serve as

the foundation of such a theory; and the more recent inquiries on the subject throw great doubts on the results of previous inquirers. A very extensive investigation by Knop of the gases evolved by water plants of different species, and under the most varied circumstances, has led him to express the opinion, that the nitrogen evolved is not derived from the organic tissues of the plant, but simply from the water in which they grow. That this is the case appears to be directly deducible from the experiments of Unger, which extend over a large number of plants. He carefully determined the amount of nitrogen given off by a specimen of Cladophora fracta; and comparing it with the quantity of nitrogen gas held in solution in the water, he found the latter to exceed the former. It is therefore unnecessary to assume any decomposition of the tissues as the source of the nitrogen in this case; and though equally precise experiments have not been made with other plants, it has been distinctly made out that the quantity of nitrogen evolved is by no means considerable; nor is it possible to admit, as a general fact, that the Turnip does not require nitrogenous manures. Mr. Lawes' experiments unquestionably give this result; and no one who knows the precision and care with which all his experiments are made, will for a moment doubt that they show the conditions of cultivation required for his own district. But we cannot admit his generalisation. It is very certain that the experience of farmers here is strongly in favour of guano for the Turnip, and guano, too, of the nitrogenous class—the different conditions of climate, no doubt, being the cause of the difference. As a remarkable illustration of this distinction, I may mention a fact communicated to me by an extensive manure manufacturer of scientific acquirements. He manufactures large quantities of superphosphate from coprolites alone, and he assured me that, when sent to the south of England, it invariably gave satisfaction to those who employed it, while the very same substance in Scotland proved unsuccessful, and he had found it absolutely necessary to add a proportion of ammonia, or some other nitrogenous matter, to the superphosphate prepared for the Scotch market. The fact is, that the effect of a manure is not constant and definite, but varies to a much greater extent than we were at one time inclined to admit, under the influence of climate and various other circumstances; and ingenious as Mr. Lawes' idea is, we ought, I think, to suspend our judgment, and await the result of further experiments before adopting it.

This seems the proper place in which to refer to the system of cultivation introduced by Mr. Smith at Lois Weedon, which has recently attracted a good deal of attention. By Mr. Smith's plan, rotation is abandoned, and Wheat grown year after year on the same soil, and without manure of any sort. In order to effect this object, the land is divided into ridges of five feet wide, on each of which three rows of Wheat are sown at a distance of a foot apart. In this way the field forms a series of strips of crop alternating with spaces on which nothing is grown. The success of the plan, according to Mr. Smith, is dependent on the management of the strips of fallow land lying between the spaces under crop, which, by a system of deep forking in the autumn and winter, and by being occasionally worked with the grubber in summer, are kept free of weeds and exposed to the atmosphere. Next year the Wheat is sown upon that which had been fallow the previous season; and so on year after year, alternating always the position of crop and fallow. By this plan Mr. Smith has succeeded in obtaining from each acre, on the average, 30 bushels of Wheat, and sometimes as high as 40; while the same land, cultivated in the ordinary manner, does not yield more than from 24 to 28 bushels. In this method of cultivation we see reproduced the principles which guided old Jethro Tull in his agricultural improvements, and it is peculiarly interesting as a means of impressing on the mind the importance of careful and complete tillage. By the frequent stirring of the soil, and admission of air, the valuable materials it contains are enabled to undergo decomposition more rapidly, and are prevented from falling into that inert condition into which they are apt to pass by its exclusion. No one, now-a-days, questions the effect thus produced; although perhaps much more reliance is placed upon manure than on tillage; and the value of Mr. Smith's system lies in its bringing distinctly before us the importance of the latter. I do not conceive that the method he advocates is likely to come into general use, nor do I think it possible that it can be carried out without, in the long run, impoverishing the land. Conceal it as we may, frequent tillage is only a means of bringing the valuable constituents of the soil rapidly into an available condition; and sooner or later the supply contained in it must be diminished or exhausted. Mr. Smith seems to think that something is absorbed from the air—probably ammonia and nitric acid; but even this would not suffice to counterbalance the loss continually going on. The whole quantity of nitrogen deposited annually by the rain on an acre, in these forms, amounts, as has been stated in a former part of this paper, to 20 lbs.; but a crop of Wheat removes from 50 to 60 lbs. of that element. The whole matter comes to this: there are two methods of increasing the produce of land—tillage and manuring; and that system cannot be a good one which relies upon the one to the exclusion of the other. Both must be employed simultaneously; and in their judicious combination we may expect to find the conditions of the greatest amount of general success. When manure is applied to the land, part of it acts rapidly, and part passes into an inert state; and the consequence is, that, when tillage is deficient, there is a gradual accumulation of these inert matters, from which the valuable constituents of plants may be set free by a change in system. In such cases this matter may be considered as so much capital laid up in a useless state, which may at any time, by proper working of the land, be brought into a useful condition. It is my belief that Mr. Smith is now spending the dormant capital of his land, and that, sooner or later, he will find it requisite to apply manure. The true system of cultivation is surely to make use of manure, and, by proper cultivation, to prevent as far as possible its passing into a dormant state. *Prof. Anderson, in the Transactions of the Highland and Agricultural Society.*

Home Correspondence.

Adulteration of Guano.—Mr. Way tells us that there is no simple and unobjectionable method of determining the question of adulteration in guano. Did he ever have a single sample submitted to him which could not be detected by the simple process of burning? A common tobacco-pipe and a strong fire are all that is required. I send two samples—one pure and the other adulterated to a great extent, which, nevertheless, was sold as guano, and returned in consequence of its being burned by me in a tobacco-pipe in my kitchen fire. I have tested other samples, and never found the fire proof fail; all earths, sand, and the like must be detected by it. The pure guano burns to a white ash and loses two-thirds of its weight in the fire; the ash is the residue of 10 grains of each. *J. C. C.* [The samples are sufficiently distinct and significant.]

Portable Manures, weight per bushel.—In reference to Prof. Way's article, in the *Agri. Gazette* of July 8, on detecting adulteration in guano, it would be doing good service if one or more of the respectable manure dealers would give, through your columns, trustworthy tables of the weights per bushel (imperial strike) of the various portable manures, which seem now to be quoted almost at random; for instance, I have quotations of common agricultural salt, from 60 lbs. to 80 lbs. per bushel; of lime, from 80 lbs. to 96 lbs.—chalk lime, no doubt, under 80 lbs., &c. The relation of weight to measure is important, not only in the purchase but in the application of manure. *J. Prideaux, Plymouth.*

Damp of Limestone Walls Cured.—I have found the walls of every cottage I have yet built damp, although no expense has been spared, and I find that this is a general complaint in limestone districts. This year I am building the walls with a lining of hollow bricks, having an interval between the bricks and the stone walls, and tying the brick lining to the stone walls by brick "headers." I have no doubt this will make the houses quite dry. The expense is not much, and the difference to the health and comfort of your labourers immense. *Somerset.*

Seed Growers' Society.—At your request I beg to hand you a few of the principles of the above Society, also a report from the *Chelmsford Chronicle*, together with the rules for its management. *A Friend of Progress and Freedom.*

Old System.	New Principles.
The London seed merchants have been used to meet (their own body only) for the purpose of determining what price they should fix for such and such articles.	The growers claim the right of having a voice in fixing a price on their own property.
The trade hitherto have secured most of their supply before they would give any idea of what their prices would be fixed at.	The growers have determined not to deliver their goods without first knowing what they are to be paid for them.
The trade has formerly been almost exclusively kept in a state of monopoly, and nearly all articles have been bought up by some 20 or 30 individuals.	The growers will hereafter sell to any party who pays them best for their goods, making it an open market for town and country.
The trade has always by their travellers collected all necessary information for their own guidance, as to the probable yield of the seasons, which the growers have been entirely ignorant of.	The growers have now adopted a plan of returns of acres grown, and probable yield, enabling them to ascertain what ought to be a fair legitimate price between buyer and seller.

Let it be distinctly understood that the object of the Society is justice between producer, merchant, and consumer. "In a former communication it was stated to be the unanimous desire of the growers of seeds to maintain a friendly relationship with the London merchant, at the same time that they expressed their determination to transact business upon a more satisfactory basis. In accordance with this desire, a deputation from the committee of the Society has visited the trade in London during the past and present week, to explain the objects and intentions of the members, and, if possible, to secure their compliance with their propositions, and were gratified at finding them—although naturally leaning to the old system, and wishing to retain the power to themselves—not unwilling to yield to their request, and freely confessing to the fairness of the proposals made. This statement is made with the avowed design of enlisting those who, from fear of injury resulting therefrom, or from an attachment to established customs, have hitherto stood aloof from the Society. The next general meeting of the Society is to be held at the latter part of the month at Kelvedon. The following are the rules of the Society:—

"1. That this Society be called the Seed Growers' Society, and that its object be to protect the interests of the growers of seeds.—2. That the officers of the Society shall consist of a chairman, secretary, and treasurer, and committee, to be elected annually, who shall manage the business of the Society.—3. That the Society shall meet at least three times in each year, or oftener if the committee shall deem requisite.—4. That each member shall subscribe 5*s.* and upwards to the funds of the Society annually, in advance.—5. That notice be given to the secretary of any persons wishing to become members, who will bring their names before the Society at its next meeting, and if approved by the majority be then elected.—That all political questions be totally excluded from the meetings of the Society.—7. That every member be requested to furnish the secretary with information of the probable produce of all seeds, &c., grown by him. The committee being furnished with such information, to call a meeting of the members before seeking an interview with the trade, in order to obtain a fair adjustment of prices.—8. That the general meetings of this Society be held in Kelvedon.—9. That any member wishing for the alteration of any rule must give notice thereof in writing to the secretary, in order to its being submitted to the annual general meeting, to be held in March.—10. That a copy of the above rules be given to every person on becoming a member."

Cattle Pools.—Much of the ill-health of cattle arises, no doubt, from the state of the water they drink. I send you a plan I am going to adopt to economise water, and yet allow the sun always to lie on it. It is, in short, a covered tank with a short "slip," from which the water runs into the tank free from gravel, mud, &c., which injures the water and is expensive to clear out; moreover, it deceives you as to the quantity of water you really have in your pool. When the slip is not full you pump up clean water and expose it to the atmosphere in the slip, which from being always full does not collect dung or weeds between the stones, &c. *Somerset.*

Agricultural Education.—In Lord Ebrington's philanthropic letter on agricultural education, published in the Journal of the Society of Arts, also in the *Agricultural Gazette* of July 10th, he proposes—"That in the chief county town a yearly examination should take place, under the patronage of the lord-lieutenant, county magistrates, or other influential persons connected with the county; at which examination all youth and young men of the county, whose parents or near relations were, or had been, in respectable and independent circumstances, might apply for a "county degree," and compete for "county honours." Why, I ask, this qualification? Would it not be better to grant the privilege of applying for a "county degree" to all young men of good character engaged in agricultural pursuits or employment, without reference to the position or circumstances of their parents or near relations? Surely his lordship would never contemplate withholding the privileges of competing for the proposed "degree" from an enterprising and intelligent youth who might not be able to show that his parents were, or ever had been, in independent circumstances. Nor can he consider it unjustifiable ambition in the son of an agricultural labourer or working mechanic, to aspire to a standard of education becoming an Englishman of the middle class. *G. P.*

Wheat Crop and Thin Seeding.—Since our last report various mishaps have attended the growing crops of Wheat, viz., rust in the blade, which occurred during the cold blasts which prevailed just at the time when the first ears were bursting from their sheaths and coming in blossom, consequently some abortive ears are the result of this; but since that time warm weather has bettered its condition in no small degree. The mould or fungus, which also appeared about the same time at the feet of its stalks, has, by a strong effort in nature, been overcome. Within this last fortnight, however, another visitation is not uncommon, namely, "red gum," and in some places to an alarming extent. Notwithstanding all this, we contend, as before stated, that on the whole, an unusual and abundant crop may be expected, especially where our system of isolating the plants, at an early time, in their thin and regular order has been attended to, some of which may be fairly estimated at from 6 to 8 quarters per acre. A late harvest is now certain, from the unaccountable absence of sun during the whole summer. Our own crop of Wheat, growing on common ploughed land, planted at 1 foot apart, or six pints of seed per acre, we venture to challenge the United Kingdom to produce so good a crop, on the same space of land, from their 128 pints per acre, or 21 plants to the square foot. We also back our Barley at 1 foot asunder, or 8 pints per acre, against any body else's at their 192 pints per acre, or 24 plants to the foot. Instance, numerous ears of Wheat, five, six, and seven set, at 60 to 80 kernels, and 20 to 80 ears on each stub. Also of Barley, the common kind, at 40 grains in each ear, and of a favourite variety averaging 72 kernels each ear, and both kinds 30 ears on each stub, all performing their natural capabilities. *Hardy and Son, Seed Growers, Maldon, Essex.*

Societies.

LINCOLN MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Lincoln, *July* 22.—We understand that this meeting has been a very satisfactory one financially — that upwards of 1200 paid for admission to the yards on Thursday and upwards of 40,000 on Friday, the receipts on these two days therefore amounting to as much as 3500*l.* On Friday morning a meeting of the members took place, for the purpose of winding up the proceedings of the week by votes in acknowledgment of the efforts made by the several local authorities for their reception during the week.

We append further reports on the one class of the horses, and on the pigs exhibited, to which we had not last week space to refer:—

HORSES.

The praise which we have readily bestowed on the cart-horse classes, and to which they are justly entitled, we can by no means offer without reservation to the

lighter horses. In addition to the prizes offered by the Society for the best stallion for getting roadsters, local prizes were given by the Mayor of Lincoln for the best stallion for breeding hunters, as also a separate class for the best and second best three-year-old hunting gelding or filly.

With regard to the roadster stallions, we could scarcely discover a perfect hack of suitable size and substance amongst the whole list. The best in shape appears to be an old brown horse (No. 242) of the Fireaway breed, too infirm from diseased feet to enable us to judge of his action, except from his conformation, and he appeared to have been equal to weight as well as another horse, 246, similar in colour; the latter, however, was somewhat too heavy, and exhibited one of the faults that could scarcely be forgiven, viz., a blemished knee. The prize was awarded to No. 240, a bay horse belonging to Mr. Joshua Innocent, a good-shaped animal, and equal to some weight. A clever cob or pony (No. 237) was worthy of notice, and possessed superior action; and also a handsome iron grey, belonging to Mr. Askew, though probably not adapted to carry weight. A perfect hack should, in our opinion, be able to carry weight, and with it walk four or five miles or trot 14 miles within the hour, with comfort to his rider and ease to himself. We observed a young horse at the Saxmundham show, a short time since, the son of Phenomenon, a Norfolk trotter, that could evidently do this or more, and which we prefer to any horse of the kind we found at Lincoln.

In the special class, viz., stallions for getting hunters, we anticipated much from the liberal prize of 40*l.* offered by the Mayor of Lincoln, and which was awarded to No. 721, a 19-year-old thorough-bred brown horse, apparently perfect in all respects with the exception of having crooked legs—a grievous fault, but one which the great age and high breed of the horse somewhat mitigated; for it is a fault derived from high blood and the system of breeding the fastest horses for the turf irrespective of any other consideration. The straighter the action and the nearer the horse goes to the ground the better for this purpose, and a bent leg often co-exists with great speed, and indeed is no disparagement to it, although anything but desirable in a hack, or a favourable conformation in a hunter when landing from a high leap with a heavy weight on his back. The commendation was given to No. 722, a good shaped half or rather three-parts bred chesnut horse, possessing much substance, and equal to a fair amount of weight, the property of Messrs. Marfleet. Such a horse as this would be extremely useful in many parts of the country, in the place of the weedy thorough-bred horse that is too frequently found.

Two prizes were given in the next class, which was open to both mares and geldings three years old. There were several nice animals in this class, though none of them adapted to carry much weight. The prize was awarded to a brown gelding, No. 732, belonging to Mr. Stockdale, a well-bred fashionable animal that will no doubt carry a light weight well to hounds. The 2d prize was given to No. 728, a chestnut gelding with Arab blood, belonging to Mr. Marriss, a neat clever animal with a somewhat better forehand than the first prize horse, and equal to rather more weight, but his appearance was somewhat marred by an indifferent tail. There were several promising animals also exhibited in this class.

PIGS.

The show consisted of 59 boars, 68 sows, and 10 pens of three each, being a total of 157 animals beside young ones. But though this great collection included some beautiful specimens of small-breed pigs, and a few examples of colossal proportions and amazing fatness, the general character of the show as to quality is certainly a little below what it has presented in some former years. There are 54 exhibitors, from all parts of the kingdom; but as the county in which the show is held is not celebrated above others for its hogs, we find only six Lincolnshire exhibitors, only two obtaining commendations, and none any prize.

Class 1. Boars of a large breed: The prize boar of Mr. H. Blandford, of Sandridge, Wilts, is very large, and with not very fine quality of flesh. He is 2 years 3 months and 2 weeks old, a pure Berkshire black, with white face and feet. The 2d prize hog of Messrs. M. Harvey and J. Branston, of Langford, Nottinghamshire, is of great size and fine quality, but immensely fat. He is 2 years 11 months and 2 weeks old, white, with small breed character. The white boar of Mr. F. Frudd, of Bloxholm Moor, Lincolnshire, 74 stones live weight, is highly commended. Mr. Dyson, of the Firs, Finsley, near Sheffield, shows a hog 3 years and 11 months old, having a tremendous frame, and legs pretty nearly as strong as those of the Devon heifer.

Class 2. Boars of a small breed: Mr. W. Northey, of Lake Lifton, Cornwall, takes the prize, for a black boar of the improved Leicester breed, 1 year and 3 months old, of very good quality, and thick compact form. The 2d prize boar, 1 year and 2 months old, of Mr. S. Ashton, of Manchester, is a beautiful animal, a pure small-bred pig, white, with blue spot. Besides Mr. Druce's boar, highly commended; and Mr. Northey's and Mr. Turner's, commended, we particularly noticed a 2 years 6 months and 2 weeks old, of Mr. G. Mangles, of Givendale, Yorkshire, very large, but still quite in character; also a very superior animal, between 5 and 6 years old, of the Coleshill breed, belonging to the Earl of Radnor.

Class 3. Breeding sows of a large breed: Mr. E. Robinson, of Green Bank, near Lymm, Cheshire, obtains the prize for a sow of the large Cheshire breed, 2 years and 2 months old. This animal is of amazing length—measuring 10 feet long, and has very deep sides and good quarters. The distinction of "highly commended" is bestowed upon the sows of Mr. Wainman, of Carhead, near Leeds, and the Rev. E. Elmhurst, of Shawell Rectory, Leicestershire; a commendation is also awarded to Mr. Horsfall, of Burley Hall, Yorkshire. But we were more especially pleased with the fine-qualitied sow of Mr. M. Cartwright, of Stanton Hill, near Burton-on-Trent; with the great height and depth of carcase marking one of the sows exhibited by Mr. T. Craven, of Manningham, near Bradford; and by the good hand and remarkable quarters of another shown by the same gentleman, which was not so much overfed as many of the animals exhibited.

Class 4. Breeding sows of a small breed: This class is so excellent in quality as to have merited a general commendation from the judges, who must have had some little difficulty in coming to a decision with their various awards. Mr. Mangles's prize sow, 2 years and 4 months old, of white Yorkshire breed, is of considerable size, with wide back, and of fine feeding quality. Mr. Northey's 11 months old Improved Leicester sow, highly commended, and his 1 year and 3 months old sow, commended; are both very superior, well-made, thick and deeply formed, and of prime quality. Mr. Horsfall's sows attracted our attention, from their beautiful form and uniformly good quality. Mr. Mangles has also a sow commended.

Class 5. Three breeding sow pigs of a large breed: The prize is awarded to Mr. W. J. Sadler, of Bentham Purton, near Swindon, for a pen of 7 months and 1 day old pure Berkshire; certainly very fine and well-bred specimens, possessing several important points in perfection.

Class 6. Three breeding sow pigs, of a small breed: The prize is taken by the Earl of Radnor, for three of his lordship's well-known animals—a very useful, beautiful, and valuable breed; and those exhibited are well worthy the honour they have received. A pen of sow pigs, 7 months and 6 days old, of Mr. J. Greetham, of Wragby, Lincolnshire, was commended—certainly of great size for their age, but of second-rate quality.

It is to be regretted that so many exhibitors should continue to feed up their animals to such a state of obesity as must unfit many of them for breeding purposes. Let the judges always bear in mind that the society offer their premiums strictly for breeding stock—not for animals crammed up to the utmost stretch of fatness, unable to make proper use of their limbs, and scarcely capable of unimpeded respiration.

HIGHLAND AND AGRICULTURAL.—*Half-yearly General Meeting, July* 19.—Earl of Rosslyn in the chair. One hundred and fifty-two new members were elected.

Agricultural Statistics for Scotland.—Sir John M'Neil said—The Society are aware of Government having resolved to extend the inquiry as to agricultural statistics over the whole country. The secretary has accordingly been actively engaged in making the preparation necessary to carry that object into effect. In consequence of no fault of ours, however, the authority to commence proceedings in the matter was not given until after the beginning of May, and after that authority had been given, there were a great number of preliminary matters to be arranged before schedules could be issued. One of the first and most important of these preliminary matters was to obtain a list of all the occupants of land in Scotland. That was not a very easy thing to arrive at, and various modes were suggested for accomplishing it. At length the secretary himself learned that he might possibly be able to obtain the necessary information through the assessors for the property and income tax. That led to a negotiation with the Department of Inland Revenue, and which the Secretary has successfully carried out; and he is now in progress of receiving, through that channel, the names of the various occupants in different parts of Scotland. Up to this date the names of 35,000 occupants of land, to whom schedules would have to be issued, have been returned. But that was not the only preliminary matter which he had to attend to; it was necessary also that he should make arrangements for dividing the whole country into districts, for the purposes of the inquiry. To accomplish this, it was necessary that he should communicate with the most intelligent persons connected with agriculture in all parts of the country. In doing so, he was not content with mere communication by letter, but, with his usual zeal and energy, he has visited the greater part of the country, for the purpose of communicating with the parties themselves; and I am happy to have to report to the Society that he has succeeded in making a satisfactory subdivision of the provinces he has visited into districts, suited for the purpose. It was also necessary that, with reference to these districts, enumerators should be selected and committees appointed. That also has been accomplished. Enumerators have been selected and committees have been named for the districts; and it is very satisfactory to have to report that, out of 260 replies to applications made to individuals with the view of inducing them to represent their various parishes in the committees, 245 have been in the affirmative, while, in almost every instance in which the duty was declined, an intelligent and satisfactory reason was given for declining it; and, in a good many instances in which parties themselves were not prepared to undertake the duty, they suggested other persons well qualified for the work. So soon as the list of occupants has been received, I presume the secretary will be ready to issue the schedules. I have only, therefore, to congratulate the Society on the successful progress, so far as it has yet gone, of the enterprise in which we are engaged; and in doing so I would not be doing justice to the gentleman on whom the burden of working this scheme has chiefly fallen, if I did not direct the attention of the Society to the remarkable tact, energy, and ability which have been displayed by the secretary in conducting these proceedings.—The Secretary said that the work of subdividing the country into districts, and appointing local committees, had been satisfactorily accomplished for about two-thirds of the counties of Scotland; and from the experience which he had had of the readiness with which the farmers of Scotland had offered their co-operation in the work, on hearing the matter explained, he had no doubt of being equally successful in making similar arrangements in those parts of the country which he had yet to visit.

The Berwick Show.—The Secretary stated that he had to report the very satisfactory nature of the arrangements for the meeting at Berwick. The programme of the proceedings was as follows:—Monday, the 30th, will be devoted to placing implements, and Tuesday, the 1st August, to their inspection by the judges; on the morning of Wednesday the 2d, a trial of implements at the farm of Castlehill, about a mile from Berwick, on ground granted for the purpose by Mr. Laurie, the tenant; on the forenoon of Wednesday, the yard will be opened for the exhibition of implements. On Thursday, the 3d, the stock will be placed and judged in the morning, and the public admitted to the yard between 11 and 4 o'clock. The banquet will take place in a marquee fitted for 600, furnished by Edgington, of London, and erected in an inclosure placed at the Society's disposal by Messrs. Can and Darling. He concluded by reminding members who wish to avail themselves of their new privilege of free admission to the show-yard, that application for tickets must be made at his office not later than the 25th of July, as it was impossible to give free admission at the gates to every one representing himself as a member of the Society.

The Chemical Department.—Professor Anderson said—I am glad to say that I can report satisfactorily as to what has been done in this department. As usual, we have had a great number of analyses to make for various parties—the spring half-year being generally that in which the greater part of such work is done. I regret, however, to say that this year we have had more than the usual number of adulterated guanos to analyse—the increase of price having, I presume, encouraged the adulterator to a considerable extent. Owing to this being our busiest half-year in conducting analyses for the members of the Society, less than the average amount of work had been done in promoting investigations for the benefit of the Society; but in this respect also we have been by no means idle. A considerable number of analyses have been completed on several subjects, which will be prepared for publication shortly. As regards work in hand, I may mention that we are about to enter on the investigation of the composition of the Turnip in relation to its specific gravity. This subject is one which the Marquis of Tweeddale has particularly directed his attention to. He has carried on the general investigation of the properties of the Turnip so far as could be done, and there now only remains the chemical part of the enquiry. The results of the investigation, I may say, will be of high practical importance.

Further reports, for which we have not room, were read on the National Industrial Museum to be established in Edinburgh; on the Geological Survey of Scotland; and on the Shows of 1855-6.

Reviews.

The Journal of Agriculture, and the Transactions of the Highland and Agricultural Society of Scotland. July, 1854.

THE current number of this Journal contains papers by Mr. M'Lagan, on Cotton Seed as Cattle Food; by Mr. Russell, on Italian Irrigation; by Mr. Burns, on the Steam Engine; by Dr. Voelcker, on the Composition of Rye and Rape; with shorter articles on Clover, oleaginous plants, &c. The Transactions of the Society published in this part include papers by Sir J. S. Forbes, G. W. Hay, of Roxburghshire, and Professor Anderson, on Agricultural Meteorology, Manure-effects, and Agricultural Progress respectively. We refer at present to the second of them alone, and that for the purpose of calling attention to the extent of adulteration which analysis proved in the manures that were tested.

"The manures experimented with were—1, B. manure; 2, G.S.P. manure; dung; 3, Latham Island guano; 4, Patagonian; dung; 5, Monte Video; 6, Saldanha Bay; dung; 7, Peruvian; 8, Sharks Bay; dung; 9, Bolivian; 10, patent manure; dung; 11, superphosphate of lime; 12, mixed B. and G.S.P. manures; 13, recent guano from henhouse; 14, Saldanha crusts; 15, Latham Island and Saldanha crusts mixed. I append a sheet of the analyses of the greater number of manures made use of. How far the guanos came up to their analysis, it is impossible to say; but it will be seen from the analysis of the superphosphate of lime, which was made for me, that it only contains of soluble phosphate of lime 4.0, and of insoluble phosphate of lime 46.0. Of the two first articles I had no analysis, nor is there any given, which is highly commendable in all dealers, as

the article may be anything or nothing in that case, without reflections being raised from off the buyer's own shoulders; however, with regard to these, no doubt seems to attach to any of them, as, with the exception of the Patagonian and Bolivian guanos, they rank highest on the list. The quantity of each of the manures to the quarter of acre was 1 cwt., to which were added 84 lbs. of gypsum, 28 lbs. of animal charcoal, and 28 lbs. of salt, thus giving 4 cwt. of guano or special manure, 3 cwt. of gypsum, 1 cwt. of animal charcoal, and 1 cwt. of salt to the acre, or 9 cwt. of all combined. The portions dunged received of superior and well-rotted farmyard manure fully 4¼ tons each quarter of acre. The animal charcoal, I fear, was not quite what it ought to have been, as I was offered, by the parties from whom I got it, a quantity of stuff to which was given the name of London night-soil; but which, on being analysed, turned out to be, in the words of the chemist, remarking upon the products, 'seemingly the scrapings of the streets, with a little limestone and salt.' As to the gypsum, it was far from being genuine; for instead of being pure sulphate of lime, it contained 40 per cent. of sulphate of baryta, which, even though it were beneficial for the soil, raises the price of the gypsum beyond the legitimate value, from its being so heavy, as its name implies. I may be excused entering so fully into the adulteration of our manures, as it is a subject upon which all of us feel very sore, I have no doubt, and one for which there does not seem to be at present a sufficiently ready remedy. We are now so dependent upon special manures, and our gullibility is so well known, that I do not in the least doubt but that many good-going businesses have been, are, and will continue to be, opened and supported by the farming community of Great Britain, to the aggrandisement of the trader in these spurious articles, and the loss of the purchasers; and when treating of another field, it will be shown by analysis how far we are imposed upon."

In addition to the above-named manure, certain chemicals were purchased and used upon a field sown with white Globe Turnips, for the purpose of testing the qualities of each respectively.

"This object, however, it will be seen, has been entirely frustrated, for the very obvious reason that none of the ten manures I had sent to me as genuine articles turned out to be anything at all like what they are represented to be, with the exception of two. The chemicals I asked for were the following:—1, nitrate of soda; 2, carbonate of potass; 3, sulphate of magnesia; 4, muriate of ammonia; 5, sulphate of potass; 6, carbonate of soda; 7, nitrate of potass; 8, sulphate of ammonia; 9, phosphate of magnesia; and 10, phosphate of soda. I append a list of the analyses of these substances, and it will be seen from it that the genuine articles were, carbonate of potass, which was pure, and the carbonate of soda, which was a pure bi-carbonate, and of course more expensive than I intended. The phosphates of magnesia and soda I was prevented from using at all, from their impurities, the phosphate of magnesia only giving 2.8 per cent. of phosphate of magnesia, and the phosphate of soda only 6.0 per cent. of phosphate of soda. From the appearance of those two substances, I feared that they were not correct; and an analysis having been obtained of all of them, I wrote to the party who had procured them for me, and who unfortunately had paid for them even before they had come into my possession, stating that they would not suit my purpose, and requesting that genuine substances might be sent in their place, otherwise I would return those I had, and that the money must be given back. The reply which I received from the house furnishing the articles was to the effect, 'I must certainly decline receiving back the manures; they are the usual quality for agricultural purposes, (for which purpose I only manufacture chemicals). Mr. ——— bought them at the usual price-current handed to him. The foreign ones, viz., nitrates soda and potash, and carbonate of potash, are exactly as imported, and the others contain the quantities respectively as are suitable for plants.'

"'Suitable for plants.' It does appear unsuitable certainly that the farmer is to be dictated to by the manufacturers of manures in what is suitable for the growth of his plants. This is in plain language telling the agriculturist that he knows nothing of his own business, and must be kept right by the manufacturer, even though that manufacturer does not even know beforehand for what purpose those manures he is furnishing are required. In consequence of this letter, I wrote to him, giving him some farther time to furnish me with genuine articles that I might proceed with the experiments, and even delayed sowing the field for some time beyond the limited period, hoping that they would be sent; but, as they were not forthcoming, the field was sown, keeping each kind by itself, adding to each a proportion of guano, gypsum, charcoal, and salt, that the crop might not be entirely risked."

We add the analyses of the chemical manures employed, and it will be seen how, with two exceptions, the materials supplied have been among the most glaring instances of barefaced fraud that have been published.

Analysis of different kinds of Chemical Manures.

Carbonate of Soda—a pure bi-carbonate.

Nitrate of Soda.

(Signed) Andrew Fyfe.

It seems a monstrous thing that farmers should be thus imposed on. Mr. Hay must not, however, complain of his case being without remedy, until he has brought it unsuccessfully before a court of law.

Poultry.

Lincoln Meeting of the English Agricultural Society.—The following is the prize list postponed from last week:—

Judges—Messrs. G. J. Andrews, John Baily, and Thomas Barber Wright.

Class 1. Dorking Fowls (Cock and two Hens), Chickens of 1854: 5*l.*, to H. D. Davies, of Spring Grove House, Hounslow; 3*l.*, Do., do.; 2*l.* to Joseph Smith, of Henley in Arden, Warwick; 1*l.*, to James Lewry, of Handcross, Crawley, Sussex.

Class 2. Dorking Fowls, more than 1 year old (Cock and two Hens): 5*l.*, to H. D. Davies; 3*l.*, to Mrs. Towneley Parker, of Astley Hall, Chorley; 2*l.*, Do., do.; 1*l.*, to G. A. Gelderd, of Aikrigg End, Kendall.

Class 3. Dorking Cocks of any age: 2*l.*, to G. A. Gelderd; 1*l.*, to Mrs. Towneley Parker.

Class 4. Spanish Fowls (Cock and two Hens): 5*l.*, to H. D. Davies; 3*l.*, to George Botham, of Wexham Court, Slough; 2*l.*, to H. D. Davies; 1*l.*, to G. A. Gelderd.

Class 5. Spanish Cocks of any age: 2*l.*, to James Dixon, of Westbrook Place, Bradford, Yorkshire.

Class 6. Cochin China Fowls (Cock and two Hens), Chickens of 1854: 5*l.*, to G. A. Gelderd; 3*l.*, Do., do.; 2*l.*, to John Taylor, jun., of Spring Grove, Hounslow; 1*l.*, to William Sanday, of Holme Pierrepont, Nottingham.

Class 7. Cochin China Cocks of any age: 2*l.* to Caborn Pocklington, of Boston, Lincolnshire.

Class 8. Bramah Pootra Fowls (Cock and two Hens): 2*l.* to the Rev. F. Thursby, of Abington Rectory, Northampton.

Class 9. Game Fowls (Cock and two Hens): 5*l.* to Henry Worrall, of Knotty Ash House, near Liverpool; 2*l.* to G. C. Adkins, of West House, Edgbaston, Birmingham; 1*l.* to William Cox, of Brailsford, near Derby.

Class 10. Game Cocks of any age: 2*l.* to Henry Marshall, of Cotgreave, Nottingham.

Class 11. Hamburgh Fowls—Golden Pencilled (Cock and two Hens): Prizes withheld.

Class 12. Hamburgh Fowls—Siver Pencilled (Cock and two Hens): Prizes withheld.

Class 13. Hamburgh Fowls—Golden Spangled (Cock and two Hens): 2*l.* to William Sylvester, of Stamp Office, Lincoln; 1*l.* to John Andrew, of Waterhouses, Ashton-under-Lyne.

Class 14. Hamburgh Fowls—Silver Spangled (Cock and two Hens): 2*l.* to James Dixon, of Westbrook Place, Bradford; 1*l.* to Jeffrey Ashcroft, of Waterloo, Ashton-under-Lyne.

Class 15. Malay Fowls (Cock and two Hens): 2*l.* to James Oldham, of Long Eaton, Derby; 1*l.* to the Rev. T. Lyon Fellowes, of Beighton Rectory, Acle, Norfolk.

Class 16. Poland Fowls (Cock and two Hens): 3*l.*, to G. C. Adkins, West House, Edgbaston, Birmingham; 2*l.*, Do., do.; 1*l.*, to C. Rawson, of the Hurst, Walton-on-Thames.

Class 17. Turkeys (Cock and two Hens): 3*l.*, to Viscount Hill, of Hawkston, Shrewsbury; 2*l.*, to C. Pocklington, of Boston, Lincoln; 1*l.*, to H. Lister Maw, of Tetley, Crowle, Lincoln.

Class 18. Geese (Gander and two Geese): 3*l.*, to Mrs. Towneley Parker; 2*l.*, to Mrs. Harriet Hill, of New House, Walton-on-Thames; 1*l.*, to Christopher Rowson.

Class 19. Aylesbury Ducks (Drake and two Ducks): 3*l.*, to W. G. K. Breavington, of Vicarage Farm, Hounslow; 2*l.*, to H. D. Davies; 1*l.*, to G. A. Gelderd.

Class 20. Rouen Ducks (Drake and two Ducks): 3*l.*, to George Botham, of Wexham Court, Slough; 2*l.*, to Thomas Teanby, of Ulceby Hall; 1*l.*, to Charles Punchard, of Blunt's Hall, Haverhill, Suffolk.

Class 21. Ducks of any other variety (Drake and two Ducks): 2*l.*, to Henry Worrall, of Knotty Ash House, near Liverpool; 1*l.*, to T. M. Keyworth, of Cottesford Place, Lincoln.

Carriage of Eggs.—I observe by a writer in your last number, under the signature "D. J.," that he has succeeded in conveying eggs to America in so perfect a state as not to destroy their vitality, and am much pleased with the result, and would feel obliged if he would minutely describe the means by which he accomplished it. I have tried the experiment but have not succeeded, and have been assured by what is termed "high authority," that it was impossible to succeed. In my last attempt I packed the eggs of the black Spanish fowls and English song birds in pulverised charcoal, but though those we broke appeared perfectly fresh, the rest became putrid under the process of hatching. *T. S. W.*——We have also received the following:—It is a disputed point how long eggs will retain vitality, and the following instance may interest your readers. On the 12th ult. I received by steamer from New York, a box containing a dozen of Bramah Pootra eggs, packed in sawdust. They were sent from a friend resident 80 miles up the Hudson, and from the dates upon them had been laid from 17th to 25th May. They were not set until the 25th ult., being then from four to five weeks old, and I had six chickens hatched on the 15th inst., all strong and healthy. *J. B., Liverpool, July* 18.

Miscellaneous.

Cost of fixed Threshing Machines.—Mr. Bridges writes, "I have divided the dressing apparatus from the mill; and were hummellers and foul-spout elevators deducted, so as to form a mill still extensively used, the price would be reduced, say 16*l.* The mill and dressing apparatus will be understood to prepare the grain ready for measuring up; at the same time it is not so well done as when finished by hand-labour on the old system."

Horse Power	Price of a fixed high-pressure Steam Engine.	Price of Mill with Hummeller and foul-spout Elevators.	Dressing Apparatus including 2 Winnowing Machines, with Elevators.	Converting Horse-course into Engine and Boiler House, in ordinary cases.	Cost of a New Engine House and Boiler House, in ordinary cases.
	£	£	£	£	£
4	90	60	32	50	76
5	100	65	35	55	83
6	110	70	35	60	90

Average of repair for engine for first 19 years, under good management, per year, 2*l.*

For mill, per year, 2*l.*

From the Report on the Farming of East Lothian, by Mr. Stevenson, in the Eng. Ag. Soc. Journal.

Calendar of Operations.

JULY.

Border of the Fens, *July* 24.—More than ordinary attention is attracted to the Wheat crop, which has now arrived at the important turning point which seems to determine its comparative value for the current season, the flowering period is over without any severe trial from wind or weather, the kernel swells under a more than usual amount of sunshine, the straw is generally erect and unbroken, and though in most instances rather thin on the land, yet the rows of chaff are of the full complement, and the ears well-formed and complete. We have not observed any instances of its ripening prematurely, therefore bold and heavy samples may be expected to prevail, and if ever thin sowing is to commend itself, this year's growth may furnish examples of large produce from thinly distributed stems, as, from the dryness of the spring, less "tillering" took place than usual, and at no time has the plant been pushed with too much rapidity, as is frequently the case if warm moist weather prevails before the appearance of the ear. Should, however, the present remarkably fine weather continue, to the shearing, the advocates of thick sowing may appropriate no small confirmation of the advantages of their system, as shown by the few really heavy crops surviving the blight which threatened them about a fortnight since; at this moment they look almost as bright and perfect in the undistinguishing crowd of their heads, as in the thinner fields where the drills may be yet traced, and where the stems are seen as plainly as the corn. Birds are this year extremely troublesome amongst the Barley, every forward crop of which gives proof of their ravages in brown spiry-looking straws, showing themselves divested of every kernel by the sparrows. Serious losses are sustained in this way among cottagers' allotments, the occupiers of which should club together to employ an active scarer with a gun. Complaints are universally made of the scantiness of the hay crops, as well as of the shortness of keep in pastures; the Tare crop has, therefore, been of great value, as in many cases foddering stock has not been a matter of choice; the scarcity of pasture feed threatens to be followed by a scarcity of water, as the "socks" are extremely low. From these causes a more than usual quantity of beasts have been drafted out for market before maturity to relieve the wasting Grass from being overstocked; this circumstance and the high price of Linseed-cake in prospect, will place the English cattle dealer at a disadvantage, if the price of meat should even hold up fully to the present rates. As to the consumers of meat, there is every chance of their being compensated by a probable abundance of corn and Potatoes, which will at least ensure a plentiful subsistence for the whole population on a moderate scale of prices. *J. W., Peterborough.*

Wester Ross, *July* 22.—The Potato disease has made its appearance unmistakeably in different fields within these few days. The fields attacked are the farthest advanced, and more luxuriant ones. Its progress seems to be rapid, commencing in one spot, and spreading all around. The leaves are quickly withered away, leaving the stems blackened, as if fire had passed over them. Should it become general at this early season, it would go far to extinguish them altogether.

West Sussex, *July* 25.—The appearance of the crops has changed very fast, and we shall have harvest much earlier than was expected; I believe it will be general by the end of next week. There is, no doubt, a little rust in the Wheat, but, for all that, we shall have a fair crop, perhaps above an average. Barley has improved very much, and with this forcing weather will come more equally to harvest. Oats are generally a good crop; Peas have done well, and will be fit to cut this week in some places. Beans here are a fair crop, but there is a little blight in patches, which showed itself about three weeks ago, but has not got worse since that time; but we hear they are very bad in some places. The season has been very favourable to Turnips, both sowing and hoeing, and they are generally a promising plant' very few have had to be sown more than once, and they are well advanced, and the weeds have been well kept under. So with Mangold, but a good shower would do them all good. Hay-making has been finished, and made pretty well, but is a very light crop and will be scarce next winter; but if we have a fine harvest, the Barley and Oat straw will be a better substitute than last year. We are now getting the dung in a forward state for Wheat, and when the Peas are off we shall have to clean the land as soon as possible, and if convenient, sow Rape, which will come up soon enough either to be fed off or ploughed in, and in the latter case it serves well on this heavy land in keeping the soil open, thus giving the Wheat a more healthy and open bed during the winter; and we have little doubt but that it will benefit the Wheat more when ploughed in than when fed off. The work of cleaning will be easier than usual, as the land has not got hard and the weeds are not so many as for some years they have been. The scarifier applied twice, once with the sharp tines, and then crossed with the broad shears, with Howard's drags to follow, will bring all the rubbish to top and leave a finely pulverised soil for the Rape, and save so many ploughings as are common when preparing Pea-stubble for Wheat, and that too at a season of the year not well adapted for working fallow land. *G. S.*

Notices to Correspondents.

Ashes: *B A.* You had better keep the ashes in heaps, and not spread them till a few weeks before you hope to see their effect.

Davis' New Vetch: *July* 19. We have received a fine sample of already ripe seed.

Damp Hay: *Monday.* We were quite aware of its being a republication.

Drains: *Mr. Moodie.* Pipes of 1½-inch bore are large enough for the parallel drains 30 feet apart, of the largest fields, say 300 yards; and pipes of 4-inch bore are large enough for the main drains of 10 acre fields. It would not be possible to answer as definitely as you seem to desire.

Produce per Acre: *C D.* You want us to state the dream as well as the interpretation. How is it possible to form an opinion of the produce of grain without seeing the crops? Valuers of growing crops form a guess, guided by the experience of past years; valuers of crops in the rick—either thresh part or all.

THE ADVANCE OF SCIENCE IN AGRICULTURE.

RICHMOND AND CHANDLER'S unprecedented celebrity for their improved CHAFF MACHINES and CORN CRUSHERS, achievable only by intrinsic merit, has secured for them the highest character in the trade, together with the confidence of the public, whether as regards true economy or the unapproachable finish and sterling quality which characterise all their productions, and render them worthy the reputation of a Manchester manufacturer.

The most distinguished authorities in all civilised countries report their unqualified satisfaction with the highly beneficial effects resulting from the use of these justly celebrated Machines, and with the now established fact of their not being subject to any of the contingencies inseparable from other machines, they are calculated to meet with general approval in the present advancing state of agriculture.

Address—RICHMOND & CHANDLER, Salford and Manchester; and 32, South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds	10 gallons,	throws	30 feet high	...	£4	10
No. 2	15		45	...	5	10
No. 3	28		45	...	6	18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8 gallons,	throws	25 feet high	...	£2	15
No. 13	12		30	...	3	5
No. 11	16		40	...	4	0
No. 12	24		45	...	5	0
No. 14	30		45	...	5	18

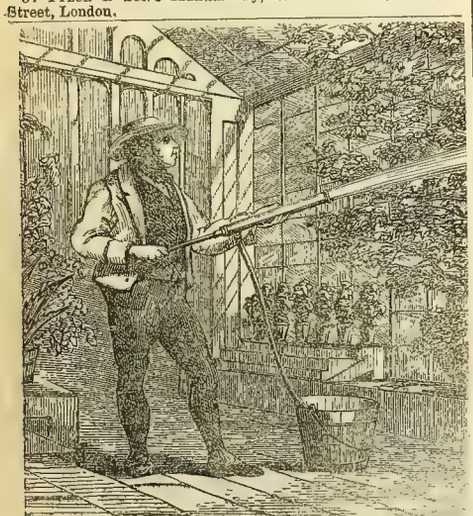
A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21*s.*** each; Large size, for Gardeners' use, **25*s.*** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is pertectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

Garden Engine, with WARNER'S Registered Spreader and Wrench 31.1 with iron pail, 3*l.* 12*s.*
Patent Conservatory Pump, with WARNER'S Registered Spreader, 2*l.* 13*s.*; with iron pail, 3*l.* 5*s.*
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

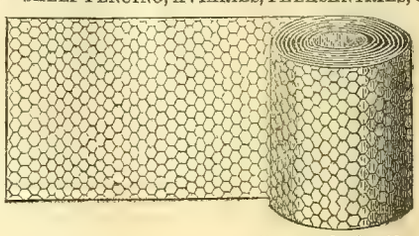
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.



Two-inch mesh, light	...	6*d.* per lineal yard	2 ft. wide.
" " strong	...	8*d.*	" "
" " extra strong	1*s.*	"	"

Any size or quantity made to order on the shortest notice. Special Estimates given for large quantities.

GEORGE CASTON AND CO., Wholesale Wire Netting Manufacturers, Howard's Buildings, Brick Lane, St. Luke's, London. Orders by post punctually attended to.

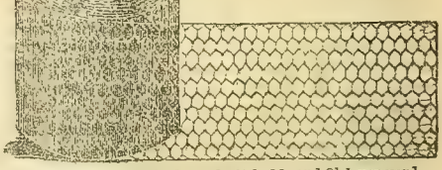
GALVANISED WIRE GAME NETTING.— 7*d.* PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7*d.* per yd.	5*d.* per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.

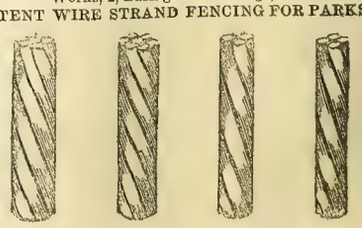
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.



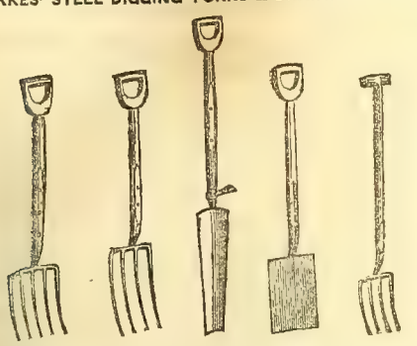
This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



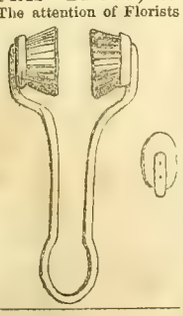
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

BARTON'S PATENT STABLE FITTINGS AND ENAMELLED MANGERS.—These Fittings have all the newest improvements and are the only patented invention of this description.
JAMES BARTON, Iron Founder, Smith, &c., 370, Oxford Street, a few doors East of the Pantheon.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

IMPORTANT TO GROWERS OF ROSES.

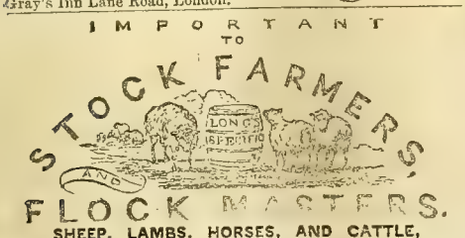
NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage. Price 2*s.* 6*d.* each, or free by post, 4*s.*



MANUFACTURED BY
JOSLIN AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.
Wholesale agents: W. Thompson and Son, 15, Upper North Place, Gray's Inn Lane Road, London.

IMPORTANT TO



SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.
Contracts given for Heating.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE COMFORT OF A FIXED WATER CLOSET for 1*l.*—Places in gardens converted into comfortable water closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Indispensable for the health and comfort of a family. Hermetically sealed Inodorous Chamber Commodes, 1*l.* 4*s.*, 2*l.* 6*s.*, and 3*l.*; also, Improved Portable Water Closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE and Co.'s, removed to more commodious premises, at 46, Leicester Square, London.

FOR HOT OR WET WEATHER.

BERDOE'S LIGHT SUMMER COATS, of superior description, at lowest charges, a large Stock for selection; also of the well-known Ventilating Waterproof Light Coats, Capes, Shooting Jackets, &c., with Mantles, Habits, &c., for Ladies; all effectually resist any amount of rain, without confining perspiration.—W. BERDOE, Tailor, 96, New Bond Street, and 69, Cornhill (only).

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

DEAFNESS.—NEW DISCOVERY.—The Organic Vibrator, an extraordinarily powerful, small, newly invented instrument, for Deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be produced; being of the same colour as the skin is not perceptible. It enables deaf persons to hear distinctly at church and at public assemblies; the unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles. The most powerful Patent Telescopes, possessing such extraordinary power, that some, 3½ inches, with an extra eye-piece, will show distinctly Jupiter's Moons, Saturn's Ring, and the Double Stars. Opera, Camp, Race-course, and Perspective Glasses to know the distances. Also a very small, powerful, Waistcoat Pocket Glass, the size of a walnut, to discern minute objects at the distance of from four to five miles.—S. & B. SOLOMONS, Aurists and Opticians, 39, Albemarle Street, Piccadilly; observe, opposite the York Hotel.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure, and will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct, the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double Rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, cash, or Post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 3 o'clock. A Pamphlet of Testimonials sent post free on receipt of one postage stamp.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 17*s.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21*s.*; and Cots from 21*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 19*s.* to 13*l.* 13*s.*

BATHS AND TOILETTE WARE.—WILLIAM S. BURTON has ONE LARGE SHOW ROOM devoted exclusively to the DISPLAY of BATHS and TOILETTE WARE. The stock of each is at once the largest, newest, and most varied ever submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Portable Showers, 7*s.* 6*d.*; Pillar Showers, 3*l.* to 5*l.*; Nursery, 13*s.* 6*d.* to 32*s.*; Sponging, 15*s.* to 32*s.*; Hip, 14*s.* to 31*s.* 6*d.* A large assortment of Gas Furnace, Hot and Cold Plunge, Vapour, and Camp Shower Baths. Toilette Ware in great variety, from 15*s.* 6*d.* to 45*s.* the Set of Three.
WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the stock of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.
Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.
39, OXFORD STREET (corner of Newman Street); Nos. 1, 2, and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

KNOW THYSELF.—Persons desirous of knowing the gifts, defects, talents, tastes, affections, and other characteristics of themselves or any friends in whom they are interested, must send a specimen of the WRITING, stating sex and age (including 13 penny postage stamps) to MISS GRAHAM, 3, New Road, Hornsey, Middlesex, and they will receive a minute graphiological delineation, written in a style peculiarly her own. Testimonial from W.R.: "Having seen several of your pourtrayals of character, and being much struck with the forcible truths contained in them, I should like your opinion of mine."—Miss H. S.: "Your delineations are most faithful."—Miss Grove: "Your letter gave great satisfaction."—Miss Rosa C.: "Accept my sincere thanks for your advice. I was exceedingly doubtful of him."

SOUTHDOWN RAMS.

MR. R. H. ELLMAN informs his Friends that his RAMS are now ready for Letting or Sale. The Rams may be seen and terms known at any time.—Landport, Lewes.

TO BE LET ON LEASE, with immediate Possession, or at Michaelmas, an excellent FARM, containing 130 acres of Arable Land, situate midway between Guildford and Farnham, 1¼ mile from the Ash station.—Apply to Mr. FINNEY, Guildford, Surrey.

CORN-DEALER'S BUSINESS.

TO BE SOLD, an old-established CORN-DEALER'S BUSINESS, in the most preferable part of the West End of London, having a large connection among the nobility and gentry, for which a Premium of 350*l.* will be required, and the Stock and Fixtures to be taken at a valuation.—For further particulars, address to A. B., Mr. Milligan's Office, Hungerford Wharf, Strand; or apply at MANSELL & ELLIOT'S Offices, 13A, Belgrave Square, and 12, Birchin Lane, Cornhill.

TO BE SOLD, a NURSERY and SEED BUSINESS, near the most fashionable watering place in the Isle of Wight. Coming in very reasonable, as the proprietor is relinquishing the business.—Direct to A. B., Mr. Whitmore, 7, High Street, Newport, Isle of Wight.

TO BE SOLD, pure black Norfolk and other varieties of TURKEYS, for Stock; also several kinds of the best Fancy and other POULTRY.—Apply to A. Z., care of Mr. Brill, Station Master, Needham Market, Suffolk.

MR. H. D. DAVIES has much pleasure in allowing any one to see his Stock of POULTRY; but some inconvenience having arisen from the visits of persons altogether unknown, and at unseasonable hours, those ladies and gentlemen who may wish to see the birds, are requested to favour Mr. Davies previously with their name and address, when a card of admission will be immediately forwarded. In future, no person can be admitted into the poultry yard without producing such a card, or at any other hours than those named for the purpose.
Spring Grove House, Hounslow.

BLACK COCHIN EGGS from the best birds in England, having always taken prizes at the best shows, at 18*s.* per dozen, including package. Apply at the city of London Wire Works, 44, Skinner Street, London. N.B. Fowl Houses, Chicken Coops, Poultry Hurdles, and Netting, of every size and description. Illustrated Catalogues forwarded, post free, on application. A few Spanish Pullets, sisters to those sent to her Majesty's yard at Windsor, for Sale.

SPANISH AND DORKING CHICKENS FOR 1854, bred from the Prize Birds at Bath, Cheltenham and Lincoln, and other first-rate Stock. As also some Brahma Pootra Chickens and White Aylesbury Ducks are now on Sale, and may be had by amateurs and others wishing to improve their stock of Poultry.—Apply, by letter only, post-paid, to Mr. H. D. DAVIES, Spring Grove House, Hounslow.

NURSERIES, CLAPHAM.

MESSRS. PROTHEROE & MORRIS are instructed by the Administrators of the late Jos. Fairbairn, to offer for unreserved sale, in the early part of September, the entire stock of specimen Greenhouse and Stove Plants, which are all of the most choice sorts, and in the best condition. The lease of the old established Seed Shop and Nursery to be sold; the Stock may be taken by valuation or by agreement: for particulars apply to the administrators, at the Nursery, Clapham, or to JAMES FAIRBAIRN.—ROBERT SILVESTER BROWN, and CLACK, Administrators, Nursery, Clapham.

CLAPHAM.
GREENHOUSE AND STOVE PLANTS.

MR. J. C. STEVENS has received instructions from Mr. Over, a well-known exhibitor at the Metropolitan Shows, to submit to Public Auction, on the premises, Albion Road, Larkhall Lane, Clapham, on WEDNESDAY, August 2d, and following day, at 12 o'clock, his collection of SPECIMEN STOVE AND GREENHOUSE PLANTS, consisting of Heaths, Azaleas, Allamandas, Ixoras, Dipladenias, Hoyas, Gardenias, a few Orchids, &c., all of which are in the finest possible health. May be viewed the day prior and mornings of Sale; and catalogues had (1*s.* each, returnable to purchasers) by applying to Mr. OVER as above, or to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

SUPERIOR DOWN COTSWOLD RAMS.

MESSRS. T. MALLAM AND SON have received instructions from Messrs Druce, of Eynsham, near Oxford, to Sell by Auction, on WEDNESDAY, the 9th day of August, at 11 o'clock, in a Close near Worcester College (being the Monthly Cattle Market at Oxford), about 30 SUPERIOR SHEARLINGS, a few older Sheep, and two well bred Yearling Bulls. The Auctioneers beg to observe that this Stock gained the first prize at Smithfield, in 1853, and has been successfully exhibited at the Birmingham and Midland Counties, and the Oxfordshire Shows, for some years past.

POPULAR WORKS ON BOTANY
BY DR. LINDLEY.

SCHOOL BOTANY; OR, THE RUDIMENTS OF BOTANICAL SCIENCE.
400 Illustrations. 8vo. Price 5s. 6d. half-bound.
BRADBURY & EVANS, 11, Bouverie Street.

Lately Published,

THE ELEMENTS OF BOTANY, STRUCTURAL AND PHYSIOLOGICAL. With a Glossary of Technical Terms, and numerous Illustrations. 12s. cloth.

This completes the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12s.

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5s.
BRADBURY & EVANS, 11, Bouverie Street.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14s.,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."
BRADBURY & EVANS, 11, Bouverie Street.

NEW TALE BY MR. CHARLES DICKENS.
On the 31st instant will be published, price 11d.,

PART 52 of "HOUSEHOLD WORDS," containing Five Weekly Portions of "HARD TIMES." By CHARLES DICKENS.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHEE, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

MILDEW AND RED SPIDER.

BAINBRIDGE'S ALKALINE EXTRACT.—We can confidently recommend the above as a sure remedy, having used it successfully for many years both on Vines and Peaches, &c. &c. Pints, 3s.; quarts, 5s. A quart is sufficient for 20 gallons of water applied with the Syringe.

BAINBRIDGE'S GUIDE TO THE CONSERVATORY, 5s. each. Sold wholesale and retail by R. BALDWIN, Paternoster Row. Gentlemen can procure the above in any part of the country through their Bookseller, in their Monthly parcels.

Sold also by BAINBRIDGE & HEWISON, 7, Bridge Street, York.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

On Monday, the 7th of August will be published, carefully revised and wholly reprinted, in One Volume, price 5s.,

HARD TIMES.

A GRAND EXHIBITION OF HOLLYHOCKS, Open to the United Kingdom, will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on TUESDAY, August 22. A Subscription is now open for the purpose of raising a fund of sufficient magnitude to distribute Prizes to Nurserymen and Amateur Growers worthy the merits of this noble and popular flower. It is intended to offer a Silver Cup, value 5*l.* 5*s.*, to each class for spikes in flower, with valuable descending Prizes of Gold and Silver Medals. Cut Blooms also will receive their due share of attention. In addition to the above, Gold and Silver Medals will be awarded for Miscellaneous Collections of Stove and Greenhouse Plants, Specimen Plants, Dahlias, Roses, &c.

COMMITTEE.—Messrs. W. Barnes, Peckham; J. W. Bircham, Bungay; W. Bragg, Slough; W. Chater, Saffron Walden; W. Paul, Cheshunt; A. Parsons, Ponder's End; Rake, Clewer; and C. Turner, Slough, by whom subscriptions will be received, also by the Secretary. Lists of Prizes, with Rules of the Exhibition, may be obtained of the Secretary, J. T. NEVILLE, Ebenezer House, Peckham.

SALISBURY GRAND ANNUAL DAHLIA EXHIBITION, open to all England, will take place at Milton Park, on Thursday, the 31st August, 1854, when Silver Cups and Plate will be awarded as under.

FIRST CLASS.—Amateurs, 24 blooms: Prizes, 7*l.* 7*s.*; 5*l.* 5*s.*; 3*l.* 3*s.*; 2*l.* 2*s.*; 1*l.* 1*s.*; 10*s.*

SECOND CLASS.—Amateurs, 12 Blooms: Prizes, 5*l.* 5*s.*; 3*l.* 3*s.*; 2*l.* 2*s.*; 1*l.* 1*s.*; 15*s.*; 10*s.*

THIRD CLASS.—Amateurs, 12 blooms, Fancy Flowers: 2*l.* 10*s.*; 1*l.* 10*s.*; 1*l.*; 10*s.*

FIFTH CLASS.—Seedlings, 1853, 3 blooms: Certificates.

SIXTH CLASS.—Seedlings, 1854, single bloom.

RULES AND REGULATIONS.—Flowers to be ready for the umpires as soon as possible after the first train from London. The flowers to be shown in the grower's own stands, which must be the same as the Metropolitan Society's. All entries to be made by the 28th of August. No entrance allowed after the 28th. Entrance for First, Second, and Third Class, 10*s.* each; Fourth, Fifth, and Sixth, 2*s.* 6*d.* No competitor to show unless he sends a letter containing a Post-office order, to the amount of his entries, to the Secretary, which letter shall be produced, if required. No growers that have sold green plants of Dahlias, whether Seedlings or otherwise, will be eligible to show in Classes One, Two, or Three. Prizes will only be given to two-thirds of the entries in all classes. All communications to be directed, post paid, to JOHN KEYNES, Salisbury, Honorary Secretary.

N.B.—No Prizes offered to Nurserymen.

STANDISH & NOBLE'S Catalogue for the present season is now ready, and may be had by inclosing two stamps for postage.—The Nursery, Bagshot, July, 1854.

ROBERT SIM'S NEW CATALOGUE of more than 250 species and varieties of STOVE, GREENHOUSE, and HARDY EXOTIC and BRITISH FERNS, &c., can be had for one stamp.—Nursery, Foot's Cray, Kent.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE begs to intimate that he has now ready for sale choice Seed of Calceolaria and Cineraria. The collection of Calceolarias from which the Seed now offered was saved forms an unrivalled one, and has been the admiration of all who have seen it; they possess every variety of colour peculiar to the genus, fine shapes, and have been awarded several first-class Certificates. Great care has also been taken in selecting the Cineraria from none but first-rate flowers; and, like the Calceolaria, it is warranted to give satisfaction.—Packets of both, 2*s.* 6*d.* each, will be sent on receipt of postage stamps to the amount.—Streatham Place Nursery, Brixton Hill, near London.

SPLENDID CALCEOLARIA, CINERARIA, & SWEET WILLIAM SEED.

WILLIAM BARNES respectfully begs to inform his friends and he public generally, that he has now ready to send out in packets, at 2*s.* 6*d.* each, seed of his unrivalled Herbaceous Calceolarias, which has given so much satisfaction for two years; the varieties have been selected with the greatest care, and none but the finest colours and best shaped flowers have been retained and carefully hybridised.

W. B. has for two years paid great attention to the improvement of the SHRUBBY BEDDING CALCEOLARIA, having purchased all the best kinds from the most eminent growers, and selected from them while in bloom the best shapes, finest colours, and most perfect shrubs; by careful hybridising he has succeeded in raising some first-rate varieties, and is now enabled to offer a few packets of fine new seed at 5*s.* per packet; this W. B. feels assured will give as much satisfaction as his herbaceous varieties have done before, which numerous letters he has received from various parts of the United Kingdom will testify.

CINERARIA SEED, saved from none but the very best and newest varieties in cultivation, at 2*s.* 6*d.* per packet.

The SWEET WILLIAMS have been grown in his Nursery Grounds for two successive years, and have caused universal admiration from all those who have seen them in bloom; nothing can be more beautiful for either clumps or borders, and they retain their great beauty for a very long time. Packets of fine seed at 1*s.* 6*d.* each. A remittance is expected from unknown correspondents.—Camden Nursery, Camberwell, London.

GRASS SEEDS.

SUTTON AND SONS *recommend the sowing of* GRASS SEEDS *during the month of August for permanent pasture, and are now prepared to supply excellent fresh Seeds for the purpose.*

Also New Italian Rye Grass and Trifolium incarnatum, at moderate prices.

JOHN SUTTON & SONS, Seed Growers, Reading.

SUTTON'S IMPERIAL CABBAGE, THE BEST FOR AUTUMN SOWING AND SPRING CUTTING. New Seed, 1*s.* per ounce, post free.

After trying nearly every sort in cultivation, we consider this decidedly the earliest and best Cabbage for the table. It is also a profitable sort for agriculture.

Address, JOHN SUTTON & SONS, Seed Growers, Reading.

JUST HARVESTED.

SUTTON'S EARLY SIX WEEKS, THE QUICKEST TURNIP KNOWN, *and the best for latest sowing.*

New Seed, 1*s.* 3*d.* per pound, or 7*s.* per gallon.

ANEMONE, from the most showy and brilliant kinds, 1*s.* "

30 packets of Choice Flower Seeds per post free for 5*s.*

The above, per post, free—Postage Stamps received in payment.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

CHOICE SEEDS.—Splendid mixed Sweet William, Antirrhinum, Primula sinensis fimbriata, Calceolaria, and Cineraria, Chater's Hollyhock, 1*s.* and 2*s.* 6*d.* per packet. Can be strongly recommended; saved only from the best flowers. Catalogues free by post.

DAWE, COTTRELL, & BENHAM (successors to F. Warner), Seedsmen, 36, Moorgate Street, and 3, Laurence Pountney Lane, City, London.

Agents for Butcher's Barbarossa Vines, M'Adam's Anti-Grape Blight Composition, and Cole's Concentrated Animal Manure.

GEORGE TAYLOR, JUNIOR, FRUIT SALESMAN, ST. JOHN'S MARKET, LIVERPOOL,

Contractor for and Purchaser of Choice Garden Produce.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, August 5.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out new seed of this year's saving, which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each; also a few packets of choice Cineraria Seed at 1*s.* 6*d.* and 2*s.* 6*d.* each. Primula sinensis, all saved from fringed flowers, 1*s.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.—Aug. 5.

MAY'S PARAGON CABBAGE.—Prepaid postage. The above superb CABBAGE can still be had in 1 oz. packets, 1*s.* each. Sow July and August.

Also new CINERARIA SEED from the best named flowers, in packets, 2*s.* 6*d.* each.

Address, HENRY MAY, the Hope Nurseries, near Bedale, Yorks.

STANDARD PORTUGAL LAURELS (in Pots); Cedrus Deodara, 3 to 8 feet; Araucaria imbricata, 2 to 5 feet; Rhododendrons, and a general collection of Trees and Shrubs; also Fruit Trees in Pots; Azaleas, Camellias, Roses, &c. &c., all in beautiful health, can be seen at H. LANE & SON'S, The Nursery, Great Berkhampstead, Herts, near to the Station on the London and North Western Railway. In the town there is an excellent Hotel, the King's Arms, with superior accommodation, combined with moderate charges, where a few days or even weeks could be spent for the purpose of roaming this delightful and beautiful neighbourhood.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy. RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, August 5.

WARD'S "OMER PACHA" STRAWBERRY.

W. J. WARD (by permission of his employer, W. Stephens, Esq.,) offers to his friends and the public the above Seedling Strawberry, which has been proved to possess superior excellence. It is a large handsome fruit, intermediate between the old Carolina Pine and British Queen, partaking of the fine colour of the former, and by many considered superior in flavour to the latter; it is also remarkable for the fine buttery quality of its flesh. Great bearer; ripe as early as Keens' Seedling, affording a long succession of fine fruit. It was exhibited at the Royal Botanic Gardens, Regent's Park, on Wednesday, the 5th of July, and obtained the Large Medal. It has also been submitted to Mr. Maclaek, Regent's Park, London; Mr. Thompson, Horticultural Society, Chiswick; and Mr. Spencer, Bowood, all of whom speak highly favourably of it. Also the following, who have pronounced it first-rate, and are open to take orders for it:—Messrs. Henderson, Pine-apple Place, London; Mr. C. Turner, Royal Nursery, Slough; Messrs. Standish and Noble, Bagshot; Mr. P. Lydiard, Fruiterer, Bath-easton, Bath; Mr. W. J. Epps, Bower Nursery, Maidstone; Messrs. Sutton, Reading; Mr. W. Barnes, Camberwell; Mr. Lewis Solomon, Fruiterer, Covent Garden.

Strong well rooted plants last week in August. Terms, cash or reference.—100 plants, 3*l.*; 50 plants, 1*l.* 15*s.*; 25 ditto, 1*l.* A few strong plants in 32-sized pots, 15*s.* per dozen.

Prospect Hill, Reading, August 5.

WILLIAM IVERY begs to inform his friends and the public that he is now prepared to send out his New GERANIUM FAVOURITE, the most beautiful variegated variety yet out. A great improvement on Attraction. Truss large, brilliant scarlet, free grower; splendid for bedding purposes. Price 7*s.* 6*d.*

GERANIUM MASTERPIECE (Ivery's). A beautiful scarlet of immense truss; foliage truly beautiful, the horse-shoe far surpassing Cerese; unique in variety of colours. Price 5*s.*

CINERARIA, MRS. TRUELOVE, figured in Turner's "Florist," May 1854; this variety has gained certificates at the National and other Societies: colour white ground tipped with rich plum, fine shape and splendid habit, 7*s.* 6*d.*

W. I. has now ready strong flowering plants of all the leading Liliputian and large flowering Chrysanthemums, from 9*s.* to 12*s.* per dozen. Autumn Catalogues can now be had on application, which contain a select list of Geraniums, Fuchsias, Cinerarias, Azaleas, Winter Blooming Carnations, Antirrhinums, Phloxes, Chrysanthemums, hardy Herbaceous Plants, Dwarf Roses in pots, Miscellaneous Plants, &c. N.B. The trade supplied with fine Mushroom Spawn.—Hanover Nursery, Peckham, London.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. Directions for application forwarded. Ten gallons and upwards carriage free to London.

For testimonials, see whole page of *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth.

From Andrew Toward, Esq., Royal Gardens, Osborne Palace.

"I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose Trees much affected with the Green Fly."

From Frederick Malleson, Esq., Royal Gardens, Claremont.

"I find it answer the purpose in all respects for Walls, also the Green Fly and Brown Scale in the Houses.—May 9, 1854."

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & CO.'s, Seed Merchants, Oxford Street, Southampton (20 yards from the Railway and Docks).

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Journal of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched in October. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, August 5.

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

EXHIBITED AT CHISWICK ON SATURDAY, JULY 8TH, BY MR. J. VEITCH, JUN., OF CHELSEA.

MESSRS. E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, beg to say that in consequence of some remarks having been made to them respecting the above, and other reports having been circulated, originating, as they have been given to understand, from the Exotic Nursery, Chelsea, and which they are sure can have no foundation, think it right to put the readers of this Journal in full possession of the facts — which are, that in the month of March of the present year, Mr. Veitch was in communication with Mr. Nuttal respecting the above Rhododendrons, and in a letter dated the 16th March, Mr. V. requested to have a single plant of the following varieties for inspection, which were accordingly forwarded to him, viz., Keysi, Nuttali, Kendricki, eximium, longifolium, lucidum, calophyllum, and Camelliæflorum; and no other plants have subsequently passed into his hands from Mr. Nuttal.

Messrs. E. G. H. & Son were quite aware of this circumstance at the time of purchasing, and that a few other plants had previously left the collection of Mr. Nuttal.

Wellington Nursery, St. John's Wood, August 5.

NEW FUCHSIAS OF 1854, sent out by Banks and others. The set of 17, well established plants, for 34*s.*, or any 12 for 28*s.*:—Stokes' Duke of Wellington, Smith's Telegraph, Kimberley's Henry Monteith and Globosa splendens; Banks' Autocrat, Charmer, Vanguard, Queen of Hanover, Elegans, Clio, and Magnifica; Cole's Trentham, Henderson's Monarch; Batten's Charles Palmer, Grandissima, and Admiral; Standish's Perfection.

NEW VERBENAS OF 1854, sent out by Banks, Keens, Smith, and others. A selection of any 30 from the following may be made for 40*s.*, or, per dozen, 18*s.*:—Keynes' Ajax, Arethusa, Captivation, Emily, Lord Mayor, and Magnet; Barnes' Lutea pallida, and Madonna; Smith's Peter Dick, Nobilissima, Climax, Eblouisante, Angelina, Queen, Alice, Scarlet King, Forget-me-Not, Zaria, Caliban, Giralda, Islington Rival, Magnificent, Laura superba, and Triumph; Robinson's Mrs. D. Tyssen; Edmunds' Rouge et Noir, and President; Banks' Orion, Robin Hood, Marie Antoinette, Matchless, Beauty, Madonna, Attraction, Diadem, Ne Plus Ultra, and Arioste; Fozart's Beauty of the Garden; Stewart's Sulphur Model, and Ida; Igley's Honeysuckle; Bragg's Standard, Fair Rosamond, Incomparable, Lord Seaton, King of Purples, Queen of Roses, Prince of Wales, Venus, and Queen of Purples; Mein's Lencostemma, Mitchell's Elegantissima.

NEW PETUNIAS OF 1854, the nine varieties for 14*s.*:—Kimberley's Novelty, Van Houtte's Striata formosissima; Barnes' Elizabeth, Distinctus, Pencillata, Rotunda, Alba magniflora, and Formosa; Smith's Montreal Purple.

A FEW NEW AND SELECT PLANTS.

Cassia floribunda, a very free flowering new variety, with handsome foliage	7*s.* 6*d.*
Clianthus magnificus, a very large and brilliant new variety, with glossy foliage	10 6

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.

—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

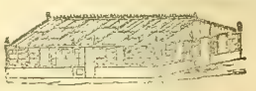
N.B. These prices do not include carriage, package, or expenses of delivery in the country.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

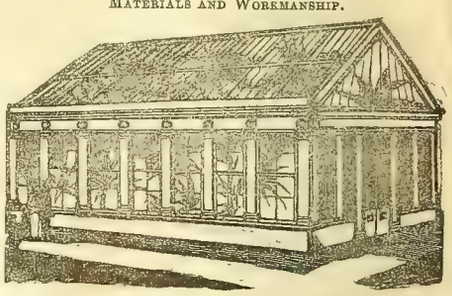
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

THE BEST PLANT OF THE SEASON.
"BEGONIA PRESTONIENSIS SUPERBA."

W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr. Frost, Gardener to E. L. Betts, Esq., Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with stamens and petals, resembling a double blossom with a golden tinge, exhibiting a charming contrast. The flowers are delightfully fragrant as a Tea-scented Rose. Habit—dwarf and bushy; the flowers are thrown well above the foliage, in large trusses, and altogether one of the best plants yet offered. It received the highest award in June, at the Royal Botanic Show, Regent's Park, as a new plant; also at Maidstone and Ashford. Plants in October, 10*s.* 6*d.* each; one given where three or more are taken.—Bower Nurseries, Maidstone, Aug. 5.

NEW AND DESIRABLE PLANTS.

YOUELL AND CO. beg to offer the following:—

FUCHSIAS, 15*s.* per dozen, viz.—Duke of Wellington, Monarch, Trentham, Queen of Hanover, Vanguard, Hendersoni, Premier, Princess, England's Glory, Model, Lady Franklin, Duchess of Lancaster, Mrs. Patterson, and other equally fine varieties.

CHRYSANTHEMUMS (large-flowering varieties) at 9*s.* per dozen, viz., Nell Gwynne, Rosa Mystica, Poudre d'Or, Rebecca, Madame Laborde, Norah, Rosée du Ciel, Berryer, Madame Dervaux de Lavarde, Mimosa, Osiris, Madame Andry, Ondine, Jenny Lind, Racine, Baron de Solyman, Atrorubens, Marshal Ney, Arc en Ciel, with many other fine kinds.

CHRYSANTHEMUMS (Pompon and Lilliputian varieties), at 9*s.* per dozen, viz., Drine Drine, Nelly, Cedo Nulli, La Vogue, Alveoflorum Caroline Gignoux, Sathaniel, Argentine, Princesse Mathilda, Atropos, Daphne, La Sapagon, Vitida, Lais, Mignonette, Madame Rousselon, Solfaterre, with many other fine varieties.

PHLOXES.—The following new and beautiful varieties, at 9*s.* per dozen: Striata Superba, Alexandrina, Mrs. Thompson, Maria Vincent, Madame Doublet, Aricie, Nimrod, Deuil de la Comtesse de Marnes, Bois Rose, Roi Leopold, Spenceri, Villaret, Joyeuse, Princesse Marianne, Napoleon, Madame Poivra, Madame Courcelles, Macrantha, Madame Lierval, Imbricata, Eliza, Anais, Diadem, and many other fine kinds.

GERANIUMS.—Crimson-flowering Ivy-leaved variety (sent out by Messrs. Standish & Noble), 2*s.* 6*d.* each.
" Boule de Neige (Horse-shoe leaf) with pure white flowers, 1*s.* 6*d.* each
" Kingsbury Pet, bright salmon, 1*s.* 6*d.*
" Miss Emily Field, blush white, 1*s.* 6*d.*
" Silver King, 3*s.* 6*d.*
" Mountain of Light, 1*s.* 6*d.*

TREE CARNATIONS, in 12 fine and distinct kinds, for Autumn and Winter blooming, 18*s.* per doz.

CHOICE GREENHOUSE PLANTS, &c.

" Lawrenceanum, 1*s.* 6*d.* do.		Sollya Drummondi ...	1 6
Dillwynia scabra, 2*s.* 6*d.* do.		Tacsonia mollissima, one of the handsomest greenhouse climbers	1 6
" sulphurea, 2*s.* 6*d.* do.			
Ericas, 50 choice kinds, fine bushy plants, 12*s.* per dozen.		Tetratheca ericifolia ...	2 6
		" verticillata	1 6
Epacris, 50 choice kinds, fine bushy plants, 12*s.* per dozen.		Weigela amabilis	2 0
Epiphyllum Snowi, 2*s.* 6*d.* each.			

GLOXINIAS.—The following new superb kinds, 18*s.* per dozen viz., La Perouse, La Bicta, Baron de Vriere, Imperialis, General Baudraud, Spectabilis, Mr. G. Adanson, Napoleon, Exquisite, Marginata, Amabilis, Victoria Regina, Wilsoni, &c.

Orders of 2*l.* and upwards are delivered Carriage Free to any Railway Station within 150 miles of the Nursery.
YOUELL & Co., Royal Nursery, Great Yarmouth.

The Gardeners' Chronicle.

SATURDAY, AUGUST 5, 1854.

Our correspondent, M. DE JONGHE, has raised a very important question; nothing less than the cause of the present UNPRODUCTIVENESS OF PEAR TREES. In a communication printed in our last number (p. 484), he maintains that the constantly recurring loss of our orchard fruit is owing, not as is alleged in England to spring frosts, but to our own mismanagement. As M. DE JONGHE possesses great experience in a climate pretty much like our own, and is in the best sense of the word a practical man, his opinions deserve the utmost respect. Let us see, then, to what points his criticism is directed.

His objections to our management fall under the following heads.

1. Our Pear trees are not grafted standard high.
2. Stocks are badly selected.
3. Scions are badly selected.
4. The trees are overloaded with spurs.
5. We prune ill.
6. We neglect cleanliness in our trees.

Half a dozen charges like these are sufficient to shake the nerves of the stoutest gardener, when put on his defence. Let us see what answer can be made to them.

Orchard Pear Trees should be grafted standard high.—M. DE JONGHE offers some explanation of this practical truth; but we are not inclined to acquiesce wholly in the reasoning. That the period of bearing is accelerated if a scion is put upon a stem 6 or 7 feet high, and three or four years old, instead of being compelled to form its own stem, must be admitted. A certain length of time is required to enable a tree to arrive at a bearing state; and if that time is passed in the nursery rather than in the orchard so many years' rent is saved. But then a nurseryman pays rent as well as a market gardener, and if he is to keep his trees three or four years longer than usual before he sells them, he must be remunerated by a higher price. No doubt a Pear-stock seven years old will bear quicker when grafted than a stock three years old, and so on. Of organisable matter ready to be formed into fruit there is much more present in an old stock than a young one. We should say that if immediate bearing is required then M. DE JONGHE is right, and in private gardens his views cannot but be accepted, when price is no object; but in market gardens it is questionable whether it is more profitable to pay rent for unprofitable land to the landlord or the nurseryman. One or the other must have it.

As to *a bad selection of stocks* our correspondent does not insist upon that; he merely suggests it. We believe that little or no objection can be taken to our English Pear stocks. Good, strong, hardy kinds, with a sound constitution, are certainly to be preferred, and M. DE JONGHE does not deny that they are so selected. In one respect grafting standard high secures the buyer from bad stocks; for weak unhealthy varieties will not form, soon enough for commercial purposes, strong healthy stems, such as Pear trees grafted 7 feet high must necessarily have.

That *scions are unskilfully selected* is no doubt quite true in many cases. An English gardener is satisfied with his scion if it is from nice clean young wood, and he does not enquire whether it is from a lateral or a stout upright shoot, from a tree grafted on a Pear or a Quince, from a good bearer or a bad one. But M. DE JONGHE's practice tells him that the scion should be carefully selected "from a vigorous shoot in the upper part of a bearing tree," and from no other place. He finds that such scions bear sooner and produce better heads. Upon this we have no remark to make; but we should like to know what the experienced orchardists of this country say to it. Since it is there that vitality is strongest, and that light and free air exercise their greatest influence, it is probable that his remark is just. But whatever opinion may be formed as to that point, no doubt can exist as to the impropriety of taking cuttings from trees weakened by old age, or bad stocks, or bad soils, or bad climate, or any other cause whatever. All experience shows that in every kind of created thing, be it man, or beast, or bird, the mysterious principle called life remains during the whole period of existence what it was at first. If vitality is feeble in the beginning so it remains. Weak parents produce weak children, and their children's children are weaker still, as imperial dynasties have sadly shown. When the rustic schoolboy translated the well-known Latin adage into "strong uns come from strong and good uns," he expressed in homely words a universal truth; and we have no doubt that M. DE JONGHE is perfectly right in applying the principle to the Pear tree. It was, indeed, the notoriousness of the fact that old decrepid trees produce sickly successors, themselves to become decrepid prematurely, which Mr. ANDREW KNIGHT misinterpreted into the limited duration of varieties, and which led his followers into wasting breath and paper upon endless applications of the misconception to the Potato disease. Undoubtedly the greatest care should be taken to ensure scions being procured from perfectly healthy trees with unimpaired vitality.

That our *trees are overloaded with spurs* is a very just remark. In fact, orchardists never dream of removing them. The more they have, the greater they fancy the chance of a good crop. They are like those speculators who, in their eagerness for immense gains, contrive to realise nothing. The Belgian, on the contrary, is the plodding, thrifty shopkeeper who takes care of his moderate profits, never makes much, never loses much, but in the long run finds a very satisfactory account at his banker's. It is an axiom in applied physiology that no animal or plant can bear more than its system can nourish; when an attempt is made to contravene this natural law, abortion is the result, or the produce, whether animal or vegetable, if it survives, is degenerate and imperfect. Let a Pear tree contain a pound of nutrition or natural food, ready to be attracted into its spurs; let each spur require a dram of such food, then the tree may carry 256 spurs, supposing the food to be equally distributed. But if a thousand such spurs are present it is probable, not that 750 will be starved and 250 fed, but that the whole will be starved; in the struggle among them for the food, none will obtain what is requisite to sustain life, and all will perish. M. DE JONGHE carries the application of the principle far beyond what is usual. He says that food and vitality may be practically regarded as identical, the one representing, or at all events accompanying, the other. If so, the action of frost becomet intelligible. Under favourable circumstances, thas is to say when well fed, the blossom of the Pear tree can support without injury, we will say, 10° of frost. In that case the thermometer falls to 22°, and no harm is done. But when ill fed, vitality is so low, and has such small power of resisting cold, that even less than 10° of frost are fatal; in such a state of health, if the thermometer only falls to 24°, every blossom perishes. That is our experienced correspondent's case. We have put it into a form which he, perhaps, may not have contemplated; but it represents exactly what we understand to be his opinion, and a very striking view of the action of frost it is. What is more, it is probably true, either wholly or in a great measure. We are assured that frosts which leave nothing behind them in England pass over the well-managed Belgian orchards without committing serious mischief. We have Mr. DE JONGHE's testimony to this fact in a former communication (see p. 286). He then stated that the great frost of April 24th, which ruined all the orchard crops in the south of England, had spared many of the Belgian hardier Pears, Cherries, Plums, and even Apricots. Our hardiest Pears, Cherries, Plums, and Apricots perished. Of course it is a question whether our hardiest fruits are as hardy as the Belgian. We entertain no doubt of their being so. This opens up a very interesting field of inquiry, which we cannot pursue to-day. On an early occasion we shall return to the subject, and then consider our correspondent's two remaining criticisms, viz., bad pruning and want of cleanliness.

DOES the reader know what a GOBBLE-GOSSIP is? The French call it a *gobemouche*, and regard it as a creature that lives upon flies; but we would rather say that its food consists of flies with the head off. Some say the animal belongs to the genus *Homo* of zoologists, though not to the species *sapiens*. Others are reported to have called it *Homo amens*. It abounds in fashionable places, especially where idlers congregate, and where it may be often seen attached to a button-hole. It is great among the low class of newspaper reporters, and is not unknown in London clubs. Its life is spent in spreading rumour, amplifying falsehood, modifying truth, inventing shams, scandal-mongering, and lying. Each has its train of believers, and although its news never proves right, yet there is so much credulity among its followers, that every new invention passes just as currently as if it bore the mint-mark of truth.

Lately one of these gobble-gossips has occupied itself with the affairs of the Horticultural Society. It is said that it has been seen with *épaulettes* on its coat, but that may be the invention of some other of its race. About two years since it informed its believers, with an air of mystery, that the Society did not intend to hold any further meetings at Chiswick; it was a sad thing, it said, that so great a society should be so ill supported, but the fact was as it represented; it had it from the best authority. In course of time, however, the usual meetings took place, in the usual way, and lie the first was then disposed of. Nothing daunted—gobble-gossips are never daunted; on the contrary, they are found to increase in confidence as their character for truth evaporates—our friend reported that with 1853 the garden would most certainly be closed, and that would of necessity put an end to the meetings; it believed, indeed, that Sir JOSEPH PAXTON had bought all the plants for the Crystal Palace Company, and it knew for a *fact* that the Society's lease had expired. But when the Crystal Palace opened nobody could find there the Horticultural Garden; again the meetings were held at Chiswick, with undiminished magnificence, and were even honoured by the presence of the QUEEN. One would have thought that this, at least, would have disconcerted the animal, and that the exposure of lie the second would have dulled its inventive faculties. Not at all. On the contrary, her MAJESTY'S visit confirmed all that it had reported. It had it from the highest source—it could not say more—that the real history of the Royal visit was a desire on the part of an exalted personage to take a last look at that which would never again be seen; that, in fact, the garden would be immediately converted to building purposes; and that the lease having fallen in, the Duke of DEVONSHIRE had caused plans of villas to be immediately prepared.

Since time must elapse before lie the third will perish by the ordinary course of events, we may as well dispose of that ourselves. We, therefore, contradict the statement in every particular. There is not and there never has been any intention of closing the garden of the Horticultural Society; the lease has not fallen in, on the contrary it cannot expire till the year 1881; and as for the tale of

converting the ground to building purposes, it only shows to what desperate expedients detected falsehood is sure to lead. The only building purpose to which the ground *can* be applied, under the covenants of the lease, is that of horticultural structures, and we know that the present autumn will not witness the erection of even another forcing pit.

The corporation of the Horticultural Society will hold its garden, maintain its exhibitions, continue its distribution of plants, and persevere in its course of usefulness, applying to the best of its judgment the funds at its disposal. Its collectors will still enrich our gardens with all that is most valuable in foreign countries, and it will remain what it has been for half a century, the centre of garden knowledge, without disturbing itself about malicious reports, or the idle inventions of the animals here described under the name of gobble-gossips.

VEGETABLE PATHOLOGY.—No. XXXI.

139. The next external agent to which we must advert is temperature, an element which enters into almost every question which concerns the animal or vegetable world. A certain degree of heat, varying according to the species, is absolutely necessary for the perfect performance of the functions of the several organs. A few species, such as Stellaria media, Poa annua, and Capsella bursa-pastoris, flourish and perfect their fruit at a temperature a little above freezing, while they are at the same time capable of enduring a considerable degree of heat, and consequently are found in most parts of the world, but more especially the latter; others, however, require much higher temperatures for the preservation of health; and certain functions, such as the irritability of various organs and tissues, are promoted by heat, and require a certain degree for their development. Impregnation takes place in many plants at a comparatively low temperature, while the maturation of the fruit requires a far greater degree of warmth. But few really tropical plants will bear exposure to the open air of our climate, even for a week, in the most favourable weather. In some cases evaporation takes place more rapidly than it can be supplied by the roots, in others the necessary chemical conditions are not present, or the vital energies of the cell walls are so lowered that the proper interchange of juices does not take place; and in great depression of temperature the juices freeze, decomposition takes place, and in some cases the cell walls themselves burst, or are separated from their mutual connection. In fact, apart from the special requirements of each individual species, within certain ranges only of temperature animal and vegetable life are capable of being sustained, and for the most part the ordinary scale of a thermometer exceeds these limits. A limited number of Phænogams, though frozen, will recover all their vital powers if the temperature is not too rapidly raised, inasmuch as sudden changes are destructive to life;* but a few degrees below the freezing point are sufficient to destroy the proper relation of the several component parts, and life in consequence ceases. Though the spores of cetain moulds are capable of sustaining a temperature equal to that of boiling water, without losing their powers of vegetation, and the yeast fungus has been known to vegetate after being exposed to a temperature 76° † below zero, no perfectly developed vegetable can survive such exposure, and in most cases life ceases far below that point. In all the degree of moisture makes a great difference in the power of endurance. The drier the medium the greater the power of resistance. This is not, however, without exception, for many plants utterly incapable of sustaining a high dry temperature luxuriate where the same degree of heat is attended with moisture.

140. In the hottest springs of Pugha in Tibet, at an altitude of 15,500 feet, and which attain a temperature of 174°, three species of Conferva, taking the word in its widest sense, were found by Dr. Thomson, together with several Diatomaceæ; at Momay, at an altitude of 16,000, where the water of the hot springs is 110°, about five Confervæ occur; and at Soorujkund, where the springs vary from 80° to 158°, between 84° and 112° there is a Zygnema, an Oscillatoria, and a Scytonema. An Anabaina occurs at 125° and upwards, and at 158° vegetation ceases altogether. Plants, however, have been observed by others to flourish at still higher temperatures. The lower Algæ, mixed with Lycopodium and Marchantia, flourished in the hot springs up to a temperature even of 186° Fahrenheit, as observed by Mr. Barrow at the Island of Amsterdam, and Chara has been found healthy and bearing fruit in a spring in Iceland so hot as to boil an egg in four minutes. Sir W. J. Hooker also found Riccia glauca in profusion, on spots which were so much heated by the boiling streams beneath that he could scarcely bear his hands upon the ground. As regards the temperature which Phænogams are able to sustain, there is some difficulty, as their roots may be seated beyond the influence of the high temperature, by reason of which the intrinsic temperature of the plants may be below that of the water in which they grow, exactly as is the case with plants exposed to a burning sun.

141. This depends upon the fact that the temperature of the earth may differ very greatly at different depths from that on its surface. It is well known that many succulent plants flourish under a nearly vertical sun; but then they part very slowly with their moisture: and, for a similar reason, some woolly-leaved plants, where the stomates are obstructed by the thick fleecy coat, are able to endure temperatures which nearly allied species, in which such a clothing is wanting, are quite unable to withstand. One of the best described cases on record of the difference of the superficial temperature from that in which the roots are plunged, is that mentioned by Dr. Hooker in his Himalayan Journals, vol. i., p. 36. The fresh milky juice of Calotropis was only 72° when the surface sand was heated to 110° where sheltered from the wind, and 104° in the open bed of the river. At the latter temperature it was necessary for the roots to descend 15 inches to imbibe moisture at the temperature of the juices of the plant. The exposed leaves meanwhile maintained a temperature of 80°, nearly 25° cooler than the similarly exposed sand and alluvium. On the same night the leaves were cooled down to 54°, when the sand had cooled to 51°. Before daylight the sand had cooled to 43°, and the leaves of the Calotropis to 45½°; but the sand at the same depth (15 inches) as that at which its temperature and that of the plant agreed at midday was 68°. And assuming this to be the heat of the plant, we find that the leaves are heated by solar radiation during the day 8°, and cooled by nocturnal radiation 22½°. Part, therefore, alone of the effect is to be attributed to the temperature of the soil, for this is modified by radiation. It is not, however, meant that the superficial heat of the soil, especially when sandy, is not frequently far above this. The temperature in tropical climates reaches frequently as much as 126°, and Humboldt has recorded its attaining on one occasion 140°. *M. J. B.*

* Exposure to light is injurious to plants under such circumstances, because it stimulates the vital powers at a moment when they are collapsed, and it is requisite to resuscitate them very gently.

† This statement is made on the authority of Dr. Carpenter, Man. of Phys. p. 65. Bottom yeast is not formed at a lower temperature than 32° F. But the question is not as to the germination of the Yeast Fungus, but as to the degree of cold which it will bear without losing its powers of germination.

WOODS AND PLANTATIONS.—No. II.

The pressure of other engagements has caused me to delay the few additional remarks which I have to offer upon this interesting theme. For this delay I crave the pardon and indulgence of those who were kind enough to say that they were looking forward with interest to my future observations; and believing myself far from infallible, I would, for my own benefit as well as that of your general readers, invoke the criticism of those persons who are conversant with this particular department of rural economy.

Woodland property, independently of scattered park trees and hedgerows, is generally made up of large tracts comprising timber and underwood—called in rural parlance, woods—and of plantations, in which all kinds of trees are planted, without reference to undergrowth, or indeed to any methodical arrangement. I will first consider the management of woods.

The mixture of timber trees and undergrowth, so called, is the most ancient form in which we find this species of property, and the one which departs least from the status of our aboriginal forests; where, under the gigantic arms of widely spreading Oaks, we find attenuated Thorns, consumptive Crabs, and sickly Briars forming the most picturesque combinations which the eye of taste could desire to see; here presenting bold projecting masses, and there intricate and ever varied recesses.

To those who appreciate the expression of sylvan scenes, nothing can be more beautiful than the margin of a natural forest; there can be no better place to study the art of grouping, and well would it be if some of our modern landscape artists were more frequently to make such scenes their models. We should then be spared the infliction of those linear and monotonous belts and kidney-shaped clumps which are so often perpetrated, and which are not only abortive in an artistic sense, but too generally destroy breadth.

Apart from the consideration of effect is that of utility or profit. I have always been of opinion that it is possible to do what is not done generally, viz., combine beauty and profit, by adopting the lesson which the margins of our natural forests teach us as to effect; leaving groups of trees and thorns and cutting recesses into the borders of them with the care and taste of an artist, rather than under the guidance of inexorable law of equi-distant thinning, which is perfectly monotonous. I would leave a broad margin to every wood to be thus treated in the picturesque manner, and afford shelter to the interior; but within this I would adopt the most perfect system of preventive pruning, exposure to light, and equalisation of space. I would even be so heretical as to separate the underwood from the timber, growing it separately, an idea for which I am indebted to my friend Mr. Spencer, of Bowood, and which is worthy of attention, when we consider the small acreable profit which is derived where the trees are left their usual thickness. Of the advantages which would follow such a plan, the difference of poles cut from an Ash spinney and those mixed with a general growth of underwood offers a familiar example. All good gardeners and farmers admit the important agencies of light and air in promoting the growth of their crops; they know that it does not answer to grow one crop under the shade of another; why then should we expect our underwood to thrive and remunerate us, if we deny it one of the first principles of life, cultivating it under the shade and drip of trees, and in situations "nulli penetrabilis astro?"

Evelyn says, "there is no more noble or worthy husbandry than is this." He says, too, "Copses are sometimes of competent stature, about eight or ten years." This octennial cutting is still practised in the midland counties, and demonstrates how little alteration has taken place in the management of woods for the last 200 years, while it is quite clear that the whole plan was indicated by the state of our primeval forests, where a continued struggle for existence resulted in the annihilation of the weaker for the benefit of the strong.

In ancient times, the supply of underwood and timber, owing to the great extent of forests, might not be worth a consideration, but even then we find "our more prudent ancestors," enacting laws for the perpetuation of a supply of Oak timber. "By the statute 35 Henry VIII., in copses or underwoods felled at 25 years' growth, there were to be left 12 standils or stores of Oak upon each acre. In default of so many Oaks, the same number of Elm, Ash, Asp, or Birch, and they to be of such as are of likely size for timber, and of such as have been spared at some former felling, unless there were none, in which case they are to be then left, and so to continue without felling till they are 10 inches square within a yard of the ground."

I make this quotation to show that our ancestors, with their vast resources, thought it worth while to legislate with regard to the prospective supply of timber. Those vast forests which supplied them are no more in existence. In the great march of civilisation, and its attendant arts and manufactures, our wooded plains and hills are denuded of trees, which are rapidly succeeded by vast piles of bricks and mortar, teeming with life. Surely, then, it is time that attention should be paid to these things; every day the demand increases, and as daily the supply lessens. Too many young trees are invariably left to struggle with each other when woods are cut, and the underwood is much of it destroyed. I advise most strongly the explosion of this antiquated practice. We require to increase our produce from smaller means, which can only be accomplished by fostering knowledge and discarding prejudice. *Henry Bailey, Nuneham.*

HOYA BELLA.

To have this charming little Hoya in perfection, it requires plenty of warmth and moisture while growing, good drainage, and a free open soil. The latter should consist of equal parts good fibrous peat, leaf-soil, and sand, well mixed together, to which may be added a tolerable portion of clean potsherds, broken small, and a few pieces of charcoal. The pots used should be drained from 1 to 2 inches in depth, according to their size. The peat should be broken up with the hand, but not sifted.

Presuming that young plants are obtained in spring, they should be placed in a stove or pit, where a temperature of from 65° to 70° is kept up. Under such circumstances they will grow freely, and will soon require shifting into larger pots. Shade slightly during bright sunshine, and water when necessary; but with a sufficiently moist atmosphere, and a moderate use of the syringe on favourable occasions, but little will be required at the roots, heavy drenches of water being prejudicial to them. As they progress, the leading shoots should be stopped, in order to induce the formation of more numerous branches, which should be spread out and arranged so as to make a neat specimen. If by the middle or end of June the plants are still growing freely, another shift may be given and the same temperature maintained. When they begin to cease growing, which they should be encouraged to do early in autumn, they should be placed on a shelf near the glass to ripen their wood, and a drier atmosphere should be maintained; they may be kept here during winter, provided the temperature is not higher than 55° or 60°; during that season just sufficient water will be required to preserve the foliage in health.

Early in January, or a little later, as may be convenient, the plants should be cleaned, top-dressed, and placed in a growing temperature as before directed, keeping the atmosphere moist, to induce them to break freely. When they have broken well, if large plants are desired, they may be shifted and grown on; but, if intended for flowering, it is preferable to defer shifting, as they bloom most freely when slightly pot-bound. The flower buds will make their appearance as the young shoots progress; and, when commencing to expand, a drier atmosphere, and a somewhat cooler temperature will prolong the duration of the flowers. If well attended to during the summer, the wood will be perfectly ripened by the time the flowering is over, and the plants may be wintered as before. If it is necessary to prune them back it should be done a few weeks before starting them, in order to allow time for the wounds to heal over before growth has commenced.

This plant has a fine effect, either planted out or plunged in a basket of moss, and suspended from the roof of a stove or Orchid house. In this way the flowers show themselves to advantage; and if the plants are kept moist while growing, and otherwise well treated, they will last for several years in perfection.

Cuttings made of the young shoots root freely; insert them in sand, cover with a bell glass, and place them in a temperature of 70°, where there is a gentle bottom heat. When rooted pot them off singly into two or three inch pots, and place them in a close warm situation; if rooted early they will make strong plants by autumn. *Alpha.*

AËRATION AND VENTILATION.

THERE are many who will scarcely give themselves the trouble to inquire in what respect aëration differs from ventilation, and in consequence of not doing so regard the two as synonymous. Indeed I may almost say this is generally the case, although on a little reflection it must be evident they are not identical, as was shown when they were formerly noticed in the *Gardeners' Chronicle*. In the volume for 1845, p. 267, aëration is defined as "the art of keeping the atmosphere of a forcing house in motion by currents of warmed fresh air," whilst ventilation is stated to mean "the process of letting the external air at once into the forcing house." This is no fine-drawn distinction, but a very important difference which every cultivator ought to bear in mind, especially when it is considered that it is mainly owing to the power they possess of regulating the atmosphere of their forcing houses in a proper manner, and at the time required, that their success is to be attributed. The reason why aëration is advantageous, has been so clearly pointed out and explained in the article to which I have just referred, that I trust I shall be excused for bringing it again under the notice of those who are likely to profit by its study and perusal. It is there stated that—"A man's reason must tell him that a plant condemned to pass its life in a still atmosphere is like nothing so much as a criminal set fast in an everlasting pillory. In order to secure motion in the vegetable kingdom, currents of air are made to do the work of the muscles, limbs, and volition of animals. It is not at all improbable that, in addition to the mechanical effect of motion in assisting the propulsion of the sap, it may be important that the stratum of air in contact with the leaves of plants should be incessantly shifted, in order to enable them to procure an adequate supply of food; for we find that water in motion feeds them better than that which is stagnant. Leaves are continually abstracting from the air the very minute quantities of carbonic acid which it contains. When the air moves quickly over the surface, fresh supplies of that food are incessantly presented to it, and the operation of abstraction may be facilitated; while, on the contrary, if the air is stagnant, the absorption of carbonic acid may be much slower. In an absolutely still air perspiration will be reduced to its minimum, and it will increase within certain limits, in proportion to the quickness with which the air sweeps over it. The motion of the air being thus favourable to the two great operations of feeding and perspiring, we shall find it is equally needed day and night, for perspiration goes on principally during daylight, and feeding in the hours of darkness. A good system of aëration must then be constantly in action." (*Gardeners' Chronicle*, volume 1845, page 267.)

With the view of effecting this, a variety of plans have been devised from time to time, which, to a certain extent, have answered the purpose; but I think it will be admitted that a great deal yet remains to be done before it can be said that a proper system of aëration has been perfected. At present it is a desideratum, and the oftener the subject is discussed the more likely are we to discover the path that shall lead us to the object which has so long evaded our pursuit.

Some years ago a correspondent suggested that a small machine, made on the principle of a winnowing-fan, might be employed for the purpose of ventilating hothouses. The farmer, it was said, obtained a very powerful current of air in a small compass by such means; and the gardener, it was thought, might obtain the same advantages by adopting a somewhat similar plan for his forcing-houses. The machine might be so constructed as to be wound up like a clock, when its gradual action would produce a gentle and continuous breeze; and, by turning a winch or handle, the degree of wind might be increased to any extent desired. Such an apparatus, I find, was lately made the subject of a patent. It is known as Haig's pneumatic engine, and is stated to be admirably adapted for the complete ventilation of houses, churches, and public buildings of every description; the lower decks and holds of ships, and the engine-rooms and stoke-holes of steam-vessels. It is now in use on board of her Majesty's ships Asia, Prince Regent, Duke of Wellington, and several others; and has been fitted up by order of the emigration commisioners on board the Calabar, bound to Port Philip. Some idea of its power may be formed from the fact that in a trial that was made of it at Messrs. Hoare and Co.'s Brewery, East Smithfield, one of their largest vats (which holds about 1200 barrels) was emptied from carbonic acid gas in the space of 50 minutes, so that a man went to the bottom of it in perfect safety.

Now it appears to me that a small machine which can exhaust the air in the manner just described, might, by a little ingenuity, be so contrived as to produce a circulation of air in our hothouses at a time when it would be unsafe to ventilate, and I think it not unlikely that after we have become more alive to the advantages which vegetation derives from a circulation of heated fresh air, some such machine as the one I have noticed will be looked upon as a necessary appendage to our pits and early forcing-houses. At present Haig's invention may be considered a move in the right direction, and as it is capable of being easily fitted to hothouses or pits at a trifling expense, I trust the preceding remarks may induce some of our leading horticulturists to give it a fair trial, and favour us with the results. *W. B. B.*

Home Correspondence.

Watering Plants.—Although during summer plants in pots require plenty of water, yet the too frequent application of it to hard-wooded things, such as Azaleas, Ericas, Epacrises, &c., even in the growing season, has the injurious effect of retarding the ripening of the young wood until the season is so far advanced that the securing this desirable object becomes a matter of impossibility. Plants like those just mentioned, when started into growth, provided they are not over-potted and the balls are well drained, require, both in the quantity given and the frequency of its application, a gradual increase of this element, the administration of which ought to be regulated by the state of the weather on the one hand, and the condition of the roots on the other. In dull weather, for instance, and especially if accompanied by a humid atmosphere, an interval of from 24 to 48 hours might with advantage be allowed to elapse between the waterings; for, at all seasons, the fine thready fibres which constitute the roots of these plants are very impatient of excessive moisture. Again, to avoid the danger in this respect resulting from overpotting the plants, care should be taken to have the size of the pots proportionate with the strength of the plants, so that by the time the latter have done growing the pots will have become filled with roots. Treated in this way, both the wood and the roots will grow and ripen together, a condition which will enable the plant to resist the ill effects of an occasional overwatering. After the growing season is over, the plants of Indian Azaleas should be removed to the plant ground, for the twofold purpose of hardening them off and preventing them from making a second growth; and in order to protect them from the effects of rough weather, it will be advisable to provide each row with a few short stakes driven firmly into the ground, to which should be securely fastened a single fence of neat rods, to suit the height of the plants. To this support, one tie for each plant will be ample. Ericas and Epacrises, however, should on no account be consigned to the plant ground, for a continuance of wet weather is certain death to them. A cool pit having a south aspect is the best place to grow them in; and if they have a cool well-drained bottom to stand on, all the sun it is possible for them to have will not harm them. They must, however, have plenty of air; and with proper care in watering, no fears need be apprehended for their perfect culture. *R. Miles.*

Woods and Forests.—Will you be so good as to inform me whether Mr. Lipscombe, the Surveyor of Delamere Forest, is still in charge? or does Mr. Kennedy's very proper dismissal of him stand good? And is Sir James Campbell also removed from Bere? I ask because I see from the report of Mr. Drummond's committee that both Mr. Lipscombe and Sir James Campbell received a guinea a day, in addition to their expenses, which I suppose would not be the case if in the service of the crown. *W. G.* [We know no more than the committee says. It is, however, quite consistent with the other part of the Royal forest management that officers should be paid twice over for the same duty; once for doing duty in London, and once for doing duty at the same time in their forests. You should observe, however, that neither Mr. Machen nor Mr. Higginbotham received more than their travelling expenses, and Mr. Cumberbatch received *nothing*.]

Nicholson's New Strawberries.—I recently inspected Mr. Nicholson's Strawberries at Egglescliffe, and made the following notes regarding their respective merits:—Ajax is a very distinct variety; there is no Strawberry I have seen which bears the least resemblance to it. It is a very strong grower and a good bearer; the colour of the fruit is a deep shining red, the seed is very thinly set and deeply imbedded in the berry, which is large in size, of a fine globular shape, and remarkably juicy and sweet. As a dessert Strawberry I consider it unequalled. Ruby is a vigorous grower; the shape and colour of the fruit very much resembles that of "Ingram's Prince of Wales," but it is not so highly flavoured as that variety; it is an immense bearer, and ripens its fruit for a long time in succession; this must prove one of the most useful Strawberries in cultivation. Fillbasket is another sort that is well named, the ground round it being literally covered with fruit. In colour it resembles the "British Queen," size large, and it is passable in flavour; for market gardeners this variety will be invaluable. Captain Cook is also a great bearer; the fruit is larger and deeper in colour than that of the preceding sort, and I thought better flavoured. I also saw one or two more very promising seedlings, one of which was remarkable for its bearing properties; on one plant alone I counted no fewer than 200 perfectly formed fruit in various stages of ripeness. Altogether I have never seen such crops of Strawberries as I saw at Egglescliffe. *J. W. Kinmont, Castle Gardens, Bishop Auckland.*

Wire.—The wire of cages in which squirrels, mice, and such creatures, perform their revolutions, is liable to be destroyed by their wetting it. Would the wire galvanically covered over with tin, or [any other preparation of wire, resist the influence of that acid? *A. H.* [Yes.]

New Habitat for Ladies' Traces.—An excursion was recently made to Wyre Forest, in this county, by a few members of the Worcester Branch of the Phytological Club. They were accompanied by Mr. Jorden, of Bewdley, a gentleman who has done more to develop the treasures of the neighbourhood than any botanist of the district; and who still, though over 70 years old, maintains all the vigour and enthusiasm of youth. In the heart of the forest, on the margin of a bog, white with Eriophorum latifolium, Mr. Jorden was fortunate enough to discover a specimen of Spiranthes æstivalis. We looked vainly for more; but the plant found being only in bud, I hope more plants may spring up. *T. W. Gissing*, 44, *High Street, Worcester, August* 1.

The Potato Crops around Bath were in flower early in July, and were so unexceptionably healthy that I concluded the crop was safe. About the 21st or 22d ult., however, the foliage was struck, and last week entire plots were diseased and stinking. They were the Champions, and it was remarkable that in the same gardens other sorts were yet in a perfectly healthy state. Does this arise from some varieties being able to resist the disease longer than others? If not, the cause cannot be from any condition of the atmosphere. From the beginning, however, the impression on my mind has been that the disease arises from want of electricity. *C.*

Yucca gloriosa.—Amongst a choice collection of trees and shrubs, including many fine specimens of Conifers and rare plants, in the grounds of the Marquis of Huntley here, may be seen a Yucca gloriosa in full blossom. It has two flower stalks measuring 9 feet in height, and 2300 perfect blooms on it. *Angus Ross, Orton Longueville, Peterborough, August* 2.

Vine Pruning.—Your correspondent "Quercus" doubts whether the general practice of pruning Vines on the spur system is at all times in accordance with the laws which promote a corresponding reciprocity betwixt the roots and the leaves, although he has no cause to complain, having adopted that mode of pruning with success. The following are the results of my experience in the matter. When I came here in February, 1848, the Vines in one of the vineyards were a mass of young wood, they had not then been pruned for the season. My predecessor stated that allowing so much wood to remain was the only means he had of insuring a crop of fruit. I, however, proceeded at once to reduce the number of shoots to one or two rods to a Vine. The result was a middling sprinkling of Grapes; not being satisfied, the next year I left one rod to each Vine (there being a Vine planted to each rafter); I then spurred them to two eyes, but I got only a few Grapes, and the most of them stunted, but the efforts on the part of the Vines to produce wood and foliage were most satisfactory, emitting, as they did, abundance of roots, if I may so term them, along the branch. The following season I pruned them to spurs a foot in length, with the view of checking the vigorous growth, and to cause them to produce fruit—but it was a failure. I then trained some shoots for rods; the next season these produced a favourable crop, while the spurs remained barren as before; however, I continued to train shoots for rods, entirely abolishing the spur system of pruning; this year my labours are agreeably rewarded with what is considered a plentiful crop—some have borne two bunches to a shoot; from this I am led to infer that in the formation of the border the soil was too rich and light, causing a rampant growth, thus creating tap roots instead of an increased quantity of spongioles, which are so essential for absorbing the nourishment necessary for the production of fruit. The Vines, in my opinion, had been planted too thickly; instead of one Vine to a rafter, if there had been one to every three it would have been able to extend its growth, and to somewhat keep pace with the extension of the roots, as I would say that the top growth was not reciprocal with the under growth, especially when the spur system of pruning was adopted. *John F. M'Elroy, Gardener to W. J. Lancaster, Esq., Stamford Hill.*

Shallots.—I planted a pint of Shallots in the second week in March, each measuring 3 inches in circumference, and they have yielded me a bushel of fine bulbs, many of them 8 inches in circumference. Is not this a large increase? [Yes.] *John Brackling, Gardener to the Rev. J. Ekins, Sampford, Braintree.*

Effects of the Winter at Bicton, Devonshire.—In addition to Conifers (see p. 437), the following have been more or less injured. Clematis Gebleri, and a species from New Holland, have been killed entirely; but C. florida, C. flore pleno, C. Sieboldi, C. cærulea, and upwards of 20 other species and varieties remain uninjured. Tasmannia aromatica, Illicium anisatum, floridanum, and religiosum, are all uninjured. Magnolia exoniensis, glauca, cordata, Soulangeana, Alexandrina, and macrophylla, and 30 other kinds, have not exhibited the least effects of severe weather; a large plant of M. fuscata against a wall has stood well, and has had hundreds of flowers open daily; Schizandra coccinea, Kadsura japonica, and Menispermum canadense, have all stood well unprotected. All the Berberries are uninjured, and have bloomed beautifully; more especially B. dulcis, buxifolia, canadensis, cretica, rotundifolia, petiolaris, and Darwini, which last is one of the handsomest; B. nervosa, Fortuni, fascicularis, hybrida, trifoliata, and all the varieties of aquifolium, have also bloomed most profusely. Cistus incanus, salvifolius, and tauricus have been killed; but some of the other kinds have been beautiful objects for a long time—such as C. heterophyllus, monspeliensis, candicans, cymosus, laxus, ladaniferus, and corbariensis. The Helianthemums are hardy and striking objects; more especially on a fine day, when their variety of colours and profusion of bloom have a fine effect. Pittosporum Tobira, variegatum, and eriocarpum, have been killed down to the ground. Thea viridis, bohea, and oleifera, slightly protected, have remained uninjured; one large plant of Thea viridis, 8 feet high and as much through, has stood uninjured for years, and is at this time of a fine dark green colour. Hypericum uralense and nepalense have been killed, and

Coriaria nepalensis, protected, has been killed to the ground; Euonymus japonica and argentea have lost their leading shoots; Celastrus buxifolius has been killed down; Ilex excelsa had all the young wood killed, but other tender sorts have not been injured, such as cassine, vomitoria, Maderensis, and balearica; Zizyphus vulgaris has been killed; Rhamnus sempervirens, hybridus, and oleoides, and the more hardy kinds, have remained uninjured; Colletia horrida has had a very gay appearance, having been covered with little bell-shaped flowers; C. Bictonensis is a singular but ornamental shrub, with thick succulent wood, covered with sharp spines, very minute leaves, and little white bell-shaped flowers. Ceanothus dentatus has been killed, but C. thyrsiflorus, divaricatus, rigidus, azureus, intermedius, papillosus, and americanus have remained uninjured; Pistacia vera and lentiscus have had their foliage and young wood very much cut; Duvaua latifolia has been killed, but dependens, ovata, and longifolia are uninjured, as are also Virgilia lutea; Edwardsia macrophylla, and microphylla, and all the Genistas are unhurt, such as triquetra, lusitanica, radiata, tinctoria, Scorpius, tinctoria plena, and procumbens; Cytisus hirsutus, elongatus, capitatus, sessilifolius, polytrichus, and purpureus, are unharmed. Adenocarpus intermedius has stood unprotected, and is now a grand ornamental shrub, being 8 feet in height, and covered with beautiful racemes of flowers. Acacia Browni has proved to be one of the hardiest of shrubs, it is of a dark green colour, has a beautiful pendulous habit, and when covered with flowers it has a grand appearance; Caragana pygmæa, jubata, Gerardiana, ferox, and spinosa, are uninjured; as are also Coronilla glauca, Emerus, media, arborea, and Astragalus tragacantha; these have had no protection. Spiræa trilobata, alpina, decumbens, sinensis, canadensis, tomentosa, lævigata, lanceolata, nepalensis, and Reevesiana, are all uninjured, although they have had no protection; Photinia serrulata and glauca are likewise uninjured; Elæocarpus cyaneus has been killed; Deutzia scabra, corymbosa, staminea, and gracilis are uninjured, and have flowered in the greatest profusion; Myrtus communis and mucronatus, unprotected, have remained unhurt; Eucalyptus montana has not been injured, but oppositifolia and pulverulenta, although protected, have been killed; Passiflora Colvilli, racemosa, and rubra, have been cut down; Escallonia caracasana has been killed, but viscosa, macrantha, alba, and illinita have escaped without injury, also all the other varieties; Hydrangea altissima, hortensis, involucrata, azasia, and quercifolia are uninjured; Aralia trifoliata and quinquefolia, although protected, have lost all their leaves; Benthamia fragifera has stood without injury. Viburnum odoratum has been cut down; V. chinense had all its foliage killed; Weigela rosea, exposed to the full severity of the weather, has not been the least affected by it, it has been one mass of flower and very gay; Abelia rupestris has escaped without injury; Ozothamnus rosmarinifolius has not suffered in the least, and is now one mass of white flowers. Most of the Heaths have a gay appearance, such as stricta, ciliaris, Mackayana, carnescens, and atropurpurea. Erica arborea is one of the most useful shrubs here, being in flower all the winter months, and the blossoms are not injured by frost; Leucothoe axillaris, latifolia, Catesbæi, spinulosa, acuminata, and floribunda have all been very gay; Arbutus myrtifolia and farinosa, although protected, have been killed; and Arctostaphylos nitida and arbutoides have been killed; Pernettya pilosa, floribunda, Cunninghami and mucronata have escaped without injury; Gaultheria coccinea has been killed; Rhododendron rubellans, Farreri, norbitense, and fimbriatum have been killed; all the other kinds have flowered abundantly, the following being most striking: cinnamomeum, rubricaule, Dickensi, Hibberti, catawbiense, altaclerense, venustum, Nobleanum, pulcherrimum, coccineum superbum, speciosum, campanulatum, elegans, splendens, tigrinum, hyacinthiflorum, præcox, and Charles Truffet; also splendid large plants of the arboreum have flowered truly grand. Styrax officinale and lævigatum have had all their young wood killed; Myrsine bifaria has been killed; Olea europæa and robusta have escaped without injury, but fragrans has lost all its foliage, and O. grata has been entirely killed. Forsythia viridissima is uninjured; Jasminum odoratissimum has been killed, but officinale, Walkeri, Reevesi, and nudiflorum have not been injured. Physianthus albus has been killed; Bignonia capreolata has had all its leading shoots destroyed; Solanum crispum and jasminoides have escaped without injury; Fabiana imbricata has not suffered in the least; Buddlea Lindleyana has been killed down; Paulownia imperialis has lost all its leading branches; Veronica speciosa has been killed; Pentstemon scaber is unhurt; Deeringia Amhersti has been killed; Polygonum vaccinifolium and Grevillea rosmarinifolia have escaped without injury; Laurus variegata and carolinensis have had all their young wood killed, but Sassafras, Benzoin, and angustifolia are uninjured; Tetranthera japonica is unhurt, although not protected in the least. Daphne japonica, Tarton-raira, neapolitana, collina, variegata, Aucklandi, and oleoides have all been killed, although they had the protection of a box and dry Fern; Elæagnus reflexa has escaped without injury; Aristolochia tomentosa, Broussonetia papyrifera, Maclura aurantiaca and Ficus carica are all unhurt; Quercus lanata, hybrida, nana, rugosa, virens, heterophylla, and americana alba grandiflora, although protected, have all been killed. Quercus sclerophylla, Catesbæi, and polymorpha have been killed down; Q. glabra has escaped without injury, and is one of the most striking species we have, the foliage having more the appearance of a Magnolia than an Oak; it is 8 feet high by 8 feet wide. Q. mexicana, confertifolia, sempervirens, grandifolia, Louetti, Meerbecki, appenensis, dealbata, pannonica, tauzin, coccifera, nigra, laurifolia, coccinea, sinuosa, and Ægilops are all uninjured; they are in a very flourishing condition, and will soon make some fine ornamental trees. Fagus antarctica is another very interesting tree, perfectly hardy, and making rapid growth; F. Cunninghami is more tender and also more slender in growth, having more the appearance of a Birch (Betula nana); Garrya elliptica, and macrophylla have not suffered in the least; Comptonia asplenifolia has escaped without injury. *James Barnes.* [It is much to be regretted that in this valuable report the names of so many plants should occur of which nothing is known, and which are beyond doubt *aliases*, or trifling varieties of species otherwise named in science.]

Potato Disease.—The Potato disease this year is very general, and from the appearance of the plant in this neighbourhood, I was surprised that any district should be so exempt, as represented by Messrs. Hardy and Sons, for here it seems to have assumed its worst character, and, singular to relate, the early kinds seem most affected. I have now growing luxuriantly a late red kind without the slightest taint or trace of infection, whilst not a hundred yards from it are Rogers's Prolific, Ashleaf Kidney, and Early Oxfords, in a most deplorable condition, quite half of the tubers being unsound; nor is this state of things confined to gardens, for the farmer's crops present a most melancholy aspect; the luxuriant appearance of the fields a few weeks since is now destroyed by the scorched and shrivelled foliage of the plant, and the atmosphere in their neighbourhood is heavily impregnated with the well known odious effluvia. *J. B., Derry Ormond Park, near Lampeter, Cardiganshire.*

Hornbeam.—Addison, in the "Spectator," No. 477, recommends a winter garden to be planted with Evergreens. "The walls are covered with Ivy instead of Vines. The Laurel, the Hornbeam, and the Holly, with many other trees and plants of the same nature, grow so thick in it, that you cannot imagine a more lively scene." Being unacquainted with any evergreen species of the Carpinus, or what we commonly call Hornbeam, I have recourse to you for an explanation of this passage. As it is a proposal, not a description of any place he had seen, it is possible this famous writer may not have exactly understood the subject he was handling. *A. H.* [No Hornbeam is evergreen; but, like the Beech, it will, when clipped, retain its dead leaves during winter.]

Underhill's "Sir Harry" Strawberry.—"I recommended," says Mr. Beaton, "two sorts of the Strawberries exhibited at the last Chiswick fête, to my late worthy employées, Sir William and Lady Middleton, as most useful in the dessert, but whether or not they are of good flavour is more than I know; the kinds were the Bicton White Pine, a large white berry, that will make a most useful change in a dessert for great or small parties, and a very dark one named Sir Harry. This last was sent by Mr. Richard Underhill, of Edgbaston, near Birmingham." Having for many years had much experience, and taken great interest in the cultivation of fruit, I called upon the gentleman just mentioned for the purpose of making more particular inquiries respecting his seedling, and possessing myself of that information as to flavour, &c., which Mr. Beaton could not give. Mr. Underhill politely invited me to walk through and inspect his beds, when I was perfectly astonished at the enormous size and deep colour of the fruit, combined with the excessive cropping of the plant. I then tested the flavour with Keens' Seedling and British Queen, both equally well ripened, when the superiority of Sir Harry to either was at once so evident that I pronounce it the most exquisitely flavoured berry I have ever tasted. It is both firm and juicy, and carries its rich red colour entirely through it. The other distinguishing characteristics of the plant are these—its leaves are few, and it spreads its bearing branches out so wide as to thoroughly expose the fruit to the full influence of sun and air. *James Boucher (formerly Gardener to the Lady Olivia B. Sparrow), King's Heath, Worcestershire.*

Notices of Books.

The Ferns of Great Britain, illustrated by J. E. Sowerby; the Descriptions, &c., by C. Johnson. Small 8vo. Part I.

THE prevailing love of Ferns has led Mr. Sowerby to produce the present work, in which all our British species are to be represented by coloured or half-coloured figures engraved on copper. Each number is to contain six plates, and the work is to consist of eight numbers. The figures are carefully drawn, and Mr. Johnson's letter-press is satisfactory. We only wish he would call a leaf a leaf, and not a frond—and an indusium an indusium, and not an involucre, which an indusium is not. His directions for cultivation are clear, and evidently the result of his own observation of the habits of the plants. He has the good sense to reject Mr. Newman's preposterous nomenclature. When finished the work will form a handsome volume. Mr. Johnson's account of Polypodium calcareum may illustrate his manner of treating the subject.

"Apparently confined in its natural growth to limestone districts. Sir J. E. Smith first noticed it as a distinct species, and it is perhaps more frequent than generally supposed. In the rocky parts of Derbyshire it is far from uncommon, occurring among Grass and bushes in broken limestone and tufa; the Cheddar cliffs and Ingleborough are other stations; and the growing specimens in my garden are from the vicinity of Kenilworth, where it accompanied P. Dryopteris, a species with which it has often been confounded, although in habit and other respects very dissimilar. The rhizoma is thicker and less spreading than that of the latter plant; the frond less distinctly ternate or three-branched, the lower branches being shorter than the terminal or middle one; all the three are rigid, expanding upward on the same plane, and not at all drooping. The colour of the frond is of a dull green, owing to the presence of numerous minute stalked glands that give a mealy appearance to the surface, and similar glands communicate a glaucous hue to the rachis. The sori arising from the extremities of the lateral veins of the segments form a more distinct intramarginal series than those of P. Dryopteris, and generally become confluent when the thecæ open. Being of less compact growth than the last species, and more rigid, it is a much less ornamental plant; but it bears exposure better. Most persons who have had it under cultivation complain of its liability to die off, but I believe this to be the effect of confinement and superabundant moisture; left to itself, few Ferns are more hardy, but it likes pure air and perfect drainage. Even in the wild state it cannot be styled a 'free-grower;' and being a very local plant, its natural condition must be considered as much as possible in our efforts to naturalise it in the Fern garden. It flourishes best on a sloping bank, planted near the surface, with an admixture of lime rubbish to the ordinary compost, the ground about it being studded with fragments of stone or burs from the brick-kiln, to prevent evaporation. Under these circumstances it does not seem to be injured by daily exposure to four or five hours of the midday sun. If grown in pots they should be large, and about one-third filled with draining material."

Piercy's Popular Tales (Groombridge, 12mo) are more amusing than sound, if to be judged by the story of Buffon and the Golden Pheasant. The writer could know little of vegetable physiology when he made the great naturalist feed a Rose tree with coloured water, and afterwards detect the colour in the branches. Does Mr. Piercy require to be told of the common fact that colouring matter will not enter the roots of a plant? This tale should be altered in a book intended for young people, and so far as manner and style are concerned, well suited to them.

New Plants.

73. QUERCUS RIGIDA. *Willdenow.*

THIS is one of the Oaks the existence of which within the possible operations of the troops in the East we mentioned at page 387. It forms a tree, with very hard, flat, hairless leaves, the ends of whose toothings end in

a sharp firm point; they are on short stalks, and are distinctly heart-shaped at the base. Dr. Sibthorp found it in some part of the Morea; our own specimens are from Broussa. It is probably the same as a Quercus Libani found on Lebanon by Olivier, whose figure is copied in "Loudon's Arboretum," p. 1932, t. 1826.

In Armenia occurs abundantly another species of Oak—if it is not a form of that now mentioned—with larger leaves, on much longer stalks, and much deeper,

longer-pointed, and more irregular indentations. This, too, of which we have specimens before us, from Mr. Brant, H. M. Consul at Erzeroum, for whom they were collected by Dr. Dickson, would be an extremely welcome addition to the Oaks in English cultivation.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—It may interest Orchid growers to know that the great plant of Lælia superbiens in the curvilinear stove has again thrown up four flower-spikes, and that there is reason to expect that more may yet be produced. This makes the fifth or sixth year in which this magnificent Orchid has bloomed, without ever missing a season, and therefore the appearance of its handsome blossoms annually may now be looked forward to with certainty. The plant itself is in excellent health, and the spikes vigorous and strong.

An Allamanda cathartica, which spreads over the interior of the span roof of the propagating house, is at present one mass of yellow blossoms, a condition which it never fails to be in every year about this time. It is growing in a pot, and, with the exception of pruning it back every autumn to the well ripened wood, it requires nothing more than the most ordinary treatment. In another division of this house were plants of M. Van Houtte's Aphelandras, such as have been shown at our metropolitan exhibitions this year, together with Scheeria mexicana, a Gloxinia-like plant of considerable beauty, and examples of the Double Yellow Brugmansia (B. flava) in a very young state.

In a cool pit was Glossocomia clematidea, a white or rather very pale blue bell-flowered plant, obtained from the Russians; although not striking, yet on account of the singular and really handsome combination of colours in the interior of the little drooping bells, it is certainly well worth cultivation. Associated with it were Campanula primulæfolia, a hardy herbaceous plant which has not yet flowered in the garden, and a species of Antigonum which is expected to prove a valuable climber. An Orange Globe Amaranth was producing a few stray flowers; it is a fleshy rooted species, which may possibly turn out to be a useful late autumn and winter-flowering plant.

In the conservatory the white Brugmansia is still in blossom; but the huge specimens of the red one are nearly over, when they will be pruned "hard in" and cleaned preparatory to their pushing fresh growths for another crop of flowers. The Orange Cestrum is now coming finely into blossom, and for a large house like this nothing can possibly be handsomer. The different Tea roses planted along the sides of the paths have likewise been and are still in beautiful condition, while on the shelves are fine bushes of Calceolaria rugosa and the white variety of Trachelium cæruleum. The latter makes a capital plant for greenhouse or conservatory decoration at this season, the numerous great corymbs of small white flowers, most symmetrically arranged, having a pleasing effect. It is a biennial, the seeds of which, in this instance, were sown in March, 1853. Young plants of Selago distans, Chrysanthemums, and Japan Lilies, &c., are now being shifted and grown on for the winter decoration of this house.

In the open ground, American plants are making fine growth, and the ill effects of the winter on most things have now all but disappeared. Even the Mexican Pinuses, which a short time ago looked as if they had been entirely killed, have now made fresh foliage, and are fast recovering. At present P. apulcensis is the most naked, but that is also putting forth young leaves.

On the conservative wall the white variety of Ceanothus azureus is now in full blossom; it endured the winter unhurt, while C. azureus was killed. The Mount Etna Broom (Spartium Etnense) on the same wall is also coming into blossom, its branching head of yellow flowers rising some distance above the wall.

Of Roses, a bed of foot standards, Bourbons, which had been wintered on Mr. Rivers's plan (*i.e.*, in a cool frame packed closely together, with their roots covered with ashes) are doing well. When winter approaches they will be again taken up and stowed away as before, to be replanted next summer. They are thus wintered free from frost, and their flowering is made a matter of certainty.

Some of the young fruit trees in the orchard house, though only dug out of the open ground last spring and potted, have nevertheless produced a few good Plums and Pears. Among the latter, Beurré d'Anjou has two, and Baron de Melo five fruit, and among the former a small tree of Reine Claude de Bavay has 18 Plums on it. Two seedling Nectarines from the Stanwick are thriving young trees, which may probably fruit next year. A few Figs will possibly ripen this season, and there is plenty of young fruit for next year's crop. One of the Potato Yams alluded to at pp. 467 and 486 has been planted in the bed of this house; the other has been placed in the open border. Both appear to be thriving.

In the lean-to Vinery a ventilator, similar to that represented and described at p. 485, has been fixed. An opportunity will therefore be afforded of testing its value. It may be mentioned, however, that the inlet in this instance appears to be the shaft next the back wall, while, according to "J. P. S.," it should be that furthest from it. No mildew has as yet attacked any of the Vines, either in this house or elsewhere in the garden this year, except those on open walls, where a dusting or two with sulphur has stopped its progress.

In the orchard department, Apple trees are very much affected with American blight, which has to be continually washed off them by syringing them well with a powerful garden engine. Gooseberries and Currants are nearly spoiled by aphides, honey-dew, and a black sooty-looking deposit, both on the leaves and fruit. The latter, indeed, is so much covered with it that they have to be washed, or otherwise cleaned, before they are fit for use. These evils are not confined to the Society's Garden, but are prevalent in the adjacent market gardens, and, we believe, all over the neighbourhood. Of ordinary orchard fruit, there is none this year; and therefore the very many varieties that remain to be proved must stand over till a more favourable season has furnished the means of doing so.

The haulm of Potatoes in the kitchen-garden is fresher this August than it has been at a similar period in any year since 1845, and the tubers are as yet apparently free from disease. This remark applies to Potatoes in the garden generally under all kinds of circumstances, whether earthed-up on Mr. Aldborough's plan or grown in the ordinary way; all, with the exception of a stray stalk here and there, are alike sound. Of French Beans it may be mentioned that the Newington Wonder, a dwarf-growing sort, has borne most abundantly this year. The Haricot noir de Belgique is a stronger grower, and usually a good kind; but this year it has not done so well as the Newington Wonder, which has proved itself to be a most useful variety.

FLORICULTURE.

Culture of the Pansy.—The following instructions may be useful to amateurs beginning to grow this flower for the first time. Having fixed upon the situation for your bed (one having a south-eastern aspect and well sheltered from all winds is the best that can be selected, taking care that it is not so overhung with trees as to cause the plants to be drawn, or where they will catch the drippings from the boughs), at any time between October and February mark out your ground in plots 3 or 4 feet wide with 1 foot alleys; remove the soil from the beds to the depth of 8 inches, and fill them to the height of 3 inches above the alleys with previously prepared compost, the roughest or coarsest portion of which should be made use of first, reserving the finer part for the surface. The next operation to be considered is planting; for this choose a dry day, towards the latter end of March or the beginning of April, and having first neatly raked the bed, proceed to mark off the intended rows at one foot apart, and when planting leave a space of at least 10 inches between each plant. After planting, it would be advisable to turn a garden pot over each plant for the first day or two, to shade it from the sun, wind, or frost. If there has been frost during the night, be very careful not to uncover them if the sun be at all likely to shine. Pansies love a moist still atmosphere, and are very impatient of wind; all sudden changes are also very prejudicial. Several of your readers will have remarked that if a hot sun succeed rainy weather, many of the plants begin to droop, and would soon die off if not shaded. The same effect is also produced when a bed previously shaded is suddenly exposed to the heat of the midday sun. If you find any plant thus affected, place a hand-glass over it, and form it into cuttings. But after all due care and attention have been bestowed, it will frequently be found that some of the plants fog off. This has been attributed to the wire-worm, but I have never found that pest at or in the roots of any Pansy I have taken up, which I invariably do when any of the plants fall prostrate. Strength or freshness of the manure, and its being too retentive of moisture, have been assigned as other causes; that this disease has been accelerated by them I have no doubt, but it cannot be the only reason, as they very frequently fog off in poor sandy soils. Perhaps some of your readers can suggest the true cause. Any person who may wish to send flowers for exhibition will be quite unable to compete successfully, unless he covers his beds at least a week previously to each show, to protect the plants from being battered by the wind or rain, or faded by the sun; in hot weather it will prevent excessive evaporation, and in cold keep the temperature more uniform. The frame for the cover should be at least 3 or 4 feet above the bed in the centre, and supported at the four corners on posts, at about 8 inches from the surface, to allow the free circulation of air; it may be made similar to a Tulip frame. One of the greatest enemies the Pansy-grower has to contend with is the slug; during one night it will make as great ravages among the blossoms as will require a week to replace. The best method to rid yourself of these intruders is to water the bed with clear lime water during the evening, after a shower of rain (when they come out in great abundance); but any person wishing to show, must carefully search for them both morning and evening. They generally secrete themselves under the leaves or close to the roots of the plants. In order to guard as much as possible against the depredations of slugs, &c., let your beds be edged with slate or stone, which affords no harbour for them, and always looks neat. There is only one other remark I would wish to make concerning the general management of these plants, namely, never to water your beds even in the driest season, but in its stead, if continued hot weather is expected, I would advise that fresh cow manure be placed round the base of each plant, which, by preventing too rapid evaporation, will be amply sufficient to preserve a due amount of moisture about the roots. For the propagation of old and known varieties about the middle of this month, take strong short-jointed cuttings from those plants which are the healthiest and have produced good flowers during the season, and strike them in a shady bed made of equal parts of silver or sharp sand, leaf-soil, a little bog earth, and garden mould; for the first few days they should be covered with a hand-glass, and shaded from the sun, but no protection will be required afterwards. When the cuttings are sufficiently rooted, which will be in about three weeks or a month, plant them in good sized pots, and let them stand in a dry situation till the frost commences; the pots should then be plunged in cinder ashes in a cold frame, and kept quite dry, but air must be given as often as practicable, particularly in spring. When the frost is severe cover the frame with a mat, which must not on any account be removed during the day, if the sun shines; more plants are lost in the spring, especially by not attending to this rule, than by the severest frost. New varieties of course must be raised from seed, which may be sown at any time from March till September, either in pans or in the open ground. In about six weeks the seedlings will be ready to plant out, but if sown so late in the year that they cannot be removed, the seedlings will require some protection during the winter, either by a frame or otherwise; they can be planted out early in the spring. As a general rule, Pansy seed should be sown as soon as convenient after being gathered; for if allowed to remain some time unsown, vegetation is much longer in taking place, and many of the seeds will not come up at all. Seed should be saved from those plants which have the best shaped blooms; and if these be fertilised with the pollen of other flowers, which have bright or good eyes, it may have a good effect. The seed-pods, when ripe, become erect, and open on the first fine day, and if not gathered, would shed in the course of a few hours during fine weather; therefore the beds should be looked over at least once a day, and such pods as appear ripe should be gathered. It only remains to notice succession beds, which it will be necessary to have, in order to ensure a continuance of blooms; for this purpose I would recommend that the first cuttings which can be obtained be taken from the spring plants, and, when struck, be planted out in a bed, to bloom in the autumn. The treatment of the plants will be the same as before directed, but the situation of the bed must be due south. I may add that the whole of the remarks I have just made are the result of several years' practical experience in the cultivation of this plant. *D.*

Miscellaneous.

Lecture on Peat Charcoal. By Prof. Way.—Prof. Way remarked (says the *Chemist*) that, independently of the noxious gases resulting from the putrefaction of animal matter generally, and which consisted principally of sulphuretted hydrogen and sulphuret of ammonia, each particular animal substance, excretion or otherwise, had its *peculiar* odour, which, although abundantly perceptible by the senses, and, in many cases, as in musk, almost inexhaustible, was inappreciable in weight; therefore, by deodorising a large amount of odour, it was not to be inferred that a large amount of manuring matter was thereby secured. He then enumerated the various single and double deodorisers that had been employed. He referred to Sir William Burnett's excellent application of chloride of zinc, and to the ordinary chloride of lime; to gypsum (sulphate of lime), and its conversion in ammoniacal atmospheres into sulphate of ammonia and carbonate of lime; to the agreeable odour of pure ammonia, and its power of giving intensity to odours of a disagreeable character, which intensity was lost when the ammonia was withdrawn; to sulphate of iron (green copperas), which when powdered and thrown into tanks turned black, on account of the sulphuret of iron formed on the decomposition of the sulphuretted hydrogen present. He then proceeded to the consideration of charcoal as a deodoriser. He gave an interesting statement of the peculiar action of charcoals in general, arising, he believed, from the great amount of surface their spherical interstices presented, and of the peculiar action and superior value of animal charcoal over all others. He referred to the theory he had been led to form of this peculiar difference, and to a very successful imitation of animal charcoal, which he and Mr. Paine had made, in reference both to deodorising and decolourising properties, from the light porous silica-rock, found on Mr. Paine's estate in Surrey, and when broken up and steeped in heated tar, was put into a gas retort, where the tar was burnt off in the state of very pure gas, and a residuum left of the new silicated charcoal in question. He explained that in charcoals it was not the amount of carbon they contained that constituted their value, but the mode in which the carbon was distributed; that animal charcoal contained only 10 per cent. of real carbon, while wood charcoal contained 90 per cent. He referred to the large amount of water, 50 or 60 per cent., which peat charcoal took up, and to the fallacious dry state of the manures, with which this water-carrier was mixed. He feared this mode of introducing water in a latent state into manures, in many cases, gave a turn in the scale more in favour of the manufacturer than of the farmer. He doubted whether peat charcoal could be used economically for the purpose of soaking up tank-water; if not, he feared it would prove of no advantage, in other respects, as a

remunerative agent to the farmer. It had been long before the public, but had not progressed in market value as it would have done had its application been successful. He considered it to lead to much error in practice, that the exact nature of the action of charcoal on ammonia was not better understood by the public. Fresh burnt charcoal would absorb a large quantity of ammoniacal gas, but it was a mistake to suppose that it would consequently abstract ammonia from a liquid impregnated with it: on the contrary, water had the power of displacing from charcoal the whole of the ammonia it had received in a gaseous state within its pores. Peat charcoal did not either make manure or separate it from sewage; it simply rendered manure portable. He exhibited a striking experiment, showing the power of *dry* peat charcoal to arrest odours. Two open tumblers were half filled with the most offensive sewage-matter Professor Way could obtain, and the surface of each mass covered with a film of thin paper and a thin bed of powdered peat charcoal resting upon it. These tumblers were in this state handed round to the members, who ascertained the perfect manner in which the sewage-matter was thus rendered no longer offensive to the smell. He then gave an interesting account of the process of Mr. Stothert, by which sewage-matter was reduced, by a double action of purification, into clear water and inodorous precipitate —a process admirably adapted for sanitary purposes, although not for those of agriculture, as the more valuable manuring matters were held in solution and carried off in the pellucid liquid, while the precipitate was comparatively an inert mass. *Mechanics' Magazine.*

Monograph of Tropical American Oaks. — Dr. Liebmann, of Copenhagen, the distinguished traveller in Mexico, and the worthy successor of Professor Hornemann in the botanical chair of the University of Copenhagen, has in a very forward state a history, with numerous figures (we believe, in folio), of the Oaks of tropical America. His own collections of these are very considerable, and those of other herbaria have been made available to him; and we are sure that the publication will be as acceptable to all botanists as it will be honourable to the author. We learn that here, as is the case in all extensive genera, Dr. Liebmann has found it necessary to reduce very considerably the amount of book-species. *Hooker's Journal of Botany.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Now that there is a profusion of flowers out of doors, it will not be possible to maintain the interest of this house, except by keeping it furnished with handsome specimens of showy plants in first-rate condition; and, with proper convenience, this is no difficult matter at this season. Nothing, therefore, should be brought here at present that is not a fair specimen, and well bloomed; nor should a single plant be allowed to remain a day here after it begins to get shabby, for it seems a waste of means, and certainly betrays bad management somewhere, to occupy glass structures with plants of inferior interest to such as are plentiful in the open air. It is not desirable in our opinion, however, to crowd the house with flowering plants, but the aim should rather be to have a moderate number of handsome specimens effectively arranged, which, while flowers are so plentiful out of doors, will be vastly more interesting and pleasing than a larger amount of floral display from plants of no individual interest or merit. This kind of display may be agreeable enough at a season when flowers are scarce, but it is useless to hope to maintain the interest of a house at this season by this kind of management. A thin arrangement of the pot specimens will also be advisable, on account of the permanent occupants of the beds or borders, which at this season should be allowed plenty of space, in order to secure strong well ripened wood; for unless this is obtained they will not bloom finely. Look over former directions, and use every means to keep insects in check, and to make order and neatness conspicuous in the arrangements of this house. STOVE.—Such of the inmates here as are intended for the decoration of the conservatory in autumn and early winter should be carefully looked over, shifting such as are likely to want more pot room, without unnecessary loss of time, so as to get the pots well filled with roots before their flowering season. Also keep the shoots tied out rather thinly, and expose the plants to as much sunshine as they will bear without scorching their foliage, in order to promote stocky growth. Give clear weak liquid-manure water to young growing specimens, and repot any of these that are intended to have another shift this season, so as to get the pots well filled with roots before winter. Maintain a moist growing atmosphere, and ply the syringe vigorously upon any plant at all infested with red spider. ORCHIDS.—The growing season is far advanced, therefore encourage any backward plants with plenty of heat and moisture, while this can be safely done. See that plants growing on blocks and in baskets are properly supplied with moisture at the root, and to prevent any mistake handle every plant at least once a week, and immerse those found to be dry in tepid water until the material about their roots is well soaked. Syringe lightly morning and evening, and sprinkle the floors, &c., frequently, so as to keep the atmosphere thoroughly moist.

FORCING DEPARTMENT.

PINERY.—Attend carefully to growing stock, keeping the bottom-heat regular, and the atmosphere warm and moist, and use every means to secure rapid vigorous growth. This will not be obtained, however, unless all is right at the root, therefore attend well to watering, and never allow any of the plants to become pot bound. Give air moderately to young stock, and shut up early in the afternoon, giving the plants a gentle wipe with the syringe, and the house a good steaming by wetting every available surface. Continue to pot a few suckers, as they can be obtained of sufficient strength, and do not allow too many to be produced by one plant, as they weaken each other. Indeed we never allow a sucker to grow to any size that is not likely to be wanted for stock, and unless in the case of any scarce sort, never more than two on a plant. Plants growing in beds of soil must be very carefully attended to with water, giving enough at each application to moisten the whole body of soil; for unless this is attended to, the bottom of the bed will sometimes get quite dry, while the surface is moist. VINERIES.—The inside borders of houses intended to furnish a late supply of Grapes should be well soaked with manure water as soon as convenient, so as to allow of their becoming dry before the damp cloudy days of autumn set in, for damp will be most injurious then, and anything likely to cause it should be avoided. Muscats beginning to ripen should be assisted with fire heat, for it is hardly possible to ripen these properly at any season without artificial heat; and those for late use should be pushed on, so as to get them ripe by the end of next month at the latest; for those ripened later in the season are seldom of good quality, and we have always found them to hang better when ripened early in autumn than those that were ripened later in the season. FIGS.—The second crop on the earliest trees will be fast advancing towards maturity; as soon as the fruit begins to ripen the atmosphere should be kept dry and rather cool, giving air freely every fine day, and using a little fire on wet cloudy days, to prevent damp and allow of a gentle circulation of air. Use every care to keep the foliage clean and healthy, and clear of insects, and do not crowd the young shoots. MELONS.—Plants on which the fruit is ripening should be kept dry at the root, and freely exposed to air on fine days, avoiding moisture in the atmosphere as far as can be done without injury to the other plants. Do not allow the bottom heat to decline where the fruit is setting, which is a frequent cause of the young fruit dropping off. Keep a watchful eye on the foliage, and guard against red spider, which, if once allowed to establish itself, can hardly be removed without greatly injuring the tender foliage.

FLOWER GARDEN AND SHRUBBERIES.

Now that the effect of the present arrangement of the colours in the beds can be fairly seen, there is an excellent opportunity for noticing any mistakes, and determining upon the arrangement for next season, and this should be done without delay. When it is decided what each bed is to be occupied with next season, a plan of the garden should be made, writing the names of the plants on the beds according to the arrangement decided upon. This will be of the greatest service in showing at any time what quantity of each kind of plant has to be propagated; and unless some method of this kind is adopted, it is not unusual to find at planting out time that there is a scarcity of some things and too many of others, whereas, those who have their plan to refer to can tell at a glance the exact number required of everything, and avoid mistakes in getting up too many of one thing and too few of another, and all the anxiety and confusion of working without a well defined object in view. Dahlias are growing very rapidly, and will require to be gone over frequently to keep the side branches securely tied in; for when left untied, they are readily broken off by a thunder-storm. Hollyhocks must also be securely tied to their stakes. Continue to remove dead flowers from Roses, and give plenty of manure-water to the autumn-blooming varieties. Plant out rooted cuttings of Pansies, &c., in nursery beds in a shady situation, keeping them well watered if the weather proves dry until they get established. Finish budding Roses at once, if not already done, and also get border Carnations, Picotees, and Cloves layered without farther loss of time.

FLORISTS' FLOWERS.

Take care that Carnations and Picotees do not suffer from drought. Layering may be commenced with those shoots sufficiently long. Cross breed flowers which have the desired properties; the anthers will be found low down in the calyx. The operation is a pleasing one and attended with but little difficulty. Mark seedlings, which promise well, and pull up those which are not up to the mark. Plant out Pink pipings, and put in a second crop of cuttings; these will often strike root, and make better plants than the early ones. Look over and divest of their loose skins the bulbs of Tulips. Arrange the rows of the bed so as to be ready for planting. Discard all impure flowers, whether stained in the base or on the stamens; whatever good qualities the flower may possess, these defects render it utterly worthless. Give Dahlias and Hollyhocks abundance of water; tie out the branches, and disbud the former where required, and shorten the flowering stem of the latter.

HARDY FRUIT AND KITCHEN GARDEN.

The main breadth of Spinach for furnishing the winter supply should be sown at once; also prepare ground for winter Onions. Get a good breadth of Lettuce and Endive planted out for the autumn supply, and sow some hardy sort of Lettuce for planting out against south walls, or in frames, to come in after the frost cuts off the out-door supply. Dig down exhausted plantations of Strawberries, and get the ground planted with winter stuff, if there is not already sufficient of this planted; and make a further sowing of Turnips, if these are likely to be scarce before the winter is over. Attend to cutting and drying herbs as they are ready, and do not allow Shallots to remain in the ground after the tops die down, as, in the event of wet weather, they will make fresh roots, which prevents their keeping. Get a good breadth of Cabbage planted thickly in rich ground to furnish winter greens.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 3, 1854, as observed at the Horticultural Gardens.

July and Aug.	Month Ago.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 16th, 1842—therm. 93 deg.; and the lowest on the 6th, 1833—therm. 35 deg.

Notices to Correspondents.

AUSTRALIA: *X Y Z* would do better in Canada than in Australia, if he has health, strength, industry, and a little money to start with. The difference between the passage money to Australia and Canada will be enough. Read Mr. Hutton's Canada, a little emigrant's guide noticed lately in our columns.

CAPSICUMS: *Weltonian.* When ripe and perfectly dry, grind or pound them into powder. You may do them in a mortar with a heavy pestle, or a pepper-mill will do.

DISEASES: *J. Rowe.* The Melon disease of which you have sent a specimen is very common in the county and neighbourhood in which you live, and perhaps elsewhere. My own Melons have suffered, but have not failed, in consequence of continual attention to the state of the atmosphere—proper, but not extreme shading, and cutting off the diseased leaves, a few at a time, close to the stem, with a sharp knife. Without this treatment my crop of Beechwood would certainly have perished. The diseased spots in damp weather are covered with a little mould, Trichothecium roseum, but the moment the air in the frame is dry it disappears; the fungus has nothing to do with the disease, which arises from atmospheric conditions, inducing a low state of vitality and imperfect organisation of the leaves. —*C M D.* The disease upon the Azalea leaves appears to be confined to the cuticular cells, and to be of the same nature as that which has been so prevalent in Vines, arising probably, as in their case, from the condition of the roots. The leaves, too, have evidently been affected by insects, which have probably aggravated the evil. It is impossible to say much on the matter without personal inspection of the locality and mode of treatment.—*B B J.* Your Grapes appear as if they had been syringed with water containing carbonate of lime. The white efflorescence effervesces strongly with sulphuric acid, and is certainly no vegetable production. Perhaps the Grapes were sound when transmitted, and if so, you have probably nothing to fear. At any rate the white patches do not arise from disease.—*M L.* Your Grapes seem to be affected very much in the same way as those of which we gave a figure (July 1, 1854), to which we beg leave to refer you. There is no indication of mildew about the berries. *M. J. B.*

HEATING: *J M.* No.

INSECTS: *Q L.* Your young Peach trees are infested with the Peach aphis (A Persicæ), and slightly also with thrips. Being young and healthy, the aphis has preferred attacking them, but the vigorous shoots of the older trees are equally liable, and the removal of the former will scarcely prevent the development of the aphides on the others in a season when these insects have abounded to such an extraordinary extent. *W.*

MIGNONETTE: *B C.* The cause of your Mignonette becoming drawn and straggling may be ascribed either to its being grown in a shady situation, or to its having been allowed to become too crowded. Tree Mignonette is obtained by selecting and potting a vigorous young plant, the flowers of which are to be pinched off as often as they appear during the first season. It must be repotted as occasion may require; the lower shoots must be removed in autumn, and the plant must be kept during winter in a room or greenhouse above the freezing point. The second season it may be treated in a similar manner; and the next year it may be allowed to bloom, which, with care, it will continue to do for several years.‡

NAMES OF PLANTS: *R S.* Periploca græca.—*W B J.* We do not recognise the leaf of your "celestial tree." We have spent an hour in a vain attempt to identify it. There is nothing to distinguish it from ten thousand other pinnated leaves.—*Diss.* Erythræa pulchella, with white flowers.—*Godwin.* We really can see nothing worth remark in your Delphinium mesoleucum. —*A M.* Begonia petaloides. The Ferns are so shrivelled that nothing can be said about them.—*P G E.* Oncidium umbrosum, and what seem to be leaves of Drymonia punctata.—*Scotia.* Cerasus Padus, the common Bird-cherry.—*M P.* Catananche cærulea; a double Campanula glomerata; and some Coreopsis, apparently C. Atkinsoni.—*Biddulph Grange.* Acineta densa, no doubt.

STRAWBERRIES: *H. Doubleday.* Between the Strawberries you sent, correctly under the name of Eleanor, and those you sent as the Nimrod, we can see no difference.‖

TRANSPLANTING: *T S P.* The best time for moving your trees and shrubs is the end of August or September.

VETIVER: *C.* The vegetable matter which is employed by furriers, in Montreal and other towns of Canada, to destroy moths in furs, &c., having some such name as "Vettie vert," is probably the root of the Indian Grass called Anatherum muricatum.

WALLS: *Inquirer.* There is no better mortar than what is made from stone lime and sharp river sand. Use it any time in the course of this month or the next. We do not approve of tying fruit trees against walls to a wire trellis. When used it is strained horizontally.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PRAISER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CABNE, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodorizer and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street.

REAPING AND MOWING MACHINES.—CAUTION.—Notice is hereby given, that any person or persons infringing any of the Patents of Cyrus Hall M'Cormick, for Reaping and Mowing Machines, or making, or vending, or using, or exercising any Machines which in any way intringe upon any such Patents, will be proceeded against according to law. The main features of M'Cormick's Patents consist in a zig-zag serrated cutting blade, spear-head shaped holding fingers, and a gathering reel.
E. J. & H. LAWFORD, Mr. M'Cormick's, Solicitors.
Draper's Hall, 27 Throgmorton Street, London. Aug. 5.

THE ADVANCE OF SCIENCE IN AGRICULTURE.
RICHMOND AND CHANDLER'S unprecedented celebrity for their improved CHAFF MACHINES and CORN CRUSHERS, achievable only by intrinsic merit, has secured for them the highest character in the trade, together with the confidence of the public, whether as regards true economy or the unapproachable finish and sterling quality which characterise all their productions, and render them worthy the reputation of a Manchester manufacturer.
The most distinguished authorities in all civilised countries report their unqualified satisfaction with the highly beneficial effects resulting from the use of these justly celebrated Machines, and with the now established fact of their not being subject to any of the contingencies inseparable from other machines, they are calculated to meet with general approval in the present advancing state of agriculture.
Address—RICHMOND & CHANDLER, Salford and Manchester and 32, South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Private instructions in Chemical Analyses and Assaying, will find suitable facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will take place on TUESDAY and WEDNESDAY, the 21st and 22nd days of November, 1854. Prize Lists, &c., to be had of THE Hon. Sec.—Salisbury, July 22.

REIGATE ASSOCIATION FOR THE IMPROVEMENT OF DOMESTIC POULTRY, for the Counties of Surrey, Sussex, and Kent, established 1852.—The Third Annual Exhibition will be held at the PAVILION, BRIGHTON, on WEDNESDAY, 22d, and THURSDAY, 23d of November next.

The Agricultural Gazette.

SATURDAY, AUGUST 5, 1854.

MEETINGS THE ENSUING WEEK.

WEDNESDAY, Agricultural Improvement Society—
THURSDAY, — at Armagh.
FRIDAY, —

OUR attention has been called by a correspondent to a note by MEILLE, on which a report has been given by MESSRS. DECAISNE, MONTAGNE, and TULASNE, in the "Comptes Rendus," respecting a disease very prevalent in France, arising from a kind of red rust, which attacks Wheat-glumes, and which is regarded by MESSRS. as a new species, *Uredo glumarum*, but differing very slightly from the well-known *U. rubra*. The ravages committed by this parasite appear are unfortunately very great, and threaten to verify there the bad character which it obtained in this country in 1846.

Either the parasite, or a form of the common red, we are scarcely prepared to say which, for, unless, on a comparison of dried specimens, we see no specific difference, is attacking the crops in several districts of this country, but without any prospect of serious injury; as the ears are partly abortive, the mischief appears to arise from the presence of a little maggot which feeds upon the Uredo, than from the parasite itself. However this may be, the blighted ears which we see in so many crops of Wheat this year are not due to any parasite, but to some radical defect in the plant, for in every case where they occur the base of the stem will be found to be diseased, and sometimes completely decayed.

Such is the character of the case which accompanied the extract mentioned above, and the same may be said of samples which we have gathered ourselves and received from correspondents. We do not, however, think that in those districts which we have personally inspected such ears are more common than in many other years in which we have observed them, and they have too small a proportion to the healthy portion of the crop to affect the produce materially. *M. J. B.*

WE need not direct attention to the reports of harvest prospects in another page, as at this season that is the all-important subject. It will be seen that there is unusual promise of an abundant produce of Wheat, and that Oats and Barley are good, much better than the very dry cold seed time led most of us to anticipate—that Beans are very generally injured by blight and fly in the south—that the Hay crop is unusually light, and much of it badly harvested—that the green crops generally promise well, and that there is a more general and earlier complaint of the Potato disease than there has been for several past years. A rapid journey northwards from London, and through several of the eastern counties of Scotland, enables us to add our testimony to that of correspondents in Fifeshire, the Lothians, and Berwickshire, as to the magnificent crops of all kinds which cover the ground. The Turnips already very generally hide the land; the Wheat is very fine, and the Oats and Barley are very good. Crops, too, are more forward as to ripeness in the Lothians and in Fifeshire than in the northern and central counties of England.

STEAM CULTIVATION performed by the agency of cutters attached around a horizontal shaft driven by an engine, is not exactly a novelty in speculation, however isolated and obscure may have been its practical trials. And, indeed, it has been suggested from the very first to connect other field-operations with that of simple tillage—that is, to make the locomotive engine, carrying a rasp or digging tool behind it, capable also of dragging a harrow, roller, seed-drill, &c., and even of having its machinery changed, so as to transform it into a steam reaping machine. Some individuals were greatly astonished when Mr. MECHI first announced his new steam cultivator, which "by a simple inversion of the machine," he said would be able to reap and mow—and one farmer of our acquaintance might wonder with sufficient reason, for he took the words to mean *a turning of the thing upside down!*—but we find the very same diverse ends proposed so early as 1847. In October of that year, Sir JOHN SCOTT LILLIE patented machinery for tilling, mowing, and other agricultural operations, by either steam or horse-power. A steam-engine and boiler placed upon a carriage, propelled itself by means of a peculiar shaped wheel or drum travelling along a rope stretched across the field from end to end, and secured by grapnels. The carriage wheels were supported from sinking into the ground by two endless chains made of long bars joined together by hinge joints, forming a sort of perpetual self-laid railway, laid down in front and taken up behind the carriage by skeleton-reels for the purpose, this being done solely by the progressing motion of the whole machine. Two double mouldboards or ridge-ploughs preceded the two series of bars, to open level gutters for their reception. It was not necessary to turn the apparatus at the end of the field, but only to shift it a distance equal to its own breadth sideways; for this purpose, an additional set of three carriage wheels were provided, being fixed transversely to the other, or straightforward set, and raised or lowered by means of a screw. Short wooden platforms were placed on each headland, for these transverse wheels to travel on, in the operation of shifting to another row or furrow, the carriage being hauled forward by means of what are called "crabs." The engine drove with considerable velocity a shaft placed across the machine, which being armed with a series of bent prongs or tines, tore up the soil as the machine advanced, being immediately preceded by fixed coulters or scarifiers. The mowing apparatus consisted of scythes projecting horizontally in front, and fixed upon endless straps or chains, which, passing round drums on each side, were made to bring the scythes rapidly across the front of the machine, this propelling itself slowly as before. As this ingenious contrivance must have had enormous weight—at least, if of sufficient power to pulverise hard earth—and, as it is not designed to travel solely over the unstirred land, we imagine that it never could become generally useful. Whatever may be said about its peculiar methods of propulsion, both in the forward and sidelong directions, it seems pretty clearly to fail in this indispensable condition—the situation of the tool-part, either behind or on one side of the carriage, so that the latter may always stand upon firm ground. We may also lay down as a rule that, as the effectual working of a rasp (such as inventors now generally agree to be the best form of tiller) cannot be insured without an equable and perfectly uniform rate of progression; and as this can never be obtained so well as by driving round the carriage wheels directly by the engine, all schemes involving chains and ropes, or *any second power for propulsion extraneous to that actuating the rasp itself*, must probably be futile.

Surely there are but few of the many machines in various branches of manufacture constructed to receive a material and cut it to pieces by a *rapidly* revolving tool (as saws, graters, grooving and planing machines, &c.) which can work if fed irregularly. In nearly all such contrivances, the feed is always strictly regulated by the speed of the cutter itself—so that this may always have its full supply of work, yet not be liable to stoppage by sudden gluts of the material. How, then, is it likely that a quickly revolving rasp-cultivator can perform its work if attached (as some have proposed) to a carriage drawn forward by horses? Now, hopeful and elated as we could not help feeling when Mr. MECHI announced to the world the arrival of Mr. ROMAINE, and pledged his own "agricultural reputation" that the new engine would answer its purpose, we begin to think it probable that the public will wait in vain for its success—simply because its rasp or cylindrical grubber is expected to turn at a speed of 240 revolutions per minute, while dragged forward through the soil by the unsteady fluctuating progress of walking, stumbling, or starting quadrupeds. Have any actual trials been made with this machine—and with what result? We earnestly hope that Mr. MECHI will give us a few intimations on this point, as it is of the utmost importance for inventors and the agricultural public to know, as soon as the experiments will admit, what principles of construction are found promising, and what defective.

We have not room this week for a description of the machine, but merely state as our opinion that a modification of its parts, so that it may be self-propelling, and riding upon broader wheels, would stand a better chance of succeeding. Its peculiarly light form of boiler and engine, if proved equal to their duty and free from all great objections, will be an encouragement to contrivers of steam cultivators; while its new method of gearing the motive power to the rasp may be of considerable suggestive value.

Our mechanical readers may obtain the printed specification, with plates of the drawings, at EYRE and SPOTTISWOODE'S, the Queen's Printers,—entitled "A.D., 1853, No. 1151, Specification of JOHN HENRY JOHNSON." *I. A. C.*

NOTES OF AN AGRICULTURAL TOUR IN IRELAND.—By MARTIN DOYLE.

I ASKED, at page 427, what would be the conduct of an English farmer, under the circumstances described as characteristic of the neighbourhood of Kilmallock. Assuming that the surplus native population had left their hovels by the wayside and lanes of his new farm, he would have to build cottages in convenient positions, if there were no adjacent villages in which they could be decently and commodiously lodged. He would have to make a complete clearance of a large proportion of the fences, by which easy and cheap operation his gain would probably be 5 per cent. of his acreage. He, or his landlord more properly, would have to erect suitable farm buildings, and, at least on the boundaries, hedge-rows, or walls. There are very extensive tracts on which, since the evacuation of them by the former occupiers, great improvements might be effected without any very alarming cost; many of the most unsightly, bleak, and poverty-stricken districts might be rendered, by the operation just suggested, and within two or three seasons, downs of pleasing appearance and remuneratively productive.

The nakedness of the district which I have been noticing requires, in truth, a fresh suit of green clothing. Woods and plantations, on inferior soils and waste places more especially, which have been from time to time cut away by improvident owners, ought to be re-established, and those admirable examples afforded by some of the undisturbed present, and many of the late proprietary, should be followed by the new purchasers.

Besides the levelling of old, worthless fences, and much draining in large districts, the new farmer would have to clean his arable land thoroughly, and where the occupiers had been of the poor class, to plough deeply, in order to bring it into proper tilth. But as the very heavy clays and chalks which are found in England are not encountered in Ireland, he would not require a larger plough yoke than a pair of stout horses to each plough; therefore he would save the cost of a driver and of a supernumerary horse to each plough team.

The land about Charleville, Doneraile, and Buttevant,

in the north-east part of the county Cork, is very fine,—splendid for sheep feeding—but presenting to view very few sheep; and as to the folding them on Turnips or early Vetches, I had not noticed a single symptom of the existence of this most beneficial system through the whole of my journey; nor have I subsequently seen any marks of it. This practice, however, no doubt, after the present transition period shall have passed, and a new agricultural era arisen, will be accomplished in a country so pre-eminently adapted by soil and climate to Turnip culture and sheep husbandry. The land south of Charleville is very fine; limestone abounds in that direction, and on the northern side the limestone gravel, so peculiar to Ireland, and so efficacious in reclaiming moory soil, is abundant. All around me I could distinguish undulating grounds of the most fertile quality, fit for any purposes of husbandry, and rich plains for meadow, or feeding the large Leicester cows, for which that portion of Ireland used to be distinguished. From Charleville to within a short distance of Mallow on the south, and towards Tipperary and Waterford on the east, the soil is calcareous, and of admirable quality, and limestone abounds. As stone and lime-mortar are principal materials in the erection of farm-houses, offices, and cottages, the abundance and cheapness of these materials in this and one or two other districts of the same county, lead us to wonder and lament that with such facilities for building, and such land for cultivating, so little has been done; and our surprise is increased on learning that among the proprietors of this fine part of the county of Cork are some of our most distinguished noblemen.

The north-west part of the county—in which Spenser lived and wrote—is less favoured by soil, excepting on the eastern quarter, but adjoins a range of high and rocky mountains on the west, which give it shelter from the Kerry side and its Atlantic breezes. There some property is intrinsically valuable beyond the ordinary averages, from its being a coal bed which has been worked for a long period. The coal is of the anthracite kind, in beds from 2 to 3 feet thick, and the increased facilities that might be rendered by truck railways, for conveying the small coal or culm to the limestone districts, and for re-conveying limestone to the argillaceous soil of the coal district, would impart a double benefit, and greatly tend to the progress of agricultural improvement there.

As we approached Mallow, where I had passed some weeks more than half a century ago, through a tract of moorland and yellow clay, I found that no progress has been perceptibly made there—the same bleakness, the same air of general wretchedness around. A glimpse of the suburbs was quite enough to tell a tale of human misery, and of the retrogression, rather than the advancement, of the population of that quarter, in the scale of civilisation. The chief cause of this long-existing state of desolation is perceptible at a glance. The soil is wretched, the limestone district being discontinued; and a poor dry moorland soil succeeded. This continues for a considerable stretch; beyond which, southward, the same sort of greystone, which prevails in the north-west of the county, reappears.

Within 3 or 4 miles of Cork, the indications of improvement and prosperity appear; and strange would it be if, on the confines of a very populous and apparently prosperous city, and within easy access to the bed of limestone at Blarney, on the west and the south side of the city, husbandry should not flourish. *M. D.*

PROSPECTS OF THE COMING HARVEST.

Home Correspondence.

Potato Disease.—On the Potato disease I would remark that it is only in some few instances, and among the early kinds, that disease as yet shows; in the tubers, they are more so, but not yet generally, affected in the leaf—there are very few cases in which the later kinds show disease, even in the leaf. It is too soon for the disease to be much developed, but it shows itself sufficiently to indicate its existence and its continued virulence. I think it does not admit of a question that it will be as generally and to an equal extent destructive as it was last year, and may cause about the same deficiency of crop—the greater number of acres under this crop this year balancing the later planting and earlier attack. The disease in its first attacks appears to require a certain approach to maturity, while in its later attacks two, three, or four weeks afterwards, it destroys indiscriminately all. The kind called "Scotch Downs," although suffering in the leaf, resists the disease very much in stem and tuber, which last continues to grow as long as any vitality remains in the stem. The drying of the seed tubers, according to the experiments of Professor Bollman, very probably will afford much security against the disease; last year, of 411 Potatoes—the produce of dried seed—only seven were diseased; the rest have kept sound to the present day. In my experiment this year with purposely late-planted Ash-leaved Kidney Potatoes, dried for a month in the kitchen chimney, I have found a very curious distinctive appearance, which promises well for security under this plan. I pulled up a score of shoots from among them, every one of which, down to their juncture with the seed tubers, were of a fine healthy white; on the contrary, the shoots I pulled from among the Ash-leaved, which had not been dried, were, with only two or three exceptions, very discoloured and rusty—an evidence, I believe, of incipient disease. *John Goodiff, Granard.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

MONTHLY COUNCIL, on Wednesday, Aug. 2: Colonel CHALLONER, Trustee, in the chair. Twenty-three new members were elected.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, submitted the monthly report on the accounts, from which it appeared that the current cash-balance in the hands of the Society's London bankers, was 776*l.*

FINES.—Mr. Simpson, Chairman of the Fines Committee, presented the report of that committee, when the Council ordered that immediate steps should be taken for the recovery of the fines for non-exhibition, and a list be laid before them at their next meeting of persons who should have failed to make those payments.

PROTESTS.—Mr. Barnett, senior steward of the cattle-yard at the Lincoln meeting, reported the protests made against awards of the judges on that occasion. The Council referred these protests to the investigation of the stewards, with a request that they would report upon them to the Council at their next meeting.

The following communication was received from the Earl of Clarendon, with the best thanks of the Council.

"Foreign Office, July 21, 1854.

"Sir,—I am directed by the Earl of Clarendon to transmit to you a copy of a list which has been sent home by her Majesty's Chargé d'Affaires at Lima, of those Islands and places in Peru where guano is to be found, and I am to request that you will state to the president and members of the Royal Agricultural Society that Lord Clarendon has transmitted another copy of this list to the Lords Commissioners of the Admiralty, and has requested that the admiral in command of her Majesty's squadron on the Pacific Station may be directed to make such a survey of the places named by Mr. Sulivan as containing guano, as the means at his disposal will enable him to undertake. Lord Clarendon has also instructed Mr. Sulivan to furnish the admiral with all the information he can obtain on this important subject.

"I am, sir, your most obedient humble servant,

"E. HAMMOND."

"To the Secretary of the Royal Agricultural Society."

NITRATE OF SODA.—Mr. Pusey transmitted various communications received from the Earl of Clarendon in reference to searches instituted for natural deposits of the nitrates. At Mr. Pusey's suggestion, Prof. Way had drawn up the following short memorandum of easy means by which saline depositions may be tested as to the amount of nitrates contained in them.

Characteristics of Nitrates of Potash, Soda, &c.—All the ordinary nitrates are readily *soluble in water*. The nitrate of soda crystallises in cubes. The nitrate of potash in long prisms. When exposed to a gentle heat the nitrates fuse, giving off oxygen gas. On this character is founded the most simple and certain means of distinguishing these salts from all other natural saline deposits—namely, to throw a portion of the supposed nitrate on red-hot fuel, when "deflagration," or a greatly increased and violent combustion of the fuel, will result. A mixture in which the quantity of alkaline nitrate is too small for the production of these phenomena, will hardly pay for importation into England. All nitrates are valuable, though not in an equal degree, for agricultural use.

J. THOMAS WAY.

FRENCH AGRICULTURE.—The following letter from Mr. Herbet, Consul-General of France in England, was laid before the Council, acknowledging, on the part of the Minister of Commerce and Public Works in France, the attention paid by the Council to the deputation sent by the French Government to the Lincoln Meeting, and offering for the acceptance of the Society a selection of agricultural works published in Paris under his Excellency's auspices:—

"Londres le 22 Juillet, 1854.

"Monsieur,

"Son Excellence M. le Ministre de l'Agriculture, du Commerce et des travaux publics, voulant reconnaître les procédés obligeants du Conseil de la Société Royale d'Agriculture d'Angleterre pour les délégués du Gouvernement Impérial, et désireux en même temps de témoigner du vif intérêt qu'il prend au travaux et au succès de cette honorable Société, m'a chargé de lui offrir, en son nom, divers ouvrages publiés sous les auspices de son ministère, et dont vous trouverez la liste ci-inclus. Je m'empresserai de vous la transmettre, dès quils seront parvenus à Londres.

"Ayant pu apprécier moi-même à de nombreuses reprises la bienveillance du Conseil de la Société Royale, c'est avec le plus grand plaisir, Monsieur, que je m'acquitte de la commission de son Excellence M. Magne. Il me reste à vous remercier personnellement pour l'extrême courtoisie avec laquelle vous avez constamment accueilli les personnes que j'ai eu l'honneur de vous adresser et les demandes que j'ai été chargé de vous soumettre.

"Veuillez agréer, Monsieur, les nouvelles assurances de ma considération très-distinguée.

"Votre tres humble et très obéissant Serviteur,

"Le Consul Général de France,

"ED. HERBET."

"J. Hudson, Esq., Secretary to the Royal Agricultural Society of England."

On the motion of Mr. Fisher Hobbs, seconded by Lord Southampton, this communication was received with the liveliest satisfaction by the Council, and a complete set of the Society's Journal ordered to be offered for the acceptance of the French Government, in acknowledgment of the valuable donation then announced to the Council.

His Excellency Lord Cowley transmitted to the Council, from Paris, a complete set of the Transactions of the Imperial Agricultural Society at Valenciennes, addressed to his care by the President of that body, for presentation to the Royal Agricultural Society of England, in acknowledgment of the set of Journals offered to the Valenciennes Society in the year of Lord Ashburton's Presidency, and transmitted through the Consul-General of France in England.

NATURE-PRINTING.—Messrs. Bradbury and Evans, of Whitefriars, presented to the Council a series of beautiful and striking specimens of their "nature-printing," or process by which vegetable productions may be printed off in their natural size and colour in almost perfect fac-simile. The objects selected for the series consisted chiefly of common wild flowers and well-known agricultural and other plants, of which both the strength and the delicacy of the details were given with daguerreotype exactness. These specimens were much admired by the members, and the value of such a process in an agricultural point of view fully recognised.

MISCELLANEOUS COMMUNICATIONS.—From Colonel Owen, conveying the thanks of the Board of Trade from the committee appointed by the Council to co-operate with Mr. Brandreth Gibbs, in reference to the French Exhibition; from Mr. Miles, M.P., President of the Society, transmitting a letter from the Agricultural Society of India; from Miss Bannister, of Steyning, details of the successful results attending her cultivation of the Dactylis glomerata, of which she forwarded to the council on that occasion various specimens, as well as of the hay made from it; from Mr. S. Clarke, of Crewkerne, on the Potato disease; from Mr. Hill, Medical Superintendent of the Clifton Lunatic asylum, inquiries on the management of sewerage; from Mr. Adderley, M.P., on the successful subsoil underdrainage of Mr. Dumolo; and from Mr. Pullan, of Chester, suggestion for a prize for the construction of a domestic corn-mill.

The Council having arranged that the prizes for Implements next year should be decided on the first Wednesday in December, appointed a General Carlisle Committee, and requested Mr. Fisher Hobbs to attend to the preparation of the land for the trial of implements. They then adjourned over the autumn recess to the first Wednesday in November.

LINCOLN MEETING.—We append here a fuller report than we have yet been able to give of the remarks on *the Agricultural Uses of Steam Power*, made in connection with "The Railway Companies" at the dinner of the English Agricultural Society at Lincoln. Mr. Wren Hoskyns said it was his misfortune to find his name opposite the last toast on the list, at that late hour when every topic of excuse for every supposed defect had been exhausted, and left to him but the last resource of simply trusting to the charity of his hearers all shortcomings of thought or language, in venturing to touch upon a subject unavoidably suggested by the toast—a subject allied to some cherished predilections of his own, yet too vast to receive justice from his or any other tongue—that of the giant power of steam; the power which had enabled them to meet together, the *primum mobile* of that splendid exhibition they had seen to-day. It might be called a singular chance, but what seemed chance and accident was but the singly-seen result of hidden causes—that the birth of the railway system, and of this great Society was coeval. They were born and had grown together, and had advanced year after year, mutually indebted, until increasing weight and superadded numbers began to present a problem of some difficulty to future meetings. But indebted as they were to the steam-engine on the rail, he felt it impossible, as a steward of the trial-yard, in which during the past week the comparative merits of nearly 60 steam-engines had been tested by the invaluable aid of the dynamometer—not to indulge the hope, now authorised by a premium of the Society, that the useful power which had been applied to almost every branch of human art and industry—that civilising power by which distance was overcome yet space retained, and which had already been applied to so many agricultural processes, might yet make one step more, and lend its aid to the actual task of cultivation itself. He must, however, acknowledge that the experiments hitherto made towards the application of steam to cultivation appeared to him to have proceeded too much on the supposition that ploughing, digging, or forking, or some of the other accustomed and conventional modes of tillage must of necessity be made use of. But if the steam-engine ever began to cultivate, and he for one would make the sacrifice—if sacrifice it still was—to declare his conviction of this result being ultimately attained, it would probably not be by any of these modes of operation. In point of fact, cultivation was as obviously independent of each and either of these processes, as they were each independent of the other; and he would take this opportunity of expressing his belief, not formed on slight grounds or short consideration, that this step would not be accomplished by crude and hasty attempts to plough, nor yet to dig—no, nor yet to "fork," by steam power. These were but the incidental means to the production of a certain result, and it was the result we wanted and not the means; these might be totally altered by the steam engine, which had already revolutionised the mere process, and simplified the attainment of the result in every mechanical task it had been applied to. What we wanted was a seed bed, a layer of soil cultivated to a certain depth, and cultivation consisted in the inversion, comminution, and aëration of the soil, no matter by what process. He believed, and all that the steam-engine had heretofore done warranted the belief, that when it came to this task, it would perform it in the most perfect detail, and by means more specifically peculiar to its own mode of action than any that could be thrust upon it by the attempt to gear on to it horse tools or hand tools unsuited to its nature, and not essential to the end in view. Let them look at what the steam-engine had done to navigation: it had there, as in other cases, substituted its own circular motion for the alternating and wasteful action of the oar. But while pointing out circular motion as the usual medium in steam machinery, he was far from sanctioning the converse error of applying it to horse-power. He threw out these remarks because he believed that before that time next year many experiments would be made towards the application of steam to cultivation, and he wished, if possible, to prevent a waste of labour and capital in erroneously-based attempts. Whenever that object was accomplished, be it in one year or after many, this country, with its mines of coal and iron, and its mine of industry to avail itself of them, could not fail to derive a new impulse and a new pre-eminence in agriculture, such as would make up for every disadvantage of soil or climate. The farmer of the clays, in our midland counties, no longer limited to the horse-work of 8 or 10 hours a day in difficult seasons, could employ an agent that would more than double the available opportunities; for the steam-engine could work almost throughout the 24, since darkness does not impede its operations. After some further allusion to the advantage derived by railroad accommodation, illustrated by the recovery of the dynamometer by Mr. Amos, its inventor, who had for a time lost it on his journey to Lincoln, Mr. Hoskyns concluded by proposing the toast of "The Railway Companies."

MEETING OF THE HIGHLAND SOCIETY AT BERWICK.—The visitors to Lincoln, especially if they approached it from the South, must have noted the magnificent promise of Wheat and other grain crops through which their journey led them. Those who have during the past week been at Berwick cannot have been less gratified, especially those of them who have passed through the eastern counties of Scotland, for more splendid green and grain crops were never seen at this season of the year. We have been told that it is the mark in Berwickshire of a good green crop year, when the leaves of the Turnips meet by the 5th of August: in most of the fields that we have seen, they have done so before the 1st, and in many the ground is already entirely hid.

Berwick is an admirable station for an agricultural gathering at this season, simply because of the admirable agricultural examples given in the neighbourhood from whatever quarter it is reached: and as regards the town itself, it is large enough to accommodate a very considerable accession to its numbers, and it offers in its immediate neighbourhood an admirable site for a show yard large enough to accommodate any quantity of stock.

The yard was opened on Wednesday after the trial of implements, and on the Thursday it was thronged by a multitude from all parts of the country, and especially from all parts of the county. As a whole, the show will be pronounced a successful one, whether by those interested in the prosperity of the Society or those who look upon the exhibition strictly as a means to agricultural improvement.

There was a great show of horses—a very good show of shorthorns, especially in the first class of bulls—a small number, of remarkable quality however, of the polled breeds, chiefly Angus—a fine show of Ayrshire cows—a large collection of Leicesters—some good pens of Southdowns—a full representation of the Cheviot breed—and as good an exhibition of implements as has ever been held at the Highland Society's annual meeting. Of course in this last department, and indeed in several others there is a very small and meagre exhibition, as compared with the one just held at Lincoln; but it must be remembered that the English Agricultural Society throw their whole strength into their annual show and Journal, while with the Highland Society its annual gathering is but one of very many objects which it keeps in view.

There are 225 implements exhibited. They are

arranged in some 60 or 70 sections, not according to the makers, but according to the nature of the implement itself. Thus, 22 ploughs for general purposes are exhibited side by side. It greatly facilitates comparison and selection; but for the commercial interests of an exhibitor, the English system, in which everyone has his implements together, is no doubt preferable. The prize is taken by Mr. Howard, of Bedford, for the implement with which he competed with Messrs. Ransome at Lincoln. Beside the short mould-boards and simple construction of the Scottish swing ploughs, it looked a very remarkable implement, and gathered great crowds continually, who were sufficiently astonished at a decision so entirely opposed to the opinions, hitherto, of Scottish ploughmen. The mould-boards of the English ploughs, exhibited at Lincoln, excluding the share, varied from 3 feet 3 to 4½ feet in length. The Scottish ploughs are very much shorter here. And that this length of mould-board and attachment of wheels, &c., does *not* increase the draught is proved by the fact that the decision in favour of Howard, by Scottish judges, was sanctioned by the dynamometer. We cannot enumerate all the classes under which the implements are arranged. Under the list of deep furrow ploughs, Howard's, which succeeded at Lincoln, is beaten by a large Scotch swing plough, by George Ponton, of Linlithgow.

Smith of Deanston's subsoil plough, as exhibited by Law of Shattlestorn, near Glasgow, was successful over some of the many tried implements, pronounced its superior by English judges.

The best double mould-board plough is that of Messrs. Sellar of Huntly, price 4*l.* 5*s.*, straight mould-boards and a guide-rod marking out the line of the next drill. Among other ploughs, Mr. Ponton, of Linlithgow, exhibits one having a revolving harrow attached to the tail of the mould-board, by which the furrow slice is torn and comminuted as it is turned. It receives a prize.

The grubber exhibited by him is also successful. A large show under this class of implement appeared. Among others, Tenant's grubber was exhibited—a very cheap and simple framework, with moveable tines; also Messrs. Wilson's (Berwick) improvements on it, consisting chiefly in the arrangement of the tines, the attachment of the handles, and the substitution of a double wheel for the single one in front.

A drill-grubber by W. Purvis, of Kelso, received a prize. Besides the ordinary grubbing tines, it had a revolving harrow with an independent motion derived from a central wheel, and its effect would be to throw the weeds, &c., loosened in its pathway, from it on to the surface in its wake.

Three Norwegian harrows were shown, Mr. Kirkwood, of Tranent, taking the prize.

Mr. Crosskill took the prize for a consolidating land-roller. Mr. Gibson, of Newcastle, for a pulverising roller—the one with his clod-crusher, the other with his double set of inter-working wheels, or discs, which has been already described in this journal.

Messrs. Sconlan, of Haddington, received a prize for a land-presser of the ordinary English make.

For harrows, Messrs. Howard take the prize with their jointed drags, and Mr. Thompson, of Berwick, with a set adapted for light land.

In swing trees, an exceedingly simple and ingenious substitute for the ordinary hook or S used in attaching them to the draft-chains, was shown by Mr. Gray, of Motherwell. It consisted in the terminal link of the traces being thinned or flattened on the side, by which *there* it passed into the close hook, from which it had no escape so long as it rested endwise in its place, as it would do when pulled.

Among the drilling machines was one by Mr. Sheriff, of Westbarns, Dunbar, to which there was attached an odometer and an index-plate, telling the acreage traversed by the machine and the quantity of bushels delivered by the sowing apparatus. This was capable of being put out of gear at the turnings, so that its indications were really trustworthy.

Turnip cutters on several principles are exhibited. Forshaw's of Liverpool, and Gardner's of Banbury, both received prizes.

Messrs. Finham are also successful in corn-bruisers. Messrs. Richmond, of Salford, in chaff-machines; Mr. Thompson, of Berwick, in steaming apparatus; Mr. Crosskill, in washing-machines for roots; Mr. Walker, of Coldstream, with a one-horse cart—a neat tilting cart of the ordinary Scotch build.

We may refer to an exceedingly neat scythe, capable of many exceedingly simple and easily effected adjustments, by Mr. Smith, of Auchterarder.

Mr. Dunlop, of Haddington, receives a prize for a very satisfactory method of effecting self-adjustment of the cart-saddle to any form of back. The pads are not a rigid part of the cart-saddle framework, but independent parts of it, having play to and fro within certain limits, by means of ball and socket joints, by which they are held by the rigid part of the framework. The latter thus rests on the animal through the intervention of the former, which by this independent motion adapt themselves with equal exactness to a narrow or a level back. A large number of implements are unclassified or designated as "collections," and "extra implements." Among them is a cheap and simple ribbing grubber, with drill machine attached, by George Aitken, of Edington, price 10*l*, doing five rows.

Mr. Bell, of Inchmichael, Errol, exhibits a drill with apparatus for sowing manure, by means of oscillating delivery, and ingenious rotating stirrers. Several reaping machines are in the yard, but they have not been subjected to a trial. A Turnip-cutter on the principle of Philip's, of Bristol, is provided with pulping as well as cutting revolving plates, exhibited by Mr. Sutherland, of Forse. We have not space for further notice of implements, and on the other departments of the show must postpone many of our remarks.

Cattle: *Short-horns.*—Class I., bulls calved before 1852. Mr. Booth, of Warlaby, takes the first prize with a white bull, 2 years and 10 months old, of remarkable fineness of touch and quality of flesh. The second prize goes to Mr. Shephard, of Tarves, for a bull bred by John Booth, of Killerby.

In young bulls, the first prize goes to Mr. Campbell, of Tullichewan, for a red bull, aged 2 years, very good in its fore quarters—not of remarkable quality of flesh. The second prize is taken by Mr. Clay of, Kelso; the third by Mr. Marshall, of Alnwick.

In bulls calved after January 1, 1853, Mr. Douglas, of Drem, succeeds with the animal he showed unsuccessfully at Lincoln—remarkably good in its hind quarters, somewhat coarse forwards. The second prize is awarded to a pretty little white beast shown by Mr. Milne, of Melrose. In calves Mr. Booth takes the first prize, and Mr. Willis, of Bedale, the second and third. In old Cows, Mr. Booth again takes the first prize with a remarkably straight, wide, well-built animal, of good quality. The second prize goes to Mr. Tod of Tranent, for a very fat and somewhat patchy beast, somewhat faulty behind the shoulder. The third is awarded to a red cow by Mr. Chrisp, of Alnwick. Among heifers calved after 1st Jan., 1852, the first prize is taken by the beautiful red heifer, successful at Lincoln also, shown by Mr. Douglas of Drem; the second goes to Mr. Saunders, of Penrith, and the third to Mr. Campbell, of Tullichewan. Among younger heifers, Mr. Booth takes the first prize with a white heifer, apparently somewhat weak and rickety behind. Mr. Douglas takes the second, and Mr. Haig, of Kirkaldy, the third.

The Polled breeds of cattle were represented by several large beasts in the bull classes, remarkable for their thick and fleshy covering where the meat is of the best quality, and also in some cases for the fineness of their handling and the quality of the meat. They are black, chiefly Angus, cattle. The prizes are taken by Sir J. Carnegie, of Brechin; Mr. Bowie, of Arbroath; Sir A. Burnett, of Banchory; and Mr. McCombie, of Tillyfour, who is especially successful in the cow classes.

The Ayrshire breed is represented by several in the class of bulls, and a large number in the cow classes. Extraordinary udders, some of them perfectly monstrous and evidently swollen out to an unnatural and cruel degree, characterise this breed, which is undoubtedly the dairy breed of the country. The prizes are taken by Mr. Murdock, of Cambuslay, Mr. Findley, of Ballusion, near Glasgow, Mr. Stewart, of Strathaven, &c. The Highland breeds are not well represented.

The annual dinner of the Society took place on the evening of Thursday, which was throughout fine and satisfactory to the very large number who, during it, crowded the show-yard and the city. We may have occasion for further remarks next week.

Mr. Mechi's Gathering.—The following are some of the remarks made by Mr. Mechi and Mr. Caird. The latter, in connection with the toast "Success to Agriculture," said—

"It was some years since he had the pleasure of visiting Mr. Mechi's farm, and he told him then, and he repeated it now, that he had entered on a path that would prove of great advantage. There were many points to which he might allude. But he thought, perhaps, the immediate trial, and the main question on which they were called to form an opinion was, that which was one of the points of the greatest interest of the day—the application of liquid manure. He thought they would all agree with him that it was in his corn crops that Mr. Mechi particularly excelled; and when a gentleman said he had made two blades of Grass to grow where only one grew before, he selected one of Mr. Mechi's weakest points, for in his Grasses he failed. What was the reason? It was this—in all the western parts of our island we found from the greater supply of moisture the land was peculiarly favourable to Grasses; and he had by the side of him Mr. Talfourd, from Ayr, who had followed the same course, and he found from him that he never had such success as this year in the growth of his Grasses, which he attributed to the wet season. Now in the west 10 inches more rain fell; under this there were 1000 tons of fluid on the field; and Mr. Mechi, before he could be on a level with them, must lay on 1000 tons an acre—he must do that before he could find himself on a level with the western agriculturists. Hence he knew the letter he read from Mr. Kennedy was strictly true when he said he could keep 90 sheep per acre, though it might be astonishing to their friends here. Therefore he thought he might say Mr. Mechi had attained great excellence in his corn, but had failed as to his Grass crops. To bring them to a clear understanding of the question, he brought them not a letter but a living man by the side of him, and he told them in the presence of all it was a fact that this man grew this year, by the aid of liquid manure, 25 tons of dry hay per acre. ["Impossible."] It was done on a Scotch acre per acre. [Expressions of disbelief.] in the neighbourhood of Ayr. It was not obtained at one but at three cuttings, and he took something like 100 tons weight of green Grass. This was a fact. They might wonder and be astonished, for it involved a question of from 5 to 50 sheep, and from 5 to 25 tons in hay, as compared to the soil in this country. This showed what was done. And it wanted but such examples as that of Mr. Mechi's to enlarge the production of food to an extent that was perfectly incalculable; and he thought the man who did that richly deserved the gratitude of his country. Mr. Mechi, in the course of his remarks made in the fields to day—and he never listened with more pleasure than he did to the lecture as they went along; and though some might think parts of it were not quite sound, it was clearly expressed—congratulated some of the neighbouring towns that they had taken up the question of sewage manure; but the only facts they had had, showed them that the advantages which had been gained by the application of liquid manure had been agricultural liquid manure, and they had no instance of sewage manure through pipes producing such extraordinary effects. [A voice—"Except at Edinburgh."] Except at Edinburgh. But it was a totally distinct thing in open sewers to putting it over the land with pipes; and those who were their chemists told them that for 1 lb. of valuable stuff they must apply 700 lbs. that was of no value whatever. As practical men they must keep this in view; and he did not know it was yet proved that the sewage of towns could be applied to farms in the same way as the liquid of the farm-yard could. [Hear.] He said that, that they might not be led into error till they had the thing fully proved.

Mr. Sandars gave as a toast "The health of the worthy President—a benefactor to his country and a friend to agriculture." (Drunk with loud cheering.)

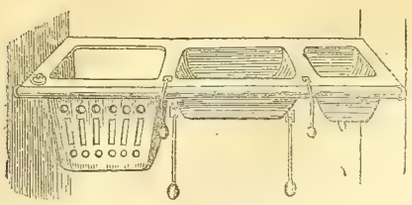
Mr. Mechi said he thought this really a case of wind and water. (Laughter.) He heard gentlemen on his right and left laugh, but he repeated in all sincerity and gravity that it was a case of wind and water; and when he told them that 75 per cent. of their bodies was water, that 20 per cent. was wind or gas, and 5 per cent. inorganic matter—or matter, he ought to say, that was soluble—he could only arrive at the conclusion that this was a very light meeting. (Laughter.) Science would tell them—they had had Davy, and now Liebig and others, who would tell them—that if they had not wind and water they would be blocks of wood; for if there was not a fluid, where would be their circulation? When they came to have an agricultural education, such an education as would fit them for their calling—and this must come—the company would not laugh at such a statement as this; for, as his friend Caird said, he was beaten in Grass because he had 1000 tons less water than they had in the western parts of this kingdom. That water was what?—it was everything; and when he cleaned out his boiler after some time working it, and took cart-loads of solid matter out of it, he at first wondered where it came from; but if it had not these things which entered into the circulation of the plant, that plant would soon want strength and life. Plants searched for and took up and fed on these things. As an instance of it, if they put a Vine within 10 feet of a river it would send a root out that would reach the water and take it up, thus showing that if the plant had not reason it had instinct. But we did not understand this as we ought to do; and when they looked into the schools of the country, and asked, "Where are your books on agriculture?" they said, "Oh, we don't know anything about that." He told them agriculture was not now what it would be 100 years hence. There were thousands of things in regard to it yet undeveloped, and our children would look back on their fathers and say, "What a stupid set of fellows they were—what a pity that science did not rise and enlighten their minds." (Cheers.) But he would not quarrel with the farmers as to whether they should turn up the stiff clay, he would not go into matters of detail; but he took the broad principle of education—and, he said, "You must teach these things to those who are to enter on the pursuit of agriculture—they must be pondered over, and studied, and understood, or you will not grow your quartern loaves as you ought to do." Let them look at the leading article of the *Times*, and see how it was that consols came to be at their present quotation. He said it was all a question of victuals. If they stopped the stomach, they stopped their commerce, their arts, their sciences, their manufactures; and as for their friend Dr. Lyon Playfair there, if he had no dinner for a fortnight, good bye to all his science. (Cheers and laughter.) He believed the time was coming when they should be awake and not insane, as they were now; the dinner which they ate to-day would reproduce itself to-morrow—that was, provided they did not send it down to the Thames to pollute the water instead of sending it to the land where it would fructify and reproduce itself again. (Hear.) Gentlemen had seen his children, and he would say that if those children fed on the milk of London, deprived of that nutritious quality which was lost by its being thrown away instead of being sent back to the pasture, they would find they would want bone and muscle, and development, for that was the cause why all the children of London had crooked knees and bow legs—(laughter)—because the excrement that ought by its use to make the milk rich, thus bringing up the bone and muscle, and development of the child, was thrown into the Thames. So long as they threw that into the Thames, and went to Peru and purchased guano at a high price to replace it, he did say they were not acting as business-like and sensible men, and as they would act when the matter came to be understood. (Hear.) He would not measure this meeting, this great and important and scientific meeting, by details, but he took the principle, and he said, "If God does not give you 10 inches of rain, you must go to a river, if you have one near you, and pour it on; you will thus double your stock, increase your corn, and thus you will increase the employment and the food of man." (Cheers.) He would not detain the meeting, as he might do on the subject—he would write it out some day; but he did say it was a question that bore upon the moral, the social, and political welfare of this great country. He held it as a great principle, that that which was not profitable to agriculture was not a thing that it was proper to advocate—if it was not desirable on the ground of profit it was worthless. Now, it would be said, "Where is the money to come from?" His reply was, he had now at that table the president of a body in London who would lend them the money for all these things if they could pay 6½ per cent. for it, to be repaid in 21 years; and he did say, if they did not borrow it they did not know their own interests. (Hear.) But he felt humbled when he saw those gentlemen from the city, and saw that they had companies in the first, second, and third floors for the improvement of the land in almost every country in the world—there was not a country they had not their money in, but they had not money in the improvement of English agriculture. He said it was a disgrace to them. Was there not ample scope in this country for that employment? When he travelled thousands of miles by railway through the country, what did he see? Poverty, and a fixed rent, fixed tithe, fixed labour, fixed everything and a limited production! It was like a gentleman having a large shop and nothing in it, and the rent of which was thus in effect doubled or trebled because he had not sufficient stock in it to make a profit. (Hear.) These things must be altered—the change must come, and therefore in these meetings he called together the people of the towns and the people of the country, for he felt it was only by such a combination that they would get more agricultural knowledge; for if they went into agriculture and did not understand it, it was of no use. He said, therefore, have your college in every county, so that those who were to practise agriculture should thoroughly know their business. Depend on it a man must learn his business by acquiring information, by study, and by practical experiment; and what he wanted to see was for the towns to introduce schools for agriculturists, and see that they really did understand agriculture before they turned them into the country to employ their capital in the pursuit. For himself he followed his destiny in the course he took, feeling that he could not allow agriculture, for want of exertion on his part, to remain as it was in this great kingdom. (Cheers.)

Notices to Correspondents.

Manures: *T C.* Woollen rags may be applied, notwithstanding their not being rotted. The Kentish farmers chop them into pieces, an inch or two across, and strew them evenly over the ground by hand. They give them no other preparation. The great value of the rags depends on their slow but gradual decay when in the soil.

Poultry: *Augusta.* Lay in a small stock of patience, try no more quack remedies, for, as in the present case, they in genera do more harm than good. Give your favourites no Beans or Peas, and but little Barley. Let their chief diet be Oatmeal and Wheat, and allow them a good Grass run. Should this treatment not answer, then mix a little Epsom salts with their food.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



THESE FITTINGS have all the newest improvements and are the only patented invention of this description. Also Improved Stable Fittings with Rack, Manger, and Water Trough attached, New Pattern Manger and Water Trough combined; Corner and Straight Mangers, Plain, Enamelled, and Galvanised; Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONFOUNDER, SMITH, &c., 370, Oxford Street, a few doors east of the Pantheon.

No. 32.
Garden Engine, with Warner's Registered Spreader and Wrench 31.; with iron pail, 3*l.* 12*s.*
No. 11.
No. 14.
Patent Conservatory Pump, with Warner's Registered Spreader, 24.; 18*s.*; with iron pail, 3*l.* 6*s.*

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

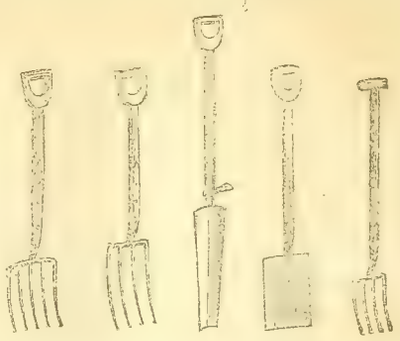
Sheets of Engravings sent on application.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the drought fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

Manufactured by Barnard & Bishop, Market Place, Norwich and delivered free of expense in London, Peterborough, Hull, or Newcastle.

IMPORTANT
TO
STOCK FARMERS,
AND
FLOCK MASTERS.

SHEEP, LAMBS, HORSES, AND CATTLE,
Can be Dressed with

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are non-poisonous, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as Arsenic or Mercury.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus promoting increased growth both of Mutton and Wool—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing no poison, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, Agents for Joseph Long,
Meriton's Wharf, and Shad Thames, London.

MR. MECHI, 4, Leadenhall-street, London, feeling that these are progressive times, has made EXTENSIVE ALTERATIONS in his BUSINESS ESTABLISHMENT, which, he trusts, will be for the comfort and advantage of his customers, by enabling them to inspect readily his general manufactures, consisting of articles of luxury and economy, suitable for presents or for use. Independently of his usual extensive stock of ladies' and gentlemen's Dressing Cases, Work Boxes, and Desks, in Wood, Morocco, and Russia Leather, he has devoted one entire apartment to the most choice productions in papier mâché ware, contrasting strangely with the once much-prized ware of Japan and China. Catalogues will be forwarded gratis on application. Mr. Mechi has prepared a very choice assortment of elegancies and utilities for sale at his depot, at the New Crystal Palace. His position is in the Nave, at the entrance to the French Court.

ENCAUSTIC TILE PAVEMENTS.

MAW and CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "the successful Imitation of Opy's Alexandrinum, in the beautiful Encaustic Tile Pavement of Cloisters of Byzantine Court," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

JACKSON'S PATENT PREPARATION for the PRESERVATION of POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.

It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. Jackson, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and Wotherspoon's machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of Wotherspoon, Mackay, & Co., 66, Queen Street, Cheapside, London; and Robert Wotherspoon & Co., Glasgow.

NOTICE.—Before leaving town, ladies and gentlemen should provide themselves with one of Berdoe's well-known VENTILATING WATERPROOF GARMENTS, which resist any amount of rain, without confining perspiration (the fatal objection to all other waterproofs), while their respectability adapts them for general use, equally as for rainy weather. An extensive variety for selection.—W. Berdoe, Tailor, 96, New Bond Street, and 69, Cornhill (only).

THE COMFORT of a FIXED WATER CLOSET for 1*l*.—Places in gardens converted into comfortable water closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l*. Indispensable for the health and comfort of a family. Hermetically sealed Inodorous Chamber Commodes, 1*l*. 4*s*., 2*l*. 6*s*., and 3*l*.; also, Improved Portable Water Closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE and Co.'s, removed to more commodious premises, at 46, Leicester Square, London.

METCALFE and CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at Metcalfe, Bingley, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

Caution.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s*. per box.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion Sold by all medicine vendors, price 1*s*. 1½*d*. per box.—Observe that "Thomas Prout" is on the Government stamp.

DR. DE JONGH'S
LIGHT BROWN COD-LIVER OIL,
Prepared for Medicinal use in the Loffoden Isles, Norway, and put to the test of chemical analysis, the most effectual remedy for Consumption, Bronchitis, Asthma, Gout, Chronic Rheumatism, and all Scrofulous Diseases.

Approved of and recommended by the most distinguished Scientific Chemists, prescribed by the most eminent Medical Men, and supplied to the leading Hospitals of Europe.

extracts from
MEDICAL AND SCIENTIFIC TESTIMONIALS:
THE LANCET, *July* 29, 1854.

"In the preference of the light brown over the pale oil we fully concur. We have carefully tested a specimen of the light brown Cod-liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. Ansar, Harford, & Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

"THE MEDICAL CIRCULAR." May 10, 1854.

"The pale oil, even when genuine, is deficient to a considerable extent, if not wholly, of the volatile fatty acid, iodine phosphate of chalk, the cholinic acid, bilifellinic acid, and other elements of bile, which are found in their normal proportions in the light brown oil. The utmost reliance may be placed upon the experimental researches of Dr. de Jongh, who is one of the most eminent of European chemists; the oil prepared by him enjoys also the additional sanction of the opinion of Baron Liebig and the late Dr. Pereira, in favour of its genuineness and efficacy. Our own experience practically confirms their judgment, and we unhesitatingly recommend the light brown oil as the best for medicinal purposes, and well deserving the confidence of the profession."

BARON LIEBIG.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this medicine, in its purest and most genuine state, must ensure you the gratitude of every one who stands in need of its use."

DR. JONATHAN PEREIRA.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, and CO., 77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and the British Possessions; at the following prices:—

Imperial Measure, half pints, 2*s*. 6*d*.; pints, 4*s*. 9*d*.

*** Four half-pint bottles forwarded, carriage paid, to any part of England, on receipt of a remittance of Ten Shillings.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. Douglass, 18, Holland Street, Brixton, London.

SOUND and WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as highly conducive to health and longevity. Among the various preparations offered for the purpose, ROWLAND'S ODONTO, or PEARL DENTRIFICE, stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, it will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, and thus fix the teeth firmly in their sockets; and from its aromatic influence imparts sweetness and purity to the breath.—Price 2*s*. 9*d*. per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. Rowland & Sons, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by chemists and perfumers.

IT is the peculiar characteristic of PARR'S LIFE PILLS that they purify the system mildly and imperceptibly, so that there is no reaction or tendency to constipation afterwards, as is the case with the purgatives administered by many apothecaries and ignorant pretenders. There are instances of persons with diseased livers and tender lungs who have passed years of misery, pain, and apprehension, but who, after taking Parr's Life Pills, have actually been made whole, the liver having resumed its proper functions. For bilious disorders, liver complaints, indigestion, loss of appetite, costiveness, sick headache, and depression of spirits, there is no remedy equal to Parr's Life Pills. Invalids should make an immediate trial of this excellent, long-tried, and successful medicine. Ask for Parr's Life Pills.—Sold in boxes, at 1*s*. 1½*d*., 2*s*. 9*d*., and family packets at 11*s*. each, by all respectable chemists, booksellers, and medicine vendors throughout the world. Full directions are given with each box.

Wholesale and Retail Agents:—E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, Farringdon Street; Sutton & Co., Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London.

SOUTHDOWN RAMS.

MR. R. H. ELLMAN informs his Friends that his RAMS are now ready for Letting or Sale. The Rams may be seen and terms known at any time.—Landport, Lewes.

TO NURSERYMEN, FLORISTS, OR GARDENERS.

TO BE SOLD, for 300*l*., a FREEHOLD, consisting of Two acres of well-drained, highly-cultivated LAND, having on it a Cottage residence of considerable size, situate half-way between Brighton and London, and 1½ mile from a Railway Station. It is well watered, commands extensive views, and is exceedingly healthful.—Apply by letter to W. W. R., Little Windmill Street, Brewer Street, Golden Square, London.

TO BE SOLD, a bargain, a well-stocked small NURSERY, containing several Greenhouses and Pits; the ground is well stocked with roots and fruit trees.—Apply to Mr. G. Smith, Bell Inn, Edmonton.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill Illustrated Catalogues forwarded post free.

SPANISH AND DORKING CHICKENS FOR 1854, bred from the Prize Birds at Bath, Cheltenham and Lincoln, and other first-rate Stock. As also some Brahma Pootra Chickens and White Aylesbury Ducks are now onSale, and may be had by amateurs and others wishing to improve their stock of Poultry.—Apply, by letter only, post-paid, to Mr. H. D. Davies, Spring Grove House, Hounslow.

MR. H. D. DAVIES has much pleasure in allowing any one to see his Stock of POULTRY; but some inconvenience having arisen from the visits of persons altogether unknown, and at unseasonable hours, those ladies and gentlemen who may wish to see the birds, are requested to favour Mr. Davies previously with their name and address, when a card of admission will be immediately forwarded. In future, no person can be admitted into the poultry yard without producing such a card, or at any other hours than those named for the purpose.
Spring Grove House, Hounslow.

Sales by Auction.

PIGS, ETC.—SALE OF VALUABLE BREEDING STOCK.

MR. J. C. STEVENS is directed by a well-known Amateur to announce for Sale by Auction, at the Great Central Horse Repository, St. George's Road, Southwark, on WEDNESDAY, August 9, at 3 o'clock in the afternoon precisely, BOARS and SOWS, and BOAR and SOW PIGS, from the counties of Lincoln, Berks, and Dorset, designed for the purpose of breeding, including fine specimens of the improved sorts of both large and small breeds, selected from stocks of celebrity in the various localities; also a DOG and BITCH, of the pure Mount St. Bernard's Breed, admirably matched, and considered to be the finest in this country, and a NEWFOUNDLAND DOG.—May be viewed on morning of sale, and Catalogues had at the Repository (opposite the Elephant and Castle); and of Mr. J. C. Stevens, 38, King Street, Covent Garden, London.

NURSERIES, CLAPHAM.

MESSRS. PROTHEROE & MORRIS are instructed by the Administrators of the late Jos. Fairbairn, to offer for unreserved sale, in the early part of September, the entire stock of specimen Greenhouse and Stove Plants, which are all of the most choice sorts, and in the best condition. The lease of the old established Seed Shop and Nursery to be sold; the Stock may be taken by valuation or by agreement: for particulars apply to the administrators, at the Nursery, Clapham, or to James Fairbairn.—Robert Silvester Brown, and Clack, Administrators, Nursery, Clapham.

SUPERIOR DOWN COTSWOLD RAMS.

MESSRS. T. MALLAM and SON have received instructions from Messrs. Druce, of Eynsham, near Oxford, to Sell by Auction, on WEDNESDAY, the 9th day of August, at 11 o'clock, in a Close near Worcester College (being the Monthly Cattle Market at Oxford), about 30 SUPERIOR SHEARLINGS, a few older sheep, and two well bred Yearling Bulls. The Auctioneers beg to observe that this Stock gained the first prize at Smithfield, in 1853, and has been successfully exhibited at the Birmingham and Midland Counties, and the Oxfordshire Shows for some years past.

Now ready, Part I., of

THE FERNS OF GREAT BRITAIN, Illustrated by JOHN E. SOWERBY; Descriptions by C. JOHNSON, Esq. To contain about 46 Plates, and to be completed in Eight Monthly Parts, full coloured, at 3s.; partly coloured at 1s. 6d. per Part.

To be had through all Booksellers; and of the Proprietor, JOHN E. SOWERBY, 3, Mead Place, Lambeth.

JOHNSON AND SHAW'S FARMER'S ALMANAC FOR 1855.—Alterations and Corrections for the above should be forwarded to the Publisher as early as possible.

London: JAMES RIDGWAY, 169, Piccadilly.

On Monday, the 7th of August, will be published, carefully revised and wholly reprinted, in One Volume, price 5s.,

HARD TIMES.

BY CHARLES DICKENS.

BRADBURY AND EVANS, 11, BOUVERIE STREET.

On the 16th of August will be published, price 5s. 6d.,

THE NINTH VOLUME OF

HOUSEHOLD WORDS.

Conducted by CHARLES DICKENS.

CONTAINING "HARD TIMES" COMPLETE.

OFFICE, 16, WELLINGTON STREET NORTH, STRAND; and Sold by all Booksellers and Newsvenders.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening Pursuits, are invited to examine DEANE, DRAY, AND CO.'s extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also wholesale and retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY AND CO. (Opening to the Monument) London Bridge. ESTABLISHED A.D. 1700.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 37, Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, August 5, 1854.

A GRAND EXHIBITION OF HOLLYHOCKS, Open to the United Kingdom, will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on TUESDAY, August 22. A Subscription is now open for the purpose of raising a fund of sufficient magnitude to distribute Prizes to Nurserymen and Amateur Growers worthy the merits of this noble and popular flower. It is intended to offer a Silver Cup, value 5*l.* 5*s.*, to each class for spikes in flower, with valuable descending Prizes of Gold and Silver Medals. Cut Blooms also will receive their due share of attention. In addition to the above, Gold and Silver Medals will be awarded for Miscellaneous Collections of Stove and Greenhouse Plants, Specimen Plants, Dahlias, Roses, &c.

COMMITTEE.—Messrs. W. Barnes, Peckham; J. W. Bircham, Bungay; W. Bragg, Slough; W. Chater, Saffron Walden; W. Paul, Cheshunt; A. Parsons, Ponder's End; Roake, Clewer; and C. Turner, Slough, by whom subscriptions will be received, also by the Secretary. Lists of Prizes, with Rules of the Exhibition, may be obtained of the Secretary, J. T. NEVILLE, Ebenezer House, Peckham.

CHICHESTER HORTICULTURAL SOCIETY.—The Autumn Exhibition will be held on THURSDAY, August 31, when, in addition to the usual Premiums, Prizes of 3*l.*, 2*l.*, and 1*l.*, Open to all England, are offered for Hollyhocks, 12 varieties, in spikes. Entrance, 1*os.*

HENRY SILVERLOCK, Jun., Secretary.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY.—The annual Autumn Exhibition, to be held at the ROYAL PAVILION, Brighton, on WEDNESDAY and THURSDAY, Sept. 13 and 14.

President.

HIS GRACE THE DUKE OF DEVONSHIRE.

Vice-Presidents.

GERANIUM, very choice, 1*s.*; extra new and choice	2 6
" from finest fancy varieties	1 6
GLOXINIA, fine, 6*d.* extra from new and choice ...	2 6
ANTIRRHINUM, choice, 6*d.* extra from superb flowers	1 0

A List of Choice Seeds selected for Autumn sowing may be had free by post on application.

Post-office orders to be made payable to BASS & BROWN, or STEPHEN BROWN. Penny stamps received for small amounts.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CUTHILL'S EARLY BLACK PRINCE and LATE PRINCE OF WALES STRAWBERRIES.—Very strong rooted plants will be ready August 28; the Black Prince 5*s.* per 100, the Prince of Wales 10*s.* per 100. The two sorts lasted in successive bearing this year for 75 days, in the open ground here. The Prince of Wales is a handsome and good flavoured dessert fruit, and the best late preserver; hundreds of ladies round here have proved it for these last three years.

J. C.'s Pamphlet on the Potato Culture, containing the best and only way of growing early and large crops, and avoiding the disease. It also contains 20 more articles upon the Strawberry, Rhubarb Wine, &c. Price 2*s.*, or by post 2*s.* 4*d.* Post-office orders on Camberwell Green,—JAMES CUTHILL, Camberwell.

PRIME DRUMHEAD PLANTS.

THOMAS WELLAND, Surrey Gardens, Godalming, offers the above plants at 3*s.* per 1000, or 8000 for 1*l.*, packed and delivered at Godalming Station.

CALCEOLARIA SEED.

MR. HENRY MAJOR, Knowsthorpe, near Leeds, begs to announce that his new CALCEOLARIA SEED of this season is now matured, and may be had in packets at 2*s.* 6*d.* each, or 3 packets for 5*s.*, post free. The Seed has been produced from rich and beautiful varieties, for which his collection stands unrivalled, and therefore Seedlings possessing good and beautiful properties may reasonably be expected. The present, up to the end of this month, is a proper time to sow for insuring an early spring bloom. Postage stamps are respectfully requested in payment of the Seeds.

CHOICE SEEDS.—Splendid mixed Sweet William, Antirrhinum, Primula sinensis fimbriata, Calceolaria, and Cineraria, Chater's Hollyhock, 1*s.* and 2*s.* 6*d.* per packet. Can be strongly recommended; saved only from the best flowers. Catalogues free by post.

DAWE, COTTRELL, & BENHAM (successors to F. Warner), Seedsmen, 36, Moorgate Street, and 3, Laurence Pountney Lane, City London.

Agents for Butcher's Barbarossa Vines, M'Adam's Anti-Grape Blight Composition, and Cole's Concentrated Animal Manure.

WILLIAM IVERY begs to inform his friends and the public that he is now prepared to send out his New GERANIUM FAVOURITE, the most beautiful variegated variety yet out. A great improvement on Attraction. Truss large, brilliant scarlet, free grower; splendid for bedding purposes. Price 7*s.* 6*d.*

GERANIUM MASTERPIECE (Ivery's). A beautiful scarlet of immense truss; foliage truly beautiful, the habit-shoe far surpassing Cerese Unique in variety of colours. Price 5*s.*

CINERARIA, MRS. TRUELOVE, figured in Turner's "Florist," May 1854; this variety has gained certificates at the National and other Societies: colour white ground tipped with rich plum, fine shape and splendid habit, 7*s.* 6*d.*

W. I. has now ready strong flowering plants of all the leading Liliputian and large flowering Chrysanthemums, from 9*s.* to 12*s.* per dozen. Autumn Catalogues can now be had on application, which contain a select list of Geraniums, Fuchsias, Cinerarias, Azaleas, Winter Blooming Carnations, Antirrhinums, Phloxes, Chrysanthemums, hardy Herbaceous Plants, Dwarf Roses in pots, Miscellaneous Plants, &c. N.B. The trade supplied with fine Mushroom Spawn.—Hanover Nursery, Peckham, London.

PATTERSON'S SCARLET NONPAREIL STRAWBERRY

JAMES VEITCH, Jun., begs to inform the Public that he is now prepared to send out good well rooted Plants of the above-named fine Strawberry, which was exhibited at Chiswick, on Saturday, June 3d, and received the Silver Knightian Medal. It was also submitted to Dr. Lindley, Mr. Marnock, and Mr. Thompson, all of whom reported most favourably of its merits. The terms are—for 100 plants, 3*l* ; 50 ditto, 2*l.*; 12 ditto, 12*s.* The stock is limited, and orders will be executed strictly in the rotation in which they are received.

Exotic Nursery, Chelsea, Aug. 12, 1854.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy. RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.

Eggliscliffe, near Yarm, August 12.

THOMAS BEACH, the well-known Strawberry Grower, begs to inform the public that he has now ready a large stock of fine strong Plants of his true British Queen, the same he beat the whole world with at the Crystal Palace, many of them weighing from two to three oz. each, likewise the same he gained the Knightian Medals at Chiswick, and many other places; that he has gained the head prize, and surprised the world, both in flavour and weight. Fine strong Plants sent to any part of the world at 5*s.* per 100, box included. Post-office Orders on Hounslow, to Mr. THOS. BEACH, Strawberry Grounds Worton, Isleworth, Middlesex.—August 12.

THE BEST PLANT OF THE SEASON.

"BEGONIA PRESTONIENSIS SUPERBA."

W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr Frost, Gardener to E. L. Betts, Esq., Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with stamens and petals, resembling a double blossom with a golden tinge, exhibiting a charming contrast The flowers are delightfully fragrant as a Tea-scented Rose. Habit—dwarf and bushy; the flowers are thrown well above the foliage, in large trusses, and altogether one of the best plants yet offered. It received the highest award in June, at the Royal Botanic Show, Regent's Park, as a new plant; also at Maidstone and Ashford. Plants in October, 10*s.* 6*d.* each; one given where three or more are taken.—Bower Nurseries, Maidstone, Aug. 12

ORANGE AND SHADDOCK TREES.

TO BE SOLD, a bargain, within five miles of the Reading Station of the Great Western and eight miles of the Winchfield station of the South-Western Railways, some fine large specimens of the above.—Apply to JOHN SUTTON and SONS, Reading, Berks.

SEED POTATOES.

TO BE SOLD, from 10 to 12 acres of PRINCE REGENTS, and 6 or 7 acres (imperial) of ORKNEY REDS. The above are perfectly free from all taint or disease, in fine condition for seed, and being grown on Mossy land, and chiefly without farm manure, will be valuable as seed. They will be lifted and carted to the nearest station on the Caledonian Railway free of expense. Carriage from thence to be paid by the purchaser.—Apply, stating offers per ton, to Mr. JAMES CLARK, Marchbank Wood, Moffat. N.B. Samples will be forwarded if desired.—August 12.

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Journal of Botany," by his Uncle, THOMAS NUTTAL, ESQ., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched in October. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, August 12.

SPLENDID

CALCEOLARIA, CINERARIA, & SWEET WILLIAM SEED.

WILLIAM BARNES respectfully begs to inform his friends and the public generally, that he has now ready to send out in packets, at 2*s.* 6*d.* each, seed of his unrivalled Herbaceous Calceolarias, which has given so much satisfaction for two years; the varieties have been selected with the greatest care, and none but the finest colours and best shaped flowers have been retained and carefully hybridised.

W. B. has for two years paid great attention to the improvement of the SHRUBBY BEDDING CALCEOLARIA, having purchased all the best kinds from the most eminent growers, and selected from them while in bloom the best shapes, finest colours, and most perfect shrubs; by careful hybridising he has succeeded in raising some first-rate varieties, and is now enabled to offer a few packets of fine new seed at 5*s.* per packet; this W. B. feels assured will give as much satisfaction as his herbaceous varieties have done before, which numerous letters he has received from various parts of the United Kingdom will testify.

CINERARIA SEED, saved from none but the very best and newest varieties in cultivation, at 2*s.* 6*d.* per packet.

The SWEET WILLIAMS have been grown in his Nursery Grounds for two successive years, and have caused universal admiration from all those who have seen them in bloom; nothing can be more beautiful for either clumps or borders, and they retain their great beauty for a very long time. Packets of fine seed at 1*s.* 6*d.* each. A remittance is expected from unknown correspondents.—Camden Nursery, Camberwell, London.

WILLIAM BARNES begs to call the attention of his friends and the public generally to his general stock, which will be found to contain the greater part of the very best things in cultivation.

CHINESE AZALEAS, all the best varieties that have been sent out up to the present time, great care having been taken in the growth of this beautiful family of plants, all the weak delicate growing varieties being selected and worked upon strong healthy stocks, and the plants are such as are rarely to be met with for health and vigour, and will bloom fine next season.

GERANIUMS, all the best fancies, large flowering kinds, and bedding, as well as the following variegated varieties, viz., Flower of the Day, Mountain of Light, Golden Chain, Silver Queen, Silver King, Attraction, Lady Cottenham, Brilliant, and Cupped Leaf.

Also the finest varieties of Delphiniums, French and Belgian Phloxes—many of them may now be seen in bloom.

Perpetual Blooming Carnations, fine plants that will bloom through autumn and winter in great variety.

All the new French and English Verbenas, fine strong plants.

Chrysanthemums, Pompons, and large flowering varieties; newest and best fine strong bushy plants.

Roses on own roots, comprising the newest and most approved kinds of Hybrid Perpetuals, Bourbons, Teas, Chinas, Noisettes, Hybrid Chinas, and Hybrid Bourbons. These have all been kept shifted into larger pots, and are now very fine strong healthy plants. Japan and other Liliums, of which W. B. has a very large stock, both in beds and pots.

A very fine selection of all the most approved kinds of Vines from eyes in pots, among them some extra strong plants of Black Barbarossa.

Antirrhinums, Pentstemons, Petunias, Heliotropiums, Lobelias, Fuchsias, and fine plants of Hydrangea japonica variegata.

Fine new Mushroom Spawn.

An inspection of his Stock is respectfully solicited.

N.B.—Catalogues can be had on application.

Camden Nursery, Camberwell, London, Aug. 12.

WARD'S "OMER PACHA" STRAWBERRY.

W. J. WARD (by permission of his employer, W. Stephens, Esq.,) offers to his friends and the public the above Seedling Strawberry, which has been proved to possess superior excellence. It is a large handsome fruit, intermediate between the old Carolina Pine and British Queen, partaking of the fine colour of the former, and by many considered superior in flavour to the latter; it is also remarkable for the fine buttery quality of its flesh. Great bearer; ripe as early as Keens' Seedling, affording a long succession of fine fruit. It was exhibited at the Royal Botanic Gardens, Regent's Park, on Wednesday, the 5th of July, and obtained the Bronze Medal. It has also been submitted to Mr. Marnock, Regent's Park, London; Mr. Thompson, Horticultural Society, Chiswick; and Mr. Spencer, Bowood, all of whom speak highly favourably of it. Also the following, who have pronounced it first-rate, and are open to take orders for it:—Messrs. Henderson, Pine-apple Place, London; Mr. C. Turner, Royal Nursery, Slough; Messrs. Standish and Noble, Bagshot; Mr. P. Lydiard, Fruiterer, Bathcaston, Bath; Mr. W. J. Epps, Bower Nursery, Maidstone; Messrs. Sutton, Reading; Mr. W. Barnes, Camberwell; Mr. Lewis Solomon, Fruiterer, Covent Garden.

Strong well rooted plants last week in August. Terms, cash or reference.—100 plants, 3*l.*; 50 plants, 1*l.* 15*s.*; 25 ditto, 1*l.* A few strong plants in 32-sized pots, 15*s.* per dozen.

Prospect Hill, Reading, August 12.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.

Contracts given for Heating.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS. and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

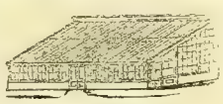
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

HORTICULTURE IN ALL ITS BRANCHES.

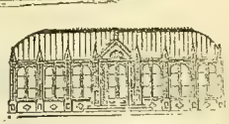
J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



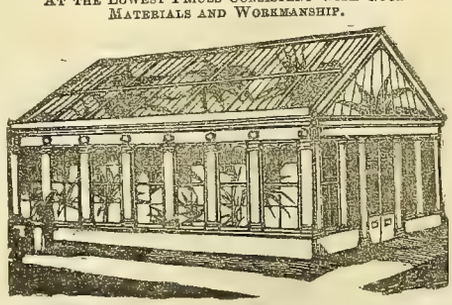
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

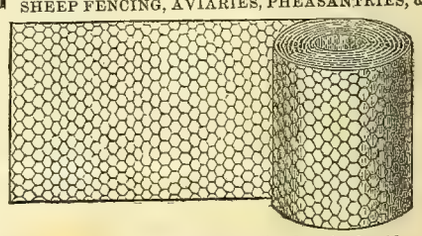
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.



Two-inch mesh, light ... 6*d.* per lineal yard 2 ft. wide.
" " strong ... 8*d.* " "
" " extra strong 1*s.* " "

Any size or quantity made to order on the shortest notice. Special Estimates given for large quantities.

All kinds of Ornamental Wire Work made to any design.

GEORGE CASTON AND CO., Wholesale Wire Netting Manufacturers, Howard's Buildings, Brick Lane, St. Luke's, London.

Orders by post punctually attended to.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.

This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.

GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised.
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard
30 in. " 2 in. "	9*d.* "	6½*d.* "
36 in. " 2 in. "	10½*d.* "	7½*d.* "
48 in. " 2 in. "	1*s.* 2*d.* "	10*d.* "

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

BECK'S NEW SEEDLING PELARGONIUMS.

AUTUMN, 1854, AND SPRING, 1855.

J. DOBSON & SON, Woodlands Nursery, Isleworth, beg to offer, with the greatest confidence, the following Eight new and beautiful Pelargoniums, the entire stock being in their possession. They have been successfully exhibited throughout the season, and cannot fail to give the greatest satisfaction. Strong healthy plants usually sent out from this Nursery will be ready by the first week in October. The usual allowance to the trade.

CONQUEROR.—A fine smooth constant flower, of first-rate quality, lower petals crimson scarlet, with rich maroon spot on the upper petals, leaving a narrow distinct margin of crimson scarlet, good shape, free bloomer, and excellent habit, quite distinct from anything yet offered, and will prove a first-rate flower for all purposes. 42*s*. It was exhibited at the National Floricultural Society's Meeting the 15th of June, and was awarded a First-class Certificate. A flower was also submitted to J. Riley, Esq.; the following was received as his opinion, when writing to Mr. Beck:—"Dear Sir,—The blooms of your seedling Geranium, 'Conqueror,' arrived in good perfection; it is a lovely, dark-coloured variety, will require no artificial dressing, a great recommendation, and cannot fail to please any purchaser.

"Bickley, 17th June, 1854. "Yours truly, J. RILEY."

FIDELIA.—Large flower, lower petals deep rosy purple with clean white centre, upper petals purplish maroon with narrow margin of rosy purple, good shape, free bloomer, and good habit; a desirable variety for exhibition, being distinct in colour, and coming good throughout the season. 31*s*. 6*d*.

SILENUS.—Rich orange scarlet lower petals, with brownish crimson spot on the upper petals, leaving a narrow even margin of orange scarlet, lower petals clouded with brownish crimson, a very striking variety, good shape, free bloomer, and strong habit. It was awarded a Certificate of Merit at the National Floricultural Society Meeting, 15th of June. 31*s*. 6*d*.

LAURA.—A very distinct lively purplish rose, with clear white throat, with small dark spot on the upper petals, a very pleasing flower, good shape, and free bloomer, a great improvement on Rosamond, will prove a first-rate variety for exhibition; received a Certificate of Merit at the June Exhibition of the Royal Botanic Society. 31*s*. 6*d*.

DIDO.—A large flat setting flower, lower petals rosy orange, with a distinct white eye, upper petals dark maroon, leaving a narrow margin of rosy orange, good habit, and free bloomer, a distinct and striking variety. 21*s*.

LYDIA.—Upper petals brownish maroon, with narrow margin of rose, lower petals pale lilac, good shape, and free bloomer. 21*s*.

GEM OF THE WEST (FULLER).—This is unquestionably the best white variety yet raised, fine silvery white, with pure claret spot in the upper petals, good form, excellent habit, and very free bloomer. This variety will be found a very great acquisition for exhibition purposes. It has been successfully exhibited throughout the season. It received a Certificate of Merit at the National, May 4th, also at Hampton Wick, June 29th. 31*s*. 6*d*.

COMMANDER-IN-CHIEF (DOBSON).—This variety will be found very desirable on account of its blooming very late in the season, the flowers not having their true colours till July, in the style of Magnificent, but being a better shape, and the flowers much stiffer, it is an improvement on that variety. 21*s*.

The following were sent out last autumn, and have given very great satisfaction.—Empress, 15*s*., Leah, 10*s*. 6*d*., Neatness, 10*s*. 6*d*., Pictum 7*s*. 6*d*., Rebecca, 10*s*. 6*d*., Marginatum, 7*s*. 6*d*., Eliza, 7*s*. 6*d*. All the best of other raisers, 7*s*. 6*d*. and 10*s*. 6*d*. each, good strong plants. All the best Pansies in cultivation, from 9*s*. per dozen. Cinerarias, 9*s*. per dozen. Fuchsia, Duke of Wellington (Stokes), good plants in bloom, 3*s*. 6*d*. each.

Calceolaria Seed, very choice, 2*s*. 6*d*. per packet; Pansy, 1*s*.; Cineraria, 1*s*.; Antirrhinum, 6*d*.; Mimulus, 1*s*. A Catalogue of Dutch Bulbs will be ready in September.

All the New Flowers of the season at Catalogue Prices.

MAY'S PARAGON CABBAGE.—Prepaid postage. The above superb CABBAGE can still be had in 1 oz. packets, 1*s*. each. Sow July and August.

Also new CINERARIA SEED from the best named flowers, in packets, 2*s*. 6*d*. each.

Address, HENRY MAY, the Hope Nurseries, near Bedale, Yorks.

The Gardeners' Chronicle.

SATURDAY, AUGUST 12, 1854.

MANY years ago a philosopher was observed dividing a small heap of SAWDUST into two equal parts, and diligently WASHING one part in water. "Why wash sawdust?" said his neighbours; "why does he want it to be so very clean? He is not half so particular about his linen." We fear the imputation was true, for it must be owned that his linen much resembled the colour called Isabelline. But, then, the philosopher's linen was not a subject of experiment. In due time the washing ceased, and the clean sawdust was dried in the sun, by the side of the portion which was left unwashed. Each was then placed in a coarse unglazed earthen pan, and conveyed to a damp underground vault. There it remained, and the mystery was forgotten.

One day the experimentalist invited his friends to a little breakfast. When the guests assembled, it was remarked that two covered dishes were placed opposite himself. "My friends," said the host, "I have been lately occupied in some inquiries into the nature of food, and I am happy to say I have succeeded in making a discovery which concerns you all. I have found out what it is that devours your floors, and your beams, and all the forms which wood assumes when converted to rural purposes. There is not much to boast of in that, for many know already that plants of the Mushroom and Toadstool races accompany the decay of timber some even suspect that they cause it. But why they accompany it, or how they cause it, is an undetermined question. That is what I have settled. I have found out the food of such fungi, and before we commence our own repast I shall have the honour to show you them at their meal." Saying this, the host raised the covers of the two dishes before him. In one was a heap of a nice clean substance, which looked as if it were a preparation of bread crumbs; the other exhibited a foul mass overrun with little Toadstools, fungus-spawn, and mouldiness.

"There! gentlemen," resumed the philosopher, triumphantly, "you see your enemies at work, and you can now judge how to guard yourselves against them." The guests were puzzled; they saw no more than we have described. "You are surprised, my friends, and naturally. It is not given to all to view the operations of nature with the eyes of intelligence. Permit me to explain. A few months ago these two heaps were alike; both were sawdust, collected from that old *Saule-marceau* which, you remember, stood opposite the gate. Nothing, you know, is devoured by decay so soon as the *Saule-marceau*. Why is it devoured so soon? That was what I wanted to know. One day, while looking at a rotten stump, it occurred to me that if the Sallow is preyed upon with such avidity, it must be because it contains food of some sort suited to the nature of the bodies that consume it. Those bodies, which we call funguses, are plants. Now, plants will only feed upon what may be dissolved in water. If so, it seemed to me that if the wood was deprived of what will dissolve in water, there would be no food for the funguses to live on, then it would be necessarily deserted by them, and thus would escape decay. How to work out the idea? It is difficult to wash wood without contrivances which I do not possess, and the whole question turned upon the washing being complete. Why is the washing so difficult? because there is no introducing water into the pores of wood. But it would evidently be useless to wash only the surface of wood, because all the race of funguses sends its spawn deep into the substance. It would, however, be easy to introduce water into wood broken into small pieces—that is to say, in the state of sawdust—and the result obtained would be just as satisfactory as if the wood were solid. On this, my friends, I founded the experiment whose issue is now before you.

"Two heaps of sawdust, each exactly alike, were gathered from where the *Saule marceau* had been converted into laths. One heap was washed over and over again, till everything capable of dissolving was removed, the other heap was undisturbed. Both, having been dried, were afterwards placed in one of the dampest and closest vaults of our old neighbour the Chateau Mesnil. Here they remained till yesterday. Behold the result! The wood that was washed till nothing more could be carried off by water is still the clear bright mass it was at first; the other, unwashed, has become the prey of the foul parasites that are now at their repast, and have been so for many weeks. Observe how rank they have grown—how gorged with juice, how eager their attack! And see, too, how their victim has already crumbled and decayed within their deadly grasp! Can anything be plainer than that the funguses have found agreeable nutriment in the unwashed heap, and that the other is to them as destitute of food as the sands of the desert to the hungry Bedouin. Wash your timber then, my friends, wash it thoroughly; water purifies it from the seeds of corruption; force clean water through its pores; spare no pains to do this thoroughly, and your floors, your beams, your buildings will be exempt from all decay, except such as age is inevitably heir to. And now to our own breakfast."

It must be owned that the philosopher's guests were rather mystified by this harangue. They looked at the heaps of sawdust, they were eye-witnesses of the exactness of their host's account of them; they saw nothing but corruption in the one, and all the signs of incorruptibility in the other; and some among them, not before much given to ablution, resolved forthwith to try more zealously the purifying influence of water upon themselves. But they did not understand the advantage of rendering wood incorruptible, if it were to be first converted into dust; some thought, indeed, that it might be as well to leave funguses to do their work in course of time, as to anticipate time with the assistance of a sawyer. In short, their friend was much too clever for sublunary affairs.

Have the philosopher's views even yet been fully appreciated? We fear not. Has water been forced by exhaustion through the pores of timber till nothing is left to dissolve? Has the wood then been dried before being finally applied to building purposes? We think something of the kind was mentioned in connection with BOUCHERIE'S experiments; but a lecture by Mr. BURNELL, reported in the last number of the "Mechanics' Magazine," leads us to doubt whether any serious English trials have been made. Our object seems to have been to force *into* wood matters which it is supposed will prevent decay; not to force *out* of wood the soluble azotised matters which so greatly cause decay. Could wood be purified from them, timber would be as imperishable from natural causes as starch itself; and every gardener knows how long the starch in his Potatoes struggles against the decomposing forces which so soon destroy all other parts.

This is a great question, and all the greater because, if answered in the affirmative, the preservation of timber will be effected by the cheapest of all substances.

Now that the progressive transformations which cause the production of the corn WHEAT from the grass ÆGILOPS have become familiar to the well-informed cultivator, everything which throws light upon the tendencies among cereals to change their accustomed condition acquires interest. For that reason we produce in the accompanying woodcut a representation of a monstrous Wheat, remarked last year by Professor HENSLOW in one of his village allotments. It will be seen that at each of the places marked *a a a* there is an additional body, having a very distinct reflexed position; and that at *b* a similar though different appearance occurs. Upon examining the structures carefully, we find that at *a a a* there is, in addition to the usual spikelet, a lateral one, consisting of imperfect chaffs (*glumes* and *paleæ*) containing from two to three florets. This additional spikelet occupies the same position as one of the regular lateral one-flowered spikelets of Barley. At *b* there is an additional chaff or glume, reflexed as before, but imperfect, and merely indicating a tendency in other parts of the ear to assume the peculiar condition of *a a a*.

We entertain little doubt that, in this example, we have before us the elements of that greater change which ultimately resulted in the production of Egyptian Wheat out of the common Revett or *Triticum durum*; and if this be so, we have evidence that the common red or white Wheats may also be expected to branch in the ear, and thus acquire a degree of productiveness at present unknown among them.

Now that all eyes are upon Wheat fields, we, as botanists, would direct attention to this fact, and suggest the propriety of putting aside any ears in the condition of that now represented, with a view to sowing the corn apart, for the sake of the possibility that the tendency to branch may be strengthened and perpetuated. It is entirely consistent with all we know of the nature of plants that this should occur; not, indeed, in every seedling obtained from a branching ear, but in some one of them. Such a case should again be reserved and sown apart; and if but one case of a branched ear should occur in the third generation, the habit of branching may be regarded as fixed; while the degree of it may be expected to go at least as far as in the Egyptian Wheat.

This is a point to which the attention more especially of allotment-holders should be directed. It is even worth consideration whether it might not be desirable to sharpen the perception of the allottees by offering some small rewards for each branched ear that should be brought in.

IT is now about eighteen months since M. TULASNE published his interesting paper on the production of a little purplish stipitate Sphæria from Ergot. He did not give any indications of the method which he used to effect the fructification of the mycelium, but it appears from the observations of Mr. BROOME and ourselves that nothing is more easy, and that it can be reproduced at pleasure by any gardener who has a common greenhouse at his disposal. It is necessary only to fill a well drained pot with light soil, on the top of which the Ergot should be placed with only enough mould to insure its being constantly covered. It must be occasionally watered lightly with a fine rose, and, to prevent its becoming too dry, the whole should be covered with a glass, taking care, however, that the pot should not be positively damp, or the soil mossy, from too strict an exclusion of air. Mr. BROOME'S Ergot was sown in September, and produced a crop of Sphæria the following June. Our own was not sown till April 5th of the present year, and the

first Sphæria appeared on the 1st of August. The Ergot in our case was that of Wheat, but Ergot from Rye Grass was sown at the same time, and is now showing little heads, which are, however, at present in an infant state, without the slightest trace of stem. It would be well for those persons who wish to repeat the experiment, to sow the Ergot soon after it is gathered, as they will probably have a more abundant crop. They must also be prepared to exercise a little patience, as the result will not be obtained at once. Mr. Broome remarks that the growth of the Sphæria has no analogy with that of those species which are produced on insects, as the well known New Zealand species on Hepialus virescens. Any Ergot placed in favourable circumstances would produce its Sphæria, but one could not be sure of a crop of Sphæria entomorrhiza, by sowing Lackey Caterpillars. *M. J. B.*

VEGETABLE PATHOLOGY.—No. XXXII.

142. All considerations of temperature, as regards plants, are greatly affected by radiation. Hence plants which flourish in a country where the sky is constantly clouded are ill prepared to sustain the effects of radiation in our northern climate, where the nocturnal sky, especially, is frequently without a cloud, and acts most powerfully in reducing temperature. This, for instance, is one of the great difficulties with which we have to contend in the cultivation of many of the beautiful Rhododendrons which clothe the Alpine steeps of Sikkim and the neighbouring provinces. Radiation, whether upwards or downwards, is easily modified by the intervention of a screen, and it is mainly on this principle that the various instruments used for shading plants in winter act, where no heat is employed, or for the protection of plants from the injurious effects of direct sunlight.

143. Plants often suffer from the convergency of the sun's heating rays by means of discs of water acting as lenses on the leaves. There is, however, reason to believe that water, under such circumstances, especially when it does not readily evaporate, exercises a peculiar chemical action, which is destructive to the subjacent tissues. The mischief done by the concentration of the sun's rays, by means of irregularities in the glass, in conservatories, on delicate leaves, is often very considerable. The tinting of the glass does not seem to be an efficient protection, as was once supposed to be a probable result of using a pale green glass. This, amongst other matters, is needful to be kept in mind in estimating the diseased appearances manifested by plants under cultivation in conservatories.

144. It was stated that each species requires a particular temperature for its normal development. Within certain limits, fruitfulness and health are maintained; but beyond these either or both are apt to fail, if not at once, most commonly after a time. Many plants, for instance, will have fruit year after year when grown in the open air, which are worthless if they have been forced once or twice to bear fruit prematurely. Too great a stress has been laid upon the vital powers, which in consequence suffer reaction, and either a state of rest is required to re-establish them in full vigour, or they are never fully recovered. When plants like Gooseberries or Apples are removed to tropical countries, the effect is soon evident in the unnatural development of foliage, twice a year or more, and the consequent gradual loss of health and fruitfulness; whereas in other cases, where the object of cultivation, as in Cabbages, is to retard the time of flowering to the latest moment, the flower stem at once runs up, and in consequence no mass of blanched nutritive leaves, or, as it is more commonly termed, no heart is produced. In almost every plant of more than annual duration a long period of rest is necessary to prevent the exhaustion of the vital powers consequent on constant excitement. This is sometimes effected by cold, sometimes by heat and attendant dryness of the atmosphere. The nocturnal depression of the thermometer answers the same end; only the rest is one of a few hours instead of as many weeks or sometimes months. The one is, as it were, the long vacation, the other the nightly cessation of labour.

145. Knight has stated that heat has a powerful effect in causing the development of male flowers in diœcious plants. We are greatly inclined, from our own observations, to doubt the correctness of this. In the growth of Melons, at least, we have found rather the contrary law to obtain, a circumstance which, in that instance, may be due to the comparatively greater number of male flowers natural to the plant under all circumstances.

146. It is very rare that plants manifest any immediately sensible degree of proper heat. Such cases are confined to the organs of impregnation, as in the notorious case of certain Arads. It is very possible that such instances, only in a less perceptible degree, may be more common than is imagined, but at present direct observations are wanted in confirmation of the supposition. It has been shown, however, by Dutrochet and others, that when plants are placed in a medium thoroughly saturated with water, so that no evaporation can take place, they do give indications of proper heat, though not so striking as that of *Colocasia odora* (see various notices in Annales des Sc. Nat. ser. 2. v. 12).

147. When the thermometer is very high, and the heat unaccompanied by moisture, the whole plant is rapidly withered, without any marked decomposition of its parts; but when the thermometer is greatly depressed, the effect, like that of boiling, is a solution of continuity in the several parts, inducing rapid decomposition on the re-elevation of the temperature. M. Dunal has published a paper on the effects of congelation on plants, which was read before the French Academy, Feb. 21, 1848, in which he states that the cell walls are not ruptured during congelation. Whether this, however, be the case or not, is of little consequence if the vitality of the inner cell wall be destroyed, as the contents of the cells will in either case be subject to mere chemical or mechanical laws, and decomposition is sure to take place after a short time. The distinction, however, is sometimes only partial, especially in trees and some of the larger herbaceous plants, and consequently even where great mischief is done, life may still be maintained in such a portion as to admit of the proper end for which the plant was intended being fulfilled, or even of the mischief being, after a time, entirely repaired, as far as outward appearances are concerned. One of the most familiar instances is that of the greater or less degree in which such plants as Broccoli are affected by frost. So long as the degree of frost is only sufficient to affect the foliage, little mischief is done; but if the stem is affected, there is always more or less damage, according to the depth to which the frost has reached. If the bark only is affected, the central bud will be supplied with nutriment by means of the still living tissues of the stem, and the head be perfected, though it will be small in size; and if the evil has extended deeper, the head will wither just before its perfection, or entirely decay. The same principle applies to forest trees, and in consequence, in those countries where trees are liable to be injured by severe frosts, the fissures and congealed patches may be traced at every period of growth, however remote, so long as the wood is not decayed, insomuch that the trees are a living calendar, indicative at once of favourable summers, by the breadth of the rings of growth, and of the severe winters, by the number of rings by which the frost-bitten patches are covered. *M. J. B.*

PEAR CULTIVATION.

In common, I should expect, with many of your readers, I have been interested by the remarks of M. de Jonghe on our Pear culture; it is rarely we can get such from a foreigner—they are therefore of much value, stirring us up, as it were, and making us look more closely into our trees, and our management of them. I cannot help, however, regretting that M. de Jonghe has not lived in England, within thirty miles of London, these last seven years, just to have experienced the effects of severe spring frosts in a humid climate like ours, very unlike, in that respect, the climate of Brussels—he would then have been able to have said to a certainty if thinning out the branches and blossom buds of Pear trees would make the blossoms strong enough to resist eight or ten degrees of frost. Plain facts, in all gardening matters, are far better than speculations, however well based; such, I am sure, you will allow me to give, and it happens that I am able to give the result of grafting Pears on tall stocks, and also those from careful thinning of the trees and bearing spurs. About 14 years ago I purchased from a nursery, then what is called overstocked with Pear trees, about 500 tall Pear stocks, about seven years old, six feet high, and very healthy and vigorous; these were planted in rows in a good sandy loamy soil, resting for the most part on clay, and between each standard was planted a stout dwarf stock. They were suffered to grow one season, and then all grafted with the Beurré Capiaumont Pear—they grew beautifully and vigorously, and in 1844 bore quantities of fine fruit—the same in 1845; their branches were thinned out in the autumn of that year, and the trees were in the most vigorous and healthy state, but a frost destroyed all the blossom in the spring of 1846. In 1847 they gave a good crop of fine fruit; in 1848 5° of hoar frost on the 27th of April destroyed all the blossom, and from that year to the present inclusive, although the trees have been full of health and vigour, the blossom has been destroyed. It thus seems that no health, no vigour, no culture, can make the blossoms of one of our hardiest Pears (for such I have found the Beurré Capiaumont to be) withstand hoar frosts in spring; for in 1848 my trees were in the extreme of health and vigour, and yet 5° of hoar frost in cold damp weather destroyed all the fruit; and last spring (1854), the quantity of fruit perfectly set and rapidly swelling on a large number of Louise Bonne Pear trees, all in fine health and thinned and pruned every year, was quite astonishing; but 7° of frost on the 25th April totally destroyed all. How, then, can we think for a moment that care in pruning will save us from such frosts as we have had in the south of England these seven years past? I have had this season a remarkable opportunity of testing the efficacy of thinning out the blooming spurs of Pear trees, and the ability of vigorous spurs thus thinned out to resist frost; for on a trellis under glass I have some trained Pears in a fruiting state, and owing to the dry and favourable climate they ripened their wood in perfection last year, and formed vigorous fruiting spurs; the trees are six years old, so that I, in order to have a few very fine fruit, did not leave more than 10 or 12 fruiting spurs on each tree, and on a few there were only two or three; the flowers they gave were so vigorous, that those of Beurré Diel were like small Roses. The fruit was all set and swelling fast, but the frost on the 25th of April penetrated through the glass and killed them all, not leaving one perfect fruit.

Thinning the blossom-buds of Pear trees, whether on walls or cultivated as pyramids, is good culture, and cannot be too much recommended. In a pamphlet, the first edition of which was published some 15 years since, in p. 20 I have, in common with others, recommended it, so that it is no novelty; but to a certainty it will not, as asserted by M. de Jonghe, save us from the effects of our hoar frosts in spring. He is, I well know, full of enthusiasm; for on a visit he paid me lately, when, on account of the weather, I could not show him all my trees, he pointed to some trees of Beurré Capiaumont, by far too much crowded with branches, and said triumphantly, but good-naturedly, "Oh, there now, you have lost all your fruit; from such barbarous culture the trees cannot support the enormous quantity of bloom; they exhaust themselves in putting it forth, and consequently all drops off without giving any fruit." I, in this instance, humbly acknowledge the "errors of my ways" in allowing the trees to be too much crowded, but I, knowing our climate well, stoutly resisted the inference, and so I immediately took him to look at some fine healthy pyramids of Louise Bonne of Jersey Pears, 10 years old, which have been thinned and pruned, and regulated *secundum artem*. M. de J. held his peace, but allowed that our frost in spring must have been very severe. I have visited the fruit gardens of Belgium more than once or twice within these seven years, and till this year their crop of Pears has been in most places a total failure, owing to the cold springs. This season Belgium, in common with France, did not suffer to any extent from the severe frost which devastated our gardens, for in p. 453 I have, as "T. R.," mentioned the vast quantity of fruit in France; but till this year those fine and beautifully trained pyramidal trees of Monsieur Cappe, in the Jardin des Plantes, have for the most part been bare of fruit; and I observed when in the garden of M. Jamin, at Bourg la Reine, in June last, that all his well trained and beautiful pyramidal Pear trees were bare of fruit; these are all on Pear stocks, and most vigorous and healthy, and yet they could not resist the season. The situation is low and damp, which M. Jamin alleged as a reason for their shedding their fruit; I mention these facts to show that no pruning or training can resist the adverse effects of climate.

With respect to the observations of M. de Jonghe, in p. 388, I can assert, from the experience of 20 years, that no matter what climate your tree is imported from, if it is a hardy sort, and has good culture, it will grow well. I have, for the sake of experiment, imported some trees of the Glout Morceau Pear from the extreme south of France, and have planted them alongside some received from Belgium and Paris, and others of my own grafting, giving to all the same culture; if there has been any difference after three years it has been in favour of those from the south of France, and I have also proved that Pear trees on seedling stocks—which, according to M. de Jonghe, "send strong roots into the ground, are more vigorous, have more sap, and are better able to resist the drought and cold of spring"—are the worst of all trees for our gardens. In our moist, cool climate it is absolutely necessary to keep the roots of our Pear trees as near the surface of the soil as possible. In a cold deep soil, on which my experiments are tried, I find that the trees of many kinds of Pears can only be kept healthy and in a bearing state by regular biennial lifting, and bringing their roots to the surface.

In his remarks, in p. 388, on the soil and climate of Cheltenham, M. de Jonghe reminds me of too many Englishmen who when they cross the water forget to make a proper use of their eyes; and because they do not see, they fancy certain things do not exist. In the market gardeners' nurseries, and also in the private gardens of Cheltenham, are some of the most healthy and vigorous trees I have ever seen of Marie Louise, Louise Bonne, Passe Colmar, Glout Morceau, and other first-rate Pears; no insects ever trouble them, and in some of these gardens the trees are thinned out, and well regulated. From 1842 to 1846 I never saw finer specimens of fruit of Marie Louise, and others of the above sorts, than I saw at Cheltenham; but since then, nearly every year has been a complete failure. In conversing with a fruit-grower there lately, he agreed with me that no trees could be more vigorous and healthy than those in the gardens at Cheltenham, the deep loamy soil of the valley of the Chelt being so highly favourable to their growth; but that he now quite despaired of making his Pear garden profitable, as the spring frost killed all, or nearly all the bloom every season. I consoled him with the idea that our cycle of frosty springs was now over, and that the old good times when he grew such fine Marie Louise Pears would return.

M. de Jonghe thinks that the hardy sorts raised by the late Van Mons and Esperen will withstand our spring frosts; many of them are excellent, and hardier than such sorts as Winter Nelis, Beurré Rance, and Beurré d'Aremberg. I have bearing trees of them all, but not one has withstood the frosts of last spring. The Pears raised by the late Mr. Knight are (although not all of first-rate quality) the hardiest of all I have ever yet seen, but even they are this season bare of fruit.

At p. 484, M. de Jonghe adverts to the trees in the neighbourhood of London being of late years unproductive. In some of the extensive Pear gardens around London, including those in the garden of the Horticultural Society, the trees are thinned out every season and carefully attended to, yet they have all failed to give fruit for several years past; even those fine healthy trees in the valley of the Thames, near Rotherhithe, have had their blossoms killed, but this year, like those on the continent, they have escaped, and are bearing

fine crops. I mention this to point out to M. de Jonghe that, for the most part, it is not the lack of culture but the untoward springs that have made our trees barren. With regard to his theory of grafting on tall stocks, I have only to remark that in my plantation adverted to at the commencement of this article, those grafted on the dwarf stocks are much finer trees and more productive than those grafted on the tall stocks; to quote M. de Jonghe, this (grafting on dwarf stocks) "is an error, and contrary to all physiological principles;" yet my trees grafted as dwarfs persist in growing and bearing better than their taller brethren. The recommendation of M. de Jonghe to take grafts from healthy trees is good, and a well established truism; but here again Nature makes strange work and upsets our prettiest theories. Some years ago I found the taking of grafts from the upper part of a bearing tree recommended as the most eligible to form a healthy tree. I did so; and for the first three years I was much struck with the difference in the growth of the trees, but after the fifth year no difference either in size or productiveness of the trees was perceptible. And again, some years ago, I took grafts from a decrepid Golden Pippin tree existing in an old orchard in this parish and in the last stage of decay; the grafts the first season grew weakly, but their progeny are now as fine and as healthy trees as can be seen. I do not, as you perceive, theorise, I only give hard facts, the fruits of 30 years' hard work in frosty and foggy, but healthy and wealthy old England.

In conclusion, I only wish that I had the fine dry warm summers and the sharp dry frosty winters of Brussels in which to grow Pears for the London market. *Thos. Rivers.*

ACHIMENES.

The various attractions of this lovely tribe of plants render them especially adapted for decorative purposes. Their numerous gay and pleasing shades of colour, their variety of form and foliage, combined with a generally compact habit of growth and profusion of bloom, their easy cultivation and their flowering in a small state, are all qualities which especially recommend them to the notice of amateurs of limited means. Though essentially summer-flowering plants, the season of bloom may be prolonged for some months by a succession of younger growth; and where a sufficiency of light and heat can be obtained, some kinds, as Picta, and others of like habit, may be kept in flower during winter. Their more attractive season is, however, the summer and autumn months. During the growing period they delight in a warm, moist atmosphere, and when in bloom they may be removed to a close part of the conservatory or greenhouse, or, if required, to a sitting-room, but the blooms will not be so fine there as in a more genial atmosphere.

The general method of obtaining plants is from the small scaly-like tubers of the previous year's growth, which are produced in abundance. For winter-blooming it is, however, more desirable to propagate from cuttings put in in the latter part of summer. This method is also adopted for increasing new or rare kinds; but this being more the nurseryman's province than that of the amateur, I shall confine myself to general management.

The time at which the tubers may be started must depend on the season at which the plants are required in bloom; if started in February, the more dwarf-growing kinds will flower early in June, and a succession of tubers planted up to that time will ensure blooming plants to the latter part of autumn. Presuming that a supply of tubers of desirable kinds are at hand, they should be carefully shaken out of the soil they have been kept in during their season of rest, some well-drained pots or pans should be provided, and filled to within 2 inches of the top with a light rich sandy soil. On this the tubers should be placed rather thickly, and covered to the depth of an inch; they should then be moved to a close warm situation; a pit or frame, where a little bottom-heat is available for plunging the pots in, is most suitable when started early in the season. Water should be given sparingly until the plants appear above the soil, when a more liberal supply will be necessary; but in this and the later stages of growth it should be judiciously applied, as the Achimenes is very susceptible of injury by overwatering at the roots. When about 2 inches high, the plants may be potted into 6 or 7-inch pots. If it be desirable to flower them in this size, from four to six plants will be sufficient for each pot; but if larger specimens can be conveniently accommodated, a larger number, say eight to twelve plants, will be requisite. After potting, place them in a close warm house for a few days; when re-established, air may be admitted more freely on favourable occasions, and the plants kept near the glass, to prevent their becoming drawn; a slight shading will be required in bright sunny weather, and a genial moist atmosphere must be maintained.

When well-rooted and in vigorous growth the plants should receive a final shift into pots or pans; the roots delight to ramble near the surface of the soil, and for this reason I prefer pans for large specimens; these are from 12 to 16 inches wide by 6 inches deep; over the bottom I place an inch of broken potsherds, and on this a thin layer of fibrous matter to prevent the soil mixing with the drainage. If pots are used, one-third of the depth may be safely filled in the same manner. In potting, the ball of soil should be placed as entire as possible in the centre of the pot or pan, sufficiently below the top to allow a slight surfacing of mould among the plants when filling up with soil. After completing this operation, remove the plants to their former quarters, where the advantages of light and warmth can be derived; and encourage a vigorous growth by keeping up a moist atmosphere. As it becomes necessary, attention will be required to tie and otherwise neatly train the branches, so that they may present a compact mass of bloom. Some of the more erect strong-growing kinds may be stopped once or twice during their growth, to preserve a dwarf habit. When the plants are in bloom they must be carefully hardened before removal to a cooler situation, and they should at all times be guarded against currents of cold air.

After flowering, the plants should be again placed in a warm house, and water gradually withheld so as to mature the tubers. When the soil becomes quite dry and the foliage decayed, it should be cut off down to the surface of the soil, and the pots should be placed on a dry shelf secure from frost, where they may remain until required for the following season.

The soil most suitable for the growth of the Achimenes is, equal parts sandy loam, peat, and well-decomposed cow-dung, adding a liberal supply of sharp clean sand. The loam and peat should be broken into small pieces, the cow-dung sifted, and all well mixed together previous to use. *Alpha.*

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVÉLIERE, NANTES.—By Himself.

(*Continued from p.* 485.)

Zephirin Gregoire.—Tree vigorous, and an abundant bearer, suitable for a pyramid or standard, or it may be planted against a wall with either an east or west aspect. It is better worked on the Quince than on the Pear stock. Fruit middle-sized or small, about 3 inches in length and 2¾ inches in diameter, obovate. Stalk nearly an inch in length, obliquely inserted; eye open, in a shallow cavity; skin smooth, green, dotted with brown, becoming yellow as the fruit ripens; flesh greenish white, fine, melting, buttery, with abundance of sugary perfumed juice. Season, November till February. Obtained by M. Grégoire, at Jodoigne, and is one of the most delicious Pears we know.

Triomphe de Jodoigne.—Tree vigorous, and may be worked either on the Quince or Pear stock, and trained as a pyramid. Fruit large, obovate, about 3½ inches in length, and as much in diameter at the widest part. Stalk short, thick, inserted in a small cavity, near which the fruit forms some strong projections. Eye large, deeply sunk in a ribbed cavity. Skin fine, shining, pale green, marbled with brown, especially near the stalk and eye; it changes to citron yellow when the fruit is mature. Flesh white, buttery, very melting, and juicy, with an agreeable perfume. Season, November and December. Obtained, in 1843, by M. Simon Bouvier, of Jodoigne, Belgium.

Beurré Comice de Toulon.—Tree vigorous and productive. We are of opinion that it is suitable for a pyramid or a wall; but we have only had an opportunity of judging from the growth of some young trees in our nursery. A superb fruit, measuring from 5 to 5½ inches in length, and 10½ inches in circumference. Oblong-obovate, terminating at the stalk with a projection, somewhat resembling a bird's head, of which the stalk, 1½ inch in length, appears like the beak. Eye open, in a deep, moderately wide cavity. Skin fine, smooth and glossy, pale yellow, sprinkled with red dots, which are deeply coloured next the sun; the shaded side and round the eye is freckled with olive brown. Flesh fine, white, melting and juicy. Season, November and December. Raised by M. Flory, a horticulturist at La Valette.

Home Correspondence.

How to destroy Aphides on Bedding Plants.—During a visit to a friend in Devonshire, about a month ago, I was much struck with the appearance of his parterres, then gay with various bedded plants in the best possible condition; all I had theretofore seen and since inspected were in a very different state, the complaint of green fly being general this season, even in grounds where pains and expense are not spared. On inquiring how this was effected, my friend informed me that he was visited like his neighbours with aphides, but that, so far as regarded low-growing plants, the remedy was speedy, certain, and simple; his plan being as follows. He has four slight wooden boxes without bottoms, about 20 inches deep, made to fit just within the edging of the divisions of his parterre, all the divisions being precisely of the same size and pattern, so as to admit of a box fitting either one. He places a box upon each, presses down the edge, and through a hole in the end introduces the spout of his fumigator, and having filled one box with smoke, plugs up the hole and proceeds to another. He uses dried stuff (?) with a mixture of tobacco, and fills four boxes with each charge of his fumigator. The smoke being injected cool, he is able to remove the box after four or five hours, taking care to admit the air gradually; and he contrives to smoke three times, or 12 divisions in the 24 hours, without causing the bloom to drop, as it would do—and does, in fact, when he uses tobacco paper, or ignites within. I saw one operation performed on the four boxes in about as many minutes, and nothing could be more effective. Now, it has occurred to me since witnessing this that we have the solution of a problem which has puzzled me and others, and that I shall be doing my fellow florists a service by making it known. Hitherto it has been easy enough to fumigate houses and frames, either with the fumigator or by burning tobacco paper and other combustibles in them; and even standard Roses I have seen fumigated by covering them with an oil-skin bag distended on a parasol; and, moreover, shrubs and plants of tall growth are often dusted with snuff, or covered with tobacco-water or other solution—all, however, tedious and uncertain operations; but to clean plants, such as Verbenas, &c., pegged to the ground, has hitherto been considered an impossibility. And why should not this plan be applied to borders of any length? It would only be necessary to mark them out in equal divisions, keeping about 3 inches of space unplanted between each division, and so covering them with boxes made to fit these divisions. Again, market gardeners might avail themselves of the process to fumigate Strawberries; and by providing a lot of old casks, with one end knocked out, and past use for other purposes, to be procured very cheap at cooperages and pitched over; or they could cover their shrub fruit, such as Gooseberries, Currants, and Raspberries, and bring it to market in such a clean state as would give it a preference, while they insured the crop, now often injured and sometimes totally destroyed by aphis and other vermin. I would suggest that, when the divisions of flower parterres are cut out in fanciful shapes the covers might be made of tin, fitted to the parterre, and riveted upon an iron frame round the bottom; these being painted occasionally would last for many years. *M. C.*

Influence of the Dark Spots on the Solar Disc on the Earth's Temperature.—The ungenial character of the present season forcibly reminds me of the speculation ventured by Sir John Herschel in 1801—that the dark spots on the solar disc had a very close connection with the temperature of the earth; and as it is possible by opening up the matter for discussion in your pages that many suggestions, valuable alike to the agriculturist and gardener, may be elicited from some of your scientific correspondents, I will offer no apology for introducing the subject. Since the time that Sir John made the observation, I believe other astronomers by repeated observations have decided that the spots move in cycles of 10 years—that they reach their maximum and sink to their minimum in periods respectively of five years, and that the mean annual temperature of the earth is highest when the spots are at their minimum, and *vice versâ*. In the last year the number of spots on the sun's disc was at its maximum, and in our climate the temperature was below the average of our seasons, affording a remarkable instance in support of the correctness of the theory. This year I think affords another instance, and if we look back to the summer of 1852, I presume that an additional proof will be found, that the increase and decrease of the mean terrestrial temperature bears a corresponding ratio to the increase and decrease of the number of solar spots. I need not again insist on the great importance of the subject to all engaged in the cultivation of the soil, nor to the great advantages that would accrue from information affording sufficient data, from which the chances of a bad or good season might be calculated. I say chances, for I believe it impossible ever to afford more than an approximation to the truth; but the slightest addition to our present stock of knowledge cannot fail, in proper hands, to be of essential service not only to those immediately connected with the soil, but to all mankind. Those, therefore, who have made the subject their study cannot do better than give mankind the results of their observations. *Beta, Union Road, Plymouth, August 7.*

Galvanised Iron Wire.—Permit me to ask your correspondent who complains of the ill effects of this wire on his trees trained against it, whether or not the trees had been previously nailed to the wall? If so, whether or not any disease of the kind was observed then? Have they been tied so tightly as to cause injury, or are the borders dry and the roots near the surface? My reason for asking these questions is that the garden walls here are all wired with galvanised iron wire, and after six years' experience with it I have not found a single branch affected by the wire. *G. L., Osmaston Manor, Derby.*

The Potato Disease, I am sorry to say, has manifested itself in South Wales in its most virulent form, and already two-thirds of the crop may be reported as gone. For more than six weeks I have noticed it, more or less, on both early and late varieties; and only on July 26 an unusually wet season was brought to a comparative close by a thunder-storm such as has not been known here for more than half a century, and the destruction of property is immense, in some places whole gardens being washed away—not the plants only, but the soil to the depth of 18 inches, and even the garden walls. The storm was accompanied, and followed for a day or two, by very close hazy weather, and then the disease spread like lightning, and what before were very fine crops now do not yield "two sound Potatoes in 20 yards." Hagues' Seedling was the first to show the disease, but being tolerably ripe it has not spread so rapidly as over later kinds. Ash-leaf Kidneys, left for seed, and planted on a newly broken piece of ground full of Couch and rough herbage, are comparatively sound, but some "Rogues" in the same rows, a late white kidney, are completely rotten. The Potatoes here are planted à la Cuthill, and are manured with soot and salt, as directed by that authority; but they are not more free from disease than others in the neighbourhood planted on the old plan. The garden here is a shallow gravelly loam

resting on a bed of rough gravel, and so open and porous as to be dry and workable directly after a heavy rain. It slopes to the west, and is just such a soil as at the present time would be selected to yield good sound Potatoes. The sets were got in in good time, in rows upwards of 3 feet apart, and the plants were as healthy and promising for a crop as could be desired; but all are gone, or nearly all. I am now hoeing the ground, and sowing Red American Stone Turnips over the rows; these will be ready to pull in October, and then perhaps the ground may yield a few sets fit for planting. This place is 11 miles from the sea in a direct line; but near the sea the disease is not nearly so bad; and it is singular that within the influence of the copper smoke near Swansea and Llanelly, the Potatoes have never suffered much from the disease, though in other respects they do not wear the most healthy aspect. Other crops in this part of the Principality are remarkably fine. Wheat, Oats, and Barley on Mr. Lawford's farms I should think could not be surpassed either in England or Scotland, and Turnips and Mangold Wurzel are very promising, considering the guano mongers had played us a trick to the tune of two-thirds the value of the quantity supplied, *which they have had to refund.* The adulteration of the guano was discovered by the water prepared from it failing to impregnate the atmosphere of the forcing-house with ammonia, as I had been accustomed to, and on examination the fraud was soon discovered. *W. P. Ayres, Tirydail, South Wales.* [Another year try Fluke Potatoes.]

Clerodendron Bungei, alias fœtidum. — Perhaps "A. H." would like to know that a plant of the above survived a sharp winter in Messrs. Standish & Noble's nursery at Bagshot, and pushed up strong shoots from the roots in the spring. This was without any protection. All above ground in the winter was destroyed. M. Ortgies, of Ghent, M. van Houtte's representative, informed me a few weeks since that it is also quite root hardy in Belgium. I think it about as hardy as a Fuchsia. In lately noticing this plant in the *Chronicle*, you said, "If we can trust a figure of it published in the 'Flore des Serres,' it must be remarkably handsome." The drawing for that plate was made by me, and if (as I am assured, for I have not seen the plate), it is a correct copy, I can vouch for its accuracy to nature in size, form, and colour. The plant from which the drawing in question was taken had four such corymbs, and was clothed with its large handsome leaves to the rim of the pots. If well grown, and it requires very liberal treatment, it is indeed very handsome; if starved, it degenerates to a scarecrow. The flowers are very sweet-scented. I should add that a plant which flowered in Belgium was quite equal to the drawing made here. *George Lovell.*

Damp of Limestone Walls, how caused.—Are they damp? It is worth inquiry whether the appearance of damp does not arise from the compactness, the close grain, of the stone, which cannot imbibe. When the atmosphere is charged with moisture and the temperature rises, the vapour which comes in contact with colder surfaces is speedily condensed, and has the appearance of exuding from walls which really reject it, whilst a more porous material rapidly takes it in. Observe the difference of a wall oil-painted and another merely coloured; the former may be seen covered with pretty globules of water when the latter has no appearance of them. So with a China plate and unglazed pan held over steam. The supposition that limestone was in itself damp cost me both trouble and cash, and I suggest the above view to your correspondent "Somerset," in the hope that it may save him both. *D. V.*

Orchids.—May the following be considered good specimens, viz., a Stanhopea insignis with 52 flowers upon it, 22 of which are in perfection to-day (Aug. 7); S. Bucephalus var. guttata (a small plant) with three spikes—the best 21 inches in length, and bearing 16 flowers—the other two having 15 each, but one of them unexpanded; Acropera Loddigesi with 20 spikes, 10 of which are in full flower, with from 15 to 27 blooms on each? *J. N. Corehouse.* [They would appear to be *very* fine specimens.]

Euphorbias.—The following species are easily cultivable out of doors in England. Those with an asterisk attached to them are half hardy. Shrubby:—E. spinosa, ceratocarpa, mellifera, *dendroides, *fruticosa, and *Pithyusa. Herbaceous (stems annual): E. palustris, Persica, glareosa, carniolica, Gerardiana, Nicæensis, Cyparissias, and dulcis. Herbaceous (stems biennial): E. saxatilis, myrsinites, rigida, Characias, melapetala, veneta, amygdaloides, *Paralias, and portlandica. *S.*

Aquatics.—Having some aquatic plants in earthen and metal pans, I find they get covered with a sort of parasitic verdure, which I believe is a Conferva. Is there any way of getting rid of it? *A. H.* [Only by keeping the water in constant motion.]

Foreign Correspondence.

Melbourne, N. S. Wales, May 4, 1854.—The second exhibition of the season of the Victoria Horticultural Society, instituted 1849, took place in these gardens on the 28th of February, and considering the time of year, the gardens were in good condition. In the morning the weather looked unfavourable, but as the day advanced the clouds cleared off and the afternoon was agreeable. The gardens were opened at 2 o'clock, but the attendance, doubtless owing to the threatening aspect of the morning, was not so great as might have been expected. Surrounded as we are by neatly built English looking villas, together with the many British plants scattered throughout the gardens, and the numerous happy faces that met one at every turn, made us almost imagine we were in England. A military band was in attendance. About 2 o'clock his Excellency and suite paid the gardens a visit. The display of flowering plants was deficient, but fruits were plentiful.

Of plants there were examples of Juannulloa aurantiaca, Ixora crocata, Rondeletia speciosa, Torenia asiatica, Streptocarpus Rexi, Achimenes grandiflora, A. pulchella, A. floribunda, A. longiflora, Chiococea racemosa, Gesnera zebrina, G. tubiflora, Calanthe australis, Gloxinia candidissima, Vinca rosea, Passiflora elata, Salvia splendens, Lantana crocea, Begonia Evansiana, B. semperflorens, B. argyrostigma, Manettia glabra, Justicia picta, Asclepias curassavica, Plumbago Larpentæ, Gloxinia atrosanguinea, and a seedling Mimulus named Sir Charles Hotham.

Of Grapes there were the following sorts: Black Hamburgh, Black Cluster, Black Muscat, Black Damascus, Black Prince, West's St. Peter's, Muscat of Alexandria, Chasselas Musqué, Sweetwater, Muscatel, Wantage, &c. A general collection of all fruits in season consisted of Grapes, water and other Melons, Peaches, Plums, Pears, Apples, Morello Cherries, Almonds, Medlars, Filberts, &c.; dessert Apples comprised Pearmain, Red Quarrenden, Golden Reinette, Early Juneating, Balgony Pippin, Victoria, Golden and Ribstone Pippins, Braddick's Nonpareil, Brown Russet, Cornish Gilliflower, Early Margaret, Sykehouse Russet, and Scarlet Nonpareil; baking Apples were Yorkshire Greening, Kentish Fill-basket, Hawthorndean, Emperor Alexander, Keswick Codlin, Court of Wick, French Reinette, Northwood, and Beauty of Kent; among table Pears were Williams' Bonchretien, Autumn Bergamot, Summer Bonchretien, Chaumontelle, Beurré d'Aremberg, Swan's Egg, Black Achan, Gansell's Bergamot, and Colmar. Of Oranges there was a dish which the judges labelled "worthy of notice." They had been grown in the open air, at Heidelberg, a place within a few miles of Melbourne. Vegetables consisted of Cabbages, Carrots, Turnips, Parsnips, Cucumbers, Vegetable Marrows, Tomatoes, French Beans, Chillies, Rhubarb, Radish, &c.

On the 25th February, 1854, Pine-apples (imported) fetched from 1*s.* 6*d.* to 2*s.* 6*d.* per lb.; Grapes, 1*s.* 6*d.* to 2*s.* per lb.; Apples, 1*s.* to 1*s.* 6*d.* per lb.; Pears, 6*d.* per doz.; Peaches, from 3*s.* to 6*s.* per doz.; Plums, from 6*d.* to 1*s.* per doz.; Water Melon, from 1*s.* to 4*s.* each; Figs, 6*s.* per doz.; Cabbages and Cauliflowers, from 1*s.* 6*d.* to 2*s.* per head; Carrots and Turnips, 9*d.* per bundle; Onions, 8*d.* per lb.; Potatoes, 6*d.* per lb.; Cucumbers, 1*s.* 6*d.* to 2*s.* 6*d.* each; French Beans, 2*s.* per lb. Gardeners' wages per annum, with board and lodging, are from 80*l.* to 100*l.*; or 3*l.* per week, with cottage, wood, and water. General farm-servants, per annum, with rations, get from 70*l.* to 80*l.*

Owing to the extreme dryness of the season, the prospects of the gardener and farmer have been anything but favourable; no rain of any importance has fallen during the last four months. Harvesting has been completed, and the accounts from various districts state that the crops will be about one-third less in yield this year than has generally been obtained. The late crops, especially Wheat and Potatoes, have suffered severely; in some cases the latter crop is not worth lifting. During the summer, bush fires have been of common occurrence, and several stations have been swept with the devouring element, as well as fields of standing corn; and in some cases human life has fallen a sacrifice to it. The bush has been frequently on fire for miles together; the fire sweeps along with fearful rapidity, and for days the whole country is overspread with a thick misty smoke, which makes the sun appear like a ball of red fire. During summer we have found the thermometer to range between 90° and 100° in the shade, and on several occasions have observed it at 100° in the shade at 10 o'clock A.M.

The following plants were in flower around Melbourne during the month of February. Owing to the dryness of the season, there has, however, been a stinted supply of floral beauty, and what flowers were met with were, for the most part, growing by the side of Yarra lagoons and swamps. They consisted of Viola betonicæfolia, Bursaria spinosa, on the banks of the Yarra, its numerous white blossoms forcibly reminding one of our English "May;" Oxalis microphylla, Polycarpon alsinefolium, &c.; Epilobium Billardierianum, Lythrum salicaria, Loranthus sp.; this parasite is found in great abundance, hanging from the branches of the Eucalyptus and Acacia, each of which, I believe, have to bear a distinct species; Eurybiopsis Hookeri, Cotula coronopifolia, Lobelia anceps and pedunculata, Calocephalus lacteus, Goodenia ovata, Senecio odoratus, S. rupicola, Alternanthera denticulata, Damasonium australe, Ottelia ovalifolia (in the lagoons near the Yarra), Sporobolus matrella, Myoporum humile, Verbena officinalis, Mentha australis, Cynoglossum suaveolens, Erythræa australis, Solanum laciniatum or Kangaroo Apple, &c.

Of land, the large quantities which the Government has lately brought into market, coupled with the diffusive tendency of the land societies recently established in the colony, serving as a check upon the land jobber, have enabled every working man to become possessor of a building allotment or Cabbage garden, and small capitalists to become real settlers in Victoria, instead of being driven away by the enormous prices to the adjacent colonies where land is much cheaper. Formerly the greater portion of the lands sold by the Government were purchased by speculators, and who, but for the societies already mentioned, would still form an impassable barrier between the Government and the poor man. As an illustration of the successful working of one of these, I may instance that of the Victoria Land Society, which only started in August, 1853, and now numbers 642 members. It commenced operations on the 12th September, and the first purchases effected were at the Government land sales. The directors expended the sum of 7230*l.* in the purchase of town allotments at North Melbourne Coronilla, and about 30 acres of desirable suburban land at St. Kilda for building purposes, which was subsequently allotted amongst the members. The terms of this Society are 4*l.* per month on each share, until the property allotted to the shareholders be redeemed, the average value of each allotment to be about 100*l.* Thus by a system of co-operation the people are enabled to obtain the land direct from the crown at wholesale cost, instead of, as was formerly the case, obtaining it through the medium of the speculator. The amount added to the original cost of the land is stated to be about 8*l.* per cent. It is said that this society will be enabled to distribute within the first year of its existence 50,000*l.* worth of land amongst its members. *John Walters, Botanic Gardens, Melbourne.*

Reviews.

SILURIA. *The History of the Oldest Known Rocks containing Organic Remains, &c.* By Sir R. I. Murchison. Large 8vo. Murray; pp. 523, with numerous woodcuts and lithographic plates.

THIS important work is neither a revelation of the fancies of speculative progressionists, nor an argumentative treatise on things ethereal brought before mortal eyes by rapt astronomers. We have here no wordy war between Cambridge and Edinburgh settled by the intervention of geological protocols. Siluria is what Mr. Gradgrind would call a record of facts, facts, facts; it is, therefore, to visionaries as distasteful as the Geometry of Euclid, or the "Systema Naturæ" of Linnæus, or as Froissart's Chronicles. But whatever disfavour it may experience from gentlemen who would have men dream away their lives, is more than compensated for by the welcome it has received, and always must continue to receive, from the serious students of that cosmogony which is revealed to us by mighty records long buried beneath the surface of the globe, and only disentombed by modern industry.

When chaos settled into order, and the molten earth cooled down, living things first began to appear. Water teemed with elementary life; the fire-born rocks over which it rolled were worn down into sand and mud; islands appeared in a boundless ocean; land plants and animals were made to inhabit them; at vast intervals of time prodigious geological disturbances occurred; whole races of living things disappeared to be replaced by others; layer after layer of decaying organisms, crumbled rocks, or marine deposits gradually accumulated; and at last man made his appearance; since when no change in the order of things created along with him is known to have occurred.

The succession of deposits thus caused has been grouped and named by geological writers. Each group is sufficient to engage the life-time of an observer; the more recent being the most difficult to investigate, in consequence of the greater abundance of facts which they include. The most ancient are the most simple, but by far the most interesting, because it is here that we have to investigate the origin of life and those primitive forms, which have now assumed a fixed and final state. It is the primæval world that Sir Roderick Murchison has ventured to explore; and he has done so with learning and sagacity. His foundations rest on the evidence derived from organic remains; for that is certain; while all that depends upon mineralogical conditions alone sinks into comparative insignificance.

It is amusing to read the various opinions that have been held, from time to time, concerning the meaning of those fragments of living creatures which are found embedded in rocks and deposits of various kinds, and which we now comprehend under the general name of organic remains. If we remember rightly, Mathiolus, a great man in his day, gravely insisted that such fragments of animal and vegetable forms arose out of a certain *materia pinguis*, or fatty matter, set into fermentation by heat; in the same way, we presume, as Virgil's bees were engendered in the bowels of dead kine. Others substituted "plastic force" for *materia pinguis*, among whom was Dr. Plot, the well-known historian of Staffordshire. And then came Llwyd the Welshman, with his Lithophylacium, shocked at the idea of plastic force, which he regarded as atheistical, and who invented a certain subtle essence, or sperm, to which fossil remains owed their origin. This sperm of living things being carried into the air by vapours, and then deposited in fitting places, became whatever its quantity and efficiency permitted. Llwyd supposed that if the sperm was perfect whole animals or plants would be engendered in the earth—if imperfect, mere leaves would come, the teeth of fishes, or the jaws and bones of animals. Ray did not fail to expose these absurdities, but so little did he contemplate the possibility of organic remains having been buried in the rocks where they are now found, that he believed that animals at least must when young have insinuated themselves between the crevices of rocks, and so have reached their beds by subterranean ways.

We now know better, and can smile at the follies of

our ancestors. We now believe that the same races of animals and plants existed over vast spaces of the earth at the same time, and were swallowed up and exterminated by contemporaneous revolutions; so that a correspondence between the fossils of two distant geological formations affords the best evidence that such formations were cœval. Such is the ground taken by our author, and upon this recognised geological truth he has constructed his history of the primæval world. Caractacus little dreamed, when he led his Silures against the Romans, that his wild mountains would in future ages give a name to science, and that his petty province would extend its authority over all the earth. Siluria is the primitive living world; or, as Sir Roderick calls it, "the vast Necropolis of primæval life." Its history begins from the period of unfossiliferous igneous rocks, and continues till the days that succeeded the overthrow of the coal forests; a vast field for the geologist—an inexhaustible mine for the naturalist.

In space so limited as ours we can add little to what has been said. The reader will find Siluria rich beyond belief in geological facts, ably applied to geological theory; and he will gain a clear insight into the methods by which modern observers identify formations of what seem to be the most dissimilar kinds. How, for instance, it is that the mud and sand of Western Russia are determined to be contemporaneous with the hardest rocks of the Eastern Ural.

It is as well to add that although Siluria has formerly appeared in a more pretending form, the increase of knowledge has of late years been such as to render the present more convenient edition practically a new work. There is, moreover, a learned dissertation upon the gold-bearing rocks, whose riches have so suddenly dazzled the world. We recommend the learned author's opinion concerning this metal in Britain to the calm consideration of gold finders. "As no rich auriferous sand or gravel is known in any part of the British Isles, we may rest satisfied that in our own country, as in many others, the quantity of gold originally imparted to the rocks was small, and has, to a great extent, been exhausted."

New Plants.

74. Torreya myristica, *Hooker in Bot. Mag. t.* 4780; *aliàs* T. californica, *Torrey in New York Journ. Pharm.*

An excellent figure is here given of this fine evergreen coniferous tree, which has been raised by Messrs. Veitch. It is said by Mr. W. Lobb to grow 30 to 40 feet high, in the elevated regions of the Sierra Nevada of California. Its foliage resembles that of Cephalotaxus Fortuni. The seeds are as large as nutmegs, and have the same kind of alburnum (called by botanists ruminated), whence they have gained the name of nutmegs in California. We find the following account of them in the last number of the "Pharmaceutical Journal:"—"About a year ago (says Prof. Torrey) I received from the late Mr. Shelton, who had just returned from San Francisco, a specimen of what was called the California Nutmeg. I immediately considered it a species of Arnott's genus Torreya, belonging to the order Taxineæ of the great natural family of Coniferæ. It had been discovered but a year or two before Mr. Shelton left the country, and had already attracted considerable attention, not only from the beauty of the tree, but from the singular character of the fruit and kernel, the latter strongly resembling the common nutmeg. Indeed, it has been frequently stated in letters from California that the Nutmeg is a native of that country. The foliage has the form and deep rich green of the Florida species, or T. taxifolia, as well as of the Yew; but the leaves are much larger, being from 1¼ inch to 2½ inches long. They spread out on two sides, and are tipped with a sharp rigid point. The fruit, as it may be popularly called, is about the size and form of a Greengage Plum, and in the dried state has a pale olive colour, but this may not be its natural tint. The outer covering is a thick, fleshy, nearly closed urceole, or dish, which completely invests the seed, and closely adheres to it, except near the summit. It is smooth and even, and soft to the touch. The seed is usually oblong, and greatly resembles a large Pecane Nut, but frequently it is more ovate. The shell is smooth, thin, and fragile. On each side, near the summit and just below the non-adhering portion of the dish, is a perforation, communicating with an interior canal, similar to what I described in T. taxifolia, and the use of which is still unknown. The kernel is conformed to the shell, and has the external and internal appearance of the Nutmeg. When cut transversely the resemblance is perfect. The seed, however, is wholly destitute of the delicate aromatic odour of the oriental spice, for it has the strong terebinthine character of the Coniferæ. Neither is the fleshy covering of any known use. It is more probable that, like the fleshy cup-a-berry of the Yew, it is of a poisonous nature. Still the discovery of this tree is interesting to the botanist and to the horticulturist. But two other species are known besides. One of them (T. nucifera Sieb. and Zucc) is a native of Japan, and the other has only been found hitherto in Middle Florida, in very confined stations. The latter is erroneously stated by Zuccarini to have a seed as large as a Walnut, by which he undoubtedly means the Juglans regia, or Madeira-nut, as it is called in the United States. As an ornamental tree, the California Nutmeg deserves to be extensively cultivated. It must be hardy, as it grows on the mountains, where the winter is very severe. The enterprising Messrs. Parsons and Co., of Flushing, sent out a person to California for the express purpose of collecting the ornamental and useful plants of that country, and among other varieties he obtained, last year, some ripe and fresh seeds of the Californian Nutmeg. These germinated freely, and, when I saw the young plants last October, they had a healthy appearance, and had attained a good size. I have lately heard, also, that Mr. Lobb, an English collector, who has been exploring California for several years past, has sent seeds of this tree to England."

Garden Memoranda.

Messrs. Standish and Noble's Nursery, Bagshot.—Few nurseries possess more interest than this, not only on account of the number of valuable new hardy and other plants which it contains, but also in consequence of a large portion of ground along the frontage having been appropriated to the purposes of a permanent winter garden, an American garden, and a little farther back towards the centre of the nursery, a Sikkim Rhododendron garden.

The winter garden consists of a series of concentric circular beds divided from each other by gravel walks edged with Cotoneaster microphylla, which, when it shall have grown a little more, and been neatly clipped, will make a most excellent edging, being when trimmed into form extremely close and compact. The whole series of beds is cut through diametrically by a main walk leading from the entrance gate to Mr. Standish's house. The centre bed contains a dark coloured Holly, with a Weeping Yew on either side of the walk, and surrounding it are beds of gold striped Hollies, dwarf growing Conifers and other plants, many of them put in temporarily until it shall have been ascertained what is most suitable for this kind of gardening. Among plants which have been tried and found to answer are Skimmia japonica, whose fine evergreen foliage and brilliant coral red berries are extremely ornamental during the whole of the winter months, and no frost has ever hurt it in the least at Bagshot. What makes this plant all the more valuable, too, is that it fruits abundantly in a very small state. The Darwin Berberry has also stood the winter well, and flowers beautifully in spring; as do likewise Erica carnea, a Daphne called Delahayana, a dwarf kind in the way of Cneorum; and Rhododendron ciliatum and glaucum. In severe springs, like that we have just passed over, however, the flowers of the two Sikkim Rhododendrons get injured, though the plants themselves are perfectly hardy. Escallonia macrantha has also been found suitable for a winter garden, flowering, as it does, beautifully, in September; and Buxus Balearica is likewise a good plant for the same purpose, producing a cheerful effect in winter, and Azalea amœna is said to blossom beautifully in spring, when its rosy purple flowers are an acquisition. The uniform appearance which this garden would present, filled entirely with dwarf shrubs, is broken and well varied by the couple of Weeping Yews in the centre, and standard Bays planted at regular distances apart, while the whole is surrounded by a closely shaven lawn, interspersed with choice upright and conical growing Conifers.

A hedge and a long range of glass-houses divide the compartment just described from the American garden, which contains beds of dwarf Rhododendrons on Grass, with Conifers and standard Rhododendrons dotted here and there among them, producing a good effect either in summer or winter. A main central walk passing through this garden and over some rustic steps, similar to those represented at page 485, between old tree roots ornamented with Ferns, leads to the Sikkim Rhododendron garden, in which are standard plants of the different varieties of these Rhododendrons, rising from among beds of Ghent Azaleas, and the finer kinds of ordinary Rhododendrons, of which there are great quantities here, which, when in blossom, must indeed be brilliant and striking. Most of the Sikkims have proved hardy here, except Edgeworthi, which has been found to be very tender. Roses in pots, young plants plunged in the ground, occupy both borders of the main walk, and intermixed with the Sikkim Rhododendrons are standards of many new and fine kinds of Roses, such as General Jacqueminot and Gloire de Dijon, &c.

Among Conifers, Cephalotaxus Fortuni has wintered unhurt, and it is reported to have done the same in other places, where even Portugal Laurels have been killed to the ground. Funereal Cypresses planted in loam have stood well; but, in the common staple of the nursery (light sandy peat), young plants of it have been sadly cut up, and in many instances killed. Except in stiff loam, Abies Webbiana also suffers much from spring frost; but in that it is said to succeed better. All Conifers here are transplanted every two or three years, in order that they may move safely when required. As an instance of the good effects of this practice, it may be mentioned that while Cryptomerias, Thujas, Arbor-vitæs, &c., which had been so treated, were transplanted this spring without ever appearing to feel the change, red Cedars, coarse rooted on account of not having been periodically transplanted, when moved at the same time have all died.

A Pæony garden is the next thing which Messrs. Standish & Noble contemplate forming. For this the ground is to be trenched 6 feet deep, it having been ascertained that Pæonies, especially tree kinds, like plenty of root room. In this prepared ground are to be planted Mr. Fortune's Moutans, of which great numbers of fine plants are now growing in "craddles" here. They have sustained no injury from frost.

Under glass we observed flowering plants of the beautiful Clematis lanuginosa and its pale variety, both of which are expected to be quite as hardy as azurea; also plants of Podocarpus chilina and nubigena, Clerodendron fœtidum, a handsome half-hardy variety from the north of China, said to be suitable for a conservatory or cool greenhouse; Embothrium lanceolatum, and other promising plants. Examples of the fine Chinese Berberries, for which this nursery is so justly celebrated, were also growing in a border in-doors, with a view to get good sized plants of them quickly for planting out. Of the effects of the winter on these and other plants here, see p. 358.

In the open border we noticed the Chusan Palm, which is perfectly hardy, and a bush of Spiræa callosa, some 4 feet high and as much through, covered all over with broad flat heads of rosy flowers. This is a species whose handsome appearance must doubtless make it a favourite with everybody.

In a large piece of ground detached from the "home" nursery, but well filled with standard Roses, Conifers, and general nursery stock, we remarked a bed of Mount Atlas Cedars, growing luxuriantly, and not at all injured by the winter, while the common Cedar of Lebanon growing by the side of it appeared to have suffered. Juniperus sphærica has not been touched here in the least, nor has Abies Nordmanniana. In the centre of this ground is a broad walk, on either side of which has been planted specimen Conifers in pairs, which, when they shall have grown a few years more, will have a good effect. These borders are also well stocked with choice ornamental shrubs of all kinds.

FLORICULTURE.

Pot Culture of the Verbena.—As the Verbena merits a place, and most justly, among popular florists' flowers, perhaps a few hints on its cultivation in pots may be acceptable to those who have not hitherto adopted that mode of culture. I know of no plant more useful or ornamental as a pot-plant, for decorating the greenhouse during the summer season, when the proper inmates of that structure are enjoying the open air. If we take into consideration its graceful habit, the variety and brilliancy of its colours, which offer hues for every taste, and above all, the lengthened period it continues to produce its lovely blossoms, it is unrivalled and ought to be more generally grown in pots as specimens, more especially now that the numerous varieties are so much improved, both in form and colour. The present season has been productive of some gems of the first class; and if the Verbena continues to be improved as it has been during these few years past, I have no doubt that the time is not far distant when it will form one of the leading features at our floral exhibitions. I do not know if my system of propagating this favourite be new; but as it is simple, certain, and expeditious, it may be as well to state how I proceed from the commencement. I fill shallow pans (such as are used for placing under flower-pots) to within a quarter of an inch of the top with silver-sand, and pour in water sufficient just to cover the sand. I then make the cuttings in the usual way, and push them into the wet sand; put the labels to them, and place them in a hot-bed frame where the heat ranges from 65 to 70 deg., always keeping the sand wet. The advantages to be realised by propagating the Verbena in this way are, that the cuttings never require to be shaded in the brightest sunshine, consequently the young plants are not drawn up long and lanky; the cuttings never stop growing from the time they are put in until they are ready to pot off, which is in about six or seven days, when they may be drawn out of the wet sand, with a bunch of roots, without injuring a single fibre. The best time to commence operations for growing specimen Verbenas in pots is February, or as soon as vegetation commences for the season. It is desirable to pot a few of the best autumn-struck plants for the sake of early bloom; but they never make such handsome specimens, nor continue so long in good health, as plants raised from cuttings in spring. As soon as the cuttings are well rooted, they should be potted into 3-inch pots, and placed in a gentle heat for a few days, until they are established in the pots; then top them, and harden them by degrees; never allow them to remain long in heat after they begin to grow, or they will form long naked stems. As soon as the pots are filled with roots, shift into 6-inch ones, and from these into 11-inch pots. During the growth of the plant, all shoots must be stopped in order to cause the plants to grow bushy; and never allow them to flower until the plant is properly formed, and has as many leading shoots as are wanted. The compost in which I grow the Verbena is, equal parts turfy loam, leaf-mould, and peat, with a little silver-sand added, to keep the soil open. I water twice a-week with liquid manure, and occasionally syringe over head with clean water to cleanse the foliage. If the saving of the seed is no object, all flowers ought to be cut off as soon as they begin to decay. I need scarcely add, that the grand secret in the successful culture of this, as well as of all plants, is efficient drainage; without this no plant will continue long in good health. If green-fly should attack your plants, fumigate with tobacco; for if the fly once gets a-head, the plants will never recover sufficiently to give satisfaction. Mildew is another enemy which must be looked after. As soon as it is perceived, dust the plants with a little sulphur, which will stop it from doing much mischief. *Y.*

THE FUCHSIA.—In cultivating this useful flower, I begin by striking the cuttings about the end of this month, using silver-sand and leaf-mould for the purpose, and placing them in a close frame or pit where there is a little bottom-heat. When the sun shines, I shade for four or five hours during mid-day; and afterthe cuttings have been in for three or four days, I pull off the light for ten or twelve minutes every morning, in order to allow the confined air and damp to escape. As soon as they are rooted, I pot them off into 3-inch pots, in a mixture of equal parts silver-sand and leaf-mould. I prefer that mixture for the winter potting, for, being light and porous, it allows the water to pass off quickly. When potted off, they are replaced in the frame or pit; and as soon as they become established, I remove them to a warm and shady part of the greenhouse; after hardening there for a week or two, they are moved to a more airy part of the house, where they remain until January, when they receive a little artificial heat, say from 40° to 50° during day, and from 40° to 45° during night. When the roots make a fresh start, I shift them, some into 5-inch pots, and some into a size larger, according to the strength of the plants, using a mixture of equal parts silver-sand, turfy peat, and leaf-mould. In February they should have from 50° to 60° of heat during the daytime, and from 40° to 50° during night. As the day lengthens, I increase the day temperature to from 60° to 70°, the night heat being about 5° less, maintaining a moist atmosphere at all times, with air both day and night when convenient. The plants should be kept as near the glass as possible, and should be shaded during bright sunshine. If they do well, they will require shifting about once in five or six weeks; and before the operation, the mould about the roots should be rather dry than wet. After they are shifted, give a good watering, and replace them in their old situation, keeping them close for a day or two. In shifting, be careful not to break the ball; for if that is done, it is a long time before the plants recover, and then it is ten to one if ever they make fine specimens. In potting, I drain well, and place some moss (*sphagnum*) over the crocks, then some of the roughest of the compost, which (after the January shift) consists of one part silver-sand, two parts turfy or fibry peat, and one part dry cow-dung, all well mixed together with the spade, and used without sifting. When I resided near London, I used mould from Wimbledon Common with as good success as the above mixture, but as yet I have found no such mould to equal that in this locality. As the season advances, I pot rather firmly; and I find it a very good plan to put some of the moss on the top of the soil; when potted, the roots seem quite at home in it, and it prevents the mould from being washed over the pot. I use rain-water both for the soil and for sprinkling the plants overhead with. In the latter operation I am guided by the weather, and in the former by the wants of the plant. I also water about once a week with manure-water not over strong. I train on the single-stem system, allowing them to branch out right and left, never pinching the side-shoots back, except when one seems to take the lead of the others. By following these directions, I am certain that every success will attend your labours. *J. M. P.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—We shall soon have short, sunless, damp days and long nights, therefore look over the stock of pot-plants here, and see that none of them are suffering for want of pot room or other attention necessary to assist them to make young wood for flowering next season. Also see that proper care is afforded any late growing plant in the borders, for while in active growth much more water will be necessary, and insects will be much more troublesome than in the case of plants that have completed their growth. A slight sprinkling overhead should be afforded such as have yet to make their season's growth. Look very carefully after the Luculias, and keep them clear of their great enemy black thrips, giving them plenty of water at the root, and an occasional supply of weak clear manure water to old plants that may not be growing freely until they have made plenty of wood to ensure a grand display of flower; but manure water should not be given to young specimens in vigorous health, as it is apt to induce a too gross habit, in which state they seldom flower profusely. These are amongst the most splendid and useful of our conservatory plants, and well deserving of every care and attention, and when planted in the open border it is also one of the easiest to manage. To secure fine heads of bloom, however, the plants should be afforded a comparative rest of a few weeks after about the middle of next month, keeping the roots rather dry, and exposing the plants as freely to air as can be done without injuring the foliage or the adjacent specimens. Brugmansia sanguinea is also a very useful plant for winter and early spring flowering when managed so as to have it pruned, rested, and starting into growth about this time. See that large old specimens of Camellias are not allowed to get too dry at the root after they have set their buds, for this is what generally causes them to drop their buds, about which we hear so many complaints. Young vigorous plants, however, frequently require to be watered rather sparingly at this period, to prevent their making a second growth. Cinerarias for early flowering should also be growing freely; attend to these with shifting, &c., as may be necessary; for if they are to form large specimens for flowering in winter, they must not be allowed to sustain any check after this time; also take off suckers, and pot for spring flowering as they can be obtained. Calceolarias will now demand attention; get cuttings of favourite sorts rooted as soon as possible, and sow seed at once. STOVE.—Many of the hard wooded spring flowering specimens, when kept growing late in autumn, when there is not sufficient sunshine to properly ripen the wood, seldom flower strongly, therefore give every encouragement to such as have not made their growth, and use the shading very sparingly here after this time. The twiners here will now be in their glory; keep them well supplied with water at the root, and give frequent attention to regulating the shoots and disposing the blooms in the most effective manner. The Allamandas are fine plants for pot culture, but to have them in perfection they must be planted out in the border of the stove and trained to the pillars or back wall, where they flower magnificently during a great part of the year. The brilliant Clerodendron splendens, the Combretums, Echites splendens, Stephanotis floribunda, and many other first-rate things, do splendidly when treated in the same manner and trained near the glass.

FORCING DEPARTMENT.

PINERY.—The plants expected to afford the winter and spring supply of fruit must be treated with great judgment and care, in order to make sure of their showing at the proper time. Continue to select the most promising plants, marking them, to be sparingly supplied with water, to effectually check growth and induce a comparative state of rest for a few weeks. And those that have properly matured their growth, if wanted to show fruit at once, should be kept warm, giving them a brisk bottom-heat, and properly moistening the soil about their roots. Plants for fruiting late in spring, if not considered sufficiently strong, may be encouraged to grow rapidly for some time yet, as these will be sufficiently early if they can be got to show in November. Look carefully to those swelling their fruit, and keep them properly supplied with water at the root, using manure water in a clear not over strong state. Recently potted stock, especially those that were much pot-bound before being shifted, will also require to be watered with care, to prevent the ball getting too dry or soddening the new soil, for in either case the plants would probably be so checked as to cause them to show fruit. Keep all growing stock warm and moist, syringing them lightly twice a day, and shutting the ventilators early on the afternoons of bright days, allowing the temperature to rise to 90° or 95°, but give air freely in the forenoon and early in the morning, if there is any tendency to weakly growth, which, however, will not be the case if all is right at the roots, and the plants allowed plenty of room and light. VINERIES.—In the early house the wood will probably be well ripened, and the foliage turning brown; and where this is the case, houses that require painting or other repairs should be attended to at once, as the lights can be partly or wholly removed without injury to the Vines. Use gentle fires, and give plenty of air where the fruit is colouring, and in cloudy damp weather a little fire heat will be very beneficial in houses where the fruit is swelling. Where the fruit is ripe, and expected to hang for some time, the outside borders should be covered with something to throw off heavy falls of rain, as, with a continuance of cold sunless weather (of which we have this season already had so much that we hardly expect anything better during the autumn), the fruit will be very liable to damp off. The necessity for covering the borders at present will, however, greatly depend upon the nature of the soil; for, if this is light and porous, the water will drain through it rapidly, and there will be no danger of such being injured by moderate falls of rain; but where the soil is of a strong adhesive nature, it will be impossible, by the utmost care in keeping the internal atmosphere dry, to keep ripe Grapes for any length of time without great loss.

FLOWER GARDEN AND SHRUBBERIES.

Propagation of the stock for next season should be commenced at once, and gone about with expedition, so as to secure a lot of strong, well-established plants before winter, and without the necessity of keeping them so close or warm as to induce weakly growth and a watery habit. To be able to winter bedding stock safely with ordinary care, the cuttings should be put in sufficiently early in the autumn to allow of having them well established and fit to be exposed to the open air by the end of next month. Begin with such as are found to be the most tedious to propagate and prepare for winter. Hollyhocks are very general favourites, but do not afford cuttings freely, and are by no means over plentiful about most places. These should be examined often for any cuttings which they may afford, as those rooted about this time will make fine strong plants for next season. Attend to the tying of these and Dahlias, &c., and go over the masses of Verbenas, &c., frequently, for the purpose of regulating the growth and preserving order and neatness. Get Ten-week or Intermediate Stocks for spring flowering sown at once, also transplant Brompton and Queen Stocks, and if the situations in which they are to flower are not at liberty, prick them out in nursery beds, allowing them plenty of space to prevent weakly growth.

FLORISTS' FLOWERS.

Proceed with all expedition to layer Carnations and Picotees. Remove decayed petals from those pods in which seed is formed. Plant out seedlings in beds, where they may stand through the winter for blooming. Plant out Pink pipings on rich well-prepared beds. The amateur must recollect that if he wants fine well-laced flowers, that they must be planted and well established before autumn. Water Dahlias; at this season they require a good deal. Earwigs are very troublesome, and must be well looked after. Hollyhocks will also need considerable care. Pull up all worthless seedlings as they bloom; shorten the spike of those which are most promising, and thin out the flowers if overcrowded. Auriculas and Polyanthuses in pots must not be forgotten amid the many demands on the amateur's attention at this season. Keeping in a shady place, and clear of dead leaves and weeds, will be sufficient.

HARDY FRUIT AND KITCHEN GARDEN.

Winter Onions should be sown at once, also Cauliflowers for the early crop next season, a small bed of pickling Cabbage, Brown Cos., and some hardier sorts of Lettuce to stand the winter. The tops of the main crop of Onions had better be laid down, if they are inclined to be too rank, going over the bed with a wooden-headed rake, and pressing the tops down sufficiently to check further growth. Plant out a good breadth of Endive on well enriched soil of a light dry nature, also see to providing a good supply of Lettuce, &c., for autumn use. Attend to Celery, keeping it well supplied wit water in dry weather, giving it as much manure-water as can be spared for it, and keep the early crop rather closely earthed up. Vacant ground, or that which can be cleared of early crops, may still be planted with winter stuff, first giving it a good dressing of manure and a good deep digging. Stir the surface of the soil among growing crops. Cut Box edgings, and keep every corner clean and neat.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 10, 1854, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 18th, 1842—therm. 92 deg.; and the lowest on the 13th, 1839—therm. 32 deg.

Notices to Correspondents.

BOOKS: *T J C.* The last edition either of "Donn's Catalogue" or "Loudon's Hortus Britannicus," will doubtless answer your purpose.‡

CONIFERS: *M B.* Pinus insignis will probably not be found sufficiently hardy to withstand the winter in the situation you mention.‡

FRIGI DOMO: *An Old Sub.* We do not know that any one has asserted that this substance will keep frost out of a cold pit. If such a statement is current it is a monstrous exaggeration. The material is good, and we expect economical in the long run, and it will protect rather more than Russia mats. That is all.

NAMES OF PLANTS: *A R.* Calystegia pubescens.—*Erzeroum.* 400 Campanula glomerata; 543 Phyteuma lanceolatum (?); 970 Specularia falcata: 409 Phyteuma near lobelioides.—*Y Z.* It is Scutellaria macrantha, a very fine plant, but not new.—*Santo Domingo.* Epidendrum cochleatum and an indeterminable plant, of whose name we have no idea. No seeds of any importance have come up. The Mirabilis and Amaryllis have arrived; the Echites is reported dead.—*C W S.* Of a specimen so broken we can only say that there is no apparent reason why it should not be F. elatior.

PEACHES: *J. M'P., Renfrewshire.* It appears from your statement respecting the size of the flowers of your Peach trees, and from the specimens of their leaves, which we have received in good condition, that you have the Royal George, the flowers of which are small, the leaves serrated and without glands. The other, which you had for the Noblesse, is certainly not that sort, for the flowers, you say, are large, and the leaves, we see, are *crenated*, with *globose glands;* whereas the leaves of the Noblesse are *serrated* and *glandless.* Of the varieties of Peaches in general cultivation, the sort in question must be either the Acton Scot or the Grosse Mignonne, most probably the latter; but from the condition of the specimens of the fruit when received, we cannot determine nearer with such absolute certainty as we can affirm, from an inspection of the leaves you sent, that you have two perfectly distinct sorts of Peaches.‖

RATS: *T B S.* Try what effect phosphoric rat poison has on them; or an overbalancing board over a deep glazed pot of water, baited, of course, on the end above the water, into which the rats are precipitated while in the act of going for the bait, makes a good trap for them.‡

SKELETON LEAVES: *J M.* Steep them for weeks in rain water in a warm place, freely exposed to air; when nearly ready add a small quantity of muriatic acid to it. A great deal of care is, however, required in picking out, with needles, the parts of the leaves that are not rotted away.‡

STRAWBERRIES: *Berkeley Hill.* We never recommend dealers. Any respectable nurseryman can supply the Elton Pine if he chooses.‡

SULPHUR: *S.* The offensive smell will leave the pipes after a time, but they ought not to have been made so hot.‡

UPPER PERUVIAN GUANO ON SALE.—Apply to W. & J. RAVENSCROFT & Co., Liverpool.

Extract from a Report of Dr. Ure, F.R.S., &c.

"Your Upper Peruvian Guano is worthy of all commendation."

Extract from the Report of George Longton, Esq.

"RAVENSCROFT'S Upper Peruvian Guano will last longer, and eventually do more good than Gibbs', or any other I have ever tried. It possesses the very finest qualities of both Guano and Bone Dust."

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodoriser and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of STOCK and DOMESTIC POULTRY will be held in BINGLEY HALL, on the 12th, 13th, 14th, and 15th of December next. The PRIZE LISTS, and any further information, may be obtained from JOHN MORGAN, Jun., Secretary.
Offices—38, Bennett's Hill, Birmingham.

The Agricultural Gazette.

SATURDAY, AUGUST 12, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, August 13—Agricultural Imp. Society of Ireland.

NOTHING could be more appropriate than the terms in which the Earl of CHICHESTER introduced the French deputation at Lincoln, unless it was the hearty and hospitable manner in which they were received. It is of the greatest importance, as his lordship observed, that the neighbouring countries should be on good terms, not only nationally, but professionally — that not only as men but as farmers we should be prepared to shake hands with the French. Self-interest, if there were no higher motive, is sufficient to induce this—for the principles of agriculture are the same in both countries, and their results are in many districts of both sufficiently alike to furnish lessons equally useful on both sides of the channel. We hope, therefore, that the cheers which greeted the members of the French deputation were the real expression of a feeling which will exhibit itself in a more substantial manner whenever opportunity is afforded.

Such an opportunity offers itself at present. Prof. WILSON informs us that he has been commissioned by the Board of Trade to secure the fullest possible representation of the agricultural produce of the country for the Paris exhibition next year. We believe he will find no difficulty in the accomplishment of his task—that he will receive offers of assistance from a sufficient number of intelligent occupiers of land in every county to ensure this full exhibition of British agricultural results.

The following is a portion of the letter on the subject with which he has favoured us:—

"I wish to have the finest specimens that can be procured of *all our crops*, both in the *sheaf* and in the grain, with information as to exact varieties; locality where grown; mode of cultivation; seed sown; produce, &c. The sheaves should be about 4 inches in diameter; and the samples of seed 1 peck each. It is most desirable that the samples should be carefully selected, and as I probably shall have many duplicates sent, I must, of course, reserve the right to select those I think most suitable for the purpose. In all cases the name of the grower will be given. Samples of wools, too, I would gladly receive (as animal produce); of these the display would be restricted to specimen fleeces of each of our *different distinct breeds* and to *known crosses* of them. I need hardly add that in all cases I am prepared to pay the market value of them."

We add that the sheaves should be packed in mouse-proof boxes, as then they will not be touched until they arrive in Paris. We hope that some of the readers of this paragraph will be induced immediately to put themselves in communication with Professor WILSON, Marlborough House, Pall Mall, on this subject.

WE have just received specimens of white Wheat from King's County, the ears of which are densely covered with red rust, a disease which is said to be very prevalent and destructive in parts of Ireland. Our attention was more especially called to the loathsome smell of the specimens, a circumstance which surprised us much before examination, as the parasites with orange-coloured spores, when they possess any odour at all, diffuse one very closely resembling that of Orris root, an odour which accompanies many Cryptogams of a similar colour, as the yellow Byssus, Chroolepus odoratus, Æcidium Caladii, &c. An inspection of the ears, however, at once solved the difficulty, for the "antient and fish-like smell" was clearly due not to the rust, but to unmistakeable bunt, every grain of the ears being infested with that fungus, and having already acquired nearly its full dimensions. The matter is worth recording, first, because it shows how necessary it is to examine properly before jumping to any conclusion; and secondly, because the bunt has been perfectly developed, though the spikelets are affected with rust to a degree which we scarcely ever observed before. A hasty judgment might attribute the evil to rust, a complaint which the farmer at present cannot contend against, whereas it is really due to bunt, which ought not to make its appearance in any prejudicial quantity on well cultivated land. Rust is never, we believe, very injurious in this country, except to white Wheat; and even when the spikelets were strongly affected we have often seen the grains perfected. The one parasite has in the present instance not prevented the development of the grain, though infested from its earliest infancy by another and more inveterate foe, and though the development of such thousands of spores must require vital energies at least as strong as those which would otherwise have deposited fecula in the cells of the healthy tissue. *M. J. B.*

WE have recently visited a village secluded among the richly-wooded scenery of Northamptonshire, which, though remote from the traffic of railway or turnpike, and approachable only by lanes and open fields with their innumerable gates, through the corn lands and moist pastures of the oolite hills, has not shut out the spirit of progress and enlightenment; but forms one of those rare examples so attractive alike to the genial thinker and the earnest philanthropist; for at LOIS-WEEDON the same liberal intelligence which, conversing with Nature in this quiet retirement—like NUMA with EGERIA—has won some of her choicest secrets, is also moving with generous activity to lighten the pressure of poverty upon those that toil, and to infuse thought, feeling, taste, and virtue into this little community of young and old.

Hence, in spite of the anti-intellectual, anti-moralising influence of "three packs of fox-hounds and six 'meets' a week," we find there the schoolhouse, with its orderly crowd of rustic youngsters learning how to fund knowledge by means of book, slate, and pen, and joining their voices, too, in harmonious part-singing that must completely unfit them for bird-scaring in future. There, too, is the school garden, where the master refreshes himself from his duties, and watches with evident relish his own successful plot of Wheat in the three-row culture. There we inspected with pleasure a spacious area of labourers' allotments, with corn, Potatoes, and all manner of table vegetables thickly covering the ground—crops that will well repay the toil and replenish the winter meals of the industrious families for their skilful tillage. There also we found existing that credit of agricultural work-people, a thriving benefit society, meeting by the mutual consent of its members at a house where no exhilarating beverages entice to drunkenness. All these things add a charm to the place where the great principles of cultivation discovered to the profound insight of JETHRO TULL are now being practically expounded with the aid of modern scientific researches.

The object of our visit was to view the growing crops cultivated on Mr. SMITH'S system; and for the information of those of our readers who have not yet enjoyed the same treat, we will endeavour to say in a few words what we saw, and what was the lesson we gathered from the sight. A whole farm has not been devoted to the row culture; nor on the other hand has the mere corner of a garden bed been selected for its trial; but several acres have sustained this wonderful species of farming—without manure, and without rotation—for a considerable number of years. Thus, no allowances need be made for the difference between gardens and fields, in estimating the probable returns upon a larger scale; the acreage and the produce in any case will be multiples of the same quantities given by Lois-Weedon. The method is so well known, that, of course, we shall not now recur to its peculiarities; but merely report the palpable evidences of its success. We saw two crops of "PAYNE'S Defiance" Wheat (this sort being chosen as proof against the ravages of the village birds), both very healthy and promising; one a good crop though not standing on a real Wheat soil, but upon light land covering a yellow oolite gravel; the other a great crop, with amazingly stout strong straw and well loaded ears, the soil being clayey, with small stones intermixed, resting upon a subsoil of yellow clay. When this latter field was first double-dug the old fertile staple being thus buried, and the "nasty stuff" thrown out over all the surface, every farmer and labourer that saw it declared that Mr. SMITH would never get another good crop as long as he lived; but now beholding a magnificent yield upon that surface, what do they say? "No wonder Mr. SMITH has such fine crops, his land is so good!" The amazing size of the ears, and the strength of the long stems which preserve a perfectly upright position, although so heavily laden, astonish every visitor. Indeed, the rows present the appearance of having an immense number of stalks; though, upon counting, we find that it is not so much the great number as the thickness of each one that swells out into such a bulky crop. Taking a length of 2 feet along three rows, we counted 153 stems, equal to 25½ per lineal foot in one drill: an extraordinary heavy crop, drilled at 9 inches apart, which we counted for comparison, gave 28½ stems per foot along a single drill; and another crop drilled at the same distance, and promising 40 bushels per acre, gave only 17½ per foot. Mr. SMITH has generally obtained 36 bushels per acre, and the present crop, though the *eleventh* annually without manure, is the best he has had, so that we may estimate it at 40 bushels per acre. Comparing this with the crop just referred to, we find that 28½ stems of the three-row Wheat produce as much corn as 39 of the common crop. Mr. SMITH'S crop was very thinly seeded. Only 1 *peck* per acre was drilled in rows, which average 20 inches apart over the whole surface; and taking the usual calculation of 650,000 grains in a bushel, we have 30½ grains for every lineal foot of drill: the crop grown in the common manner, drilled at 9 inches with 8 pecks of seed, has 110¼ grains in the same length,—nearly quadruple the thickness of the other, though the number of stems from all this seed is not one-half greater. However erroneous may be this assumed number of grains in a bushel, the fact still remains that a vastly greater proportion of the grains are developed into plants by the new than by the old system.

As Mr. SMITH annually reaps a good crop of straw as well as corn, without returning a particle of it, or any manure whatever to the soil, he is enabled to manure highly another part of his land for green crops. These are cultivated in yearly succession without any rotation, upon ridges 5 feet wide; Carrots in double rows, but Swedes, Cabbages, and Winter Beans in single rows, one row upon each ridge. The Cabbages are of enormous size and weight; the Swedes are very fine and forward already, and, if they prosper as in other years, will spread their leaves for 5 feet in width; while the bulbs will swell to more than a foot in diameter, still preserving their soundness and fine quality of flesh. Common Turnips would not be likely to answer upon this plan. The Winter Beans, though very thinly dibbled in single rows, are very thick and branching, so that they will probably touch each other over their 5 feet intervals, without falling upon the ground; and the stalks are so podded that there are from 30 to 40 and even 50 upon each one. Single rows of Globe Mangold have also been stolen upon the intervals which will be occupied next year by Beans. The fact is, Mr. SMITH has not to say "What crop will this ground bear?" but "what crop do I want?" By his system, any crop or succession of cropping can be produced without respect to rotation: is not this, indeed, agriculture in a normal state?

As an instance of what farmers call scientific

knowledge triumphing over practical or routine experience, we may mention that Mr. SMITH is growing Lucerne very successfully, although all the local cultivators assured him that this plant inevitably failed there after a few seasons. The voice of the long-gathered experience and observation of any district ought never to be disregarded without good reason; however, Mr. SMITH took a number of young Lucerne plants, *cut off their tap roots*, and set them out like Cabbages. These plants, it is said, do not again send down their tap roots into the noxious subsoil which injures them, but continually spread out their lateral roots, which, by manuring and stirring the land, can be perpetually fed.

In conclusion, we would entreat all enterprising farmers of good Wheat soil, to give the new system an immediate trial; or at least, if manual labour be too scarce for digging, attempt a few acres on the following plan. Take a plot of *sufficiently exhausted* land (otherwise you will fail)—say a Wheat stubble—clean and level it; lay out in lands or stetches about 7½ feet wide; with a common drill sow upon the crown of each land four rows of Wheat, at 12 inches apart; sow thinly, and be sure *sow early*, so as to escape mildew. When the Wheat is up, plough the intervals at full depth, having the horses in length, and taking one bout to each interval—or, perhaps, one furrow more—so as to leave some 4 inches on each side to protect the Wheat; then, with a BENTALL's or COLEMAN's cultivator, a horse-hoe, &c., you may till and *pulverise thoroughly* throughout the spring and summer; keep the *land very clean* by horse and hand-hoeing; earth up the Wheat rows just before flowering time, as you would Potatoes, and when harvest is over, pare and clean, or burn the stubble spaces; *plough the entire plot two furrows deep;* and then lay out in lands as before, taking care to have the Wheat rows where the intervals had previously been. Your four rows of Wheat will be pretty equal in bulk, and not thin inside; for Mr. SMITH's middle rows fully equal, if not surpass, the outside ones; but we would not advise to try more than four, which will just be sufficient to cover the smallest interval you can efficiently plough.

The experiment is simple; the cost moderately easy; the object well worth realising. Are we to leave the Weedon husbandry for future historians, and it may be poets, to lavish praise upon? Shall we let our generation lazily bequeath its profits to posterity? *I. A. C.*

IN pursuing our remarks on STEAM CULTIVATORS, we come to describe in general terms the machine introduced to the public by that friend of agricultural progress, Mr. MECHI, and invented by Mr. ROMAINE, of Montreal. It consists of a common box cart, riding upon two wheels, with broad tires, about 5 feet in diameter, drawn by two horses. Immediately in front of the axle is placed an upright tubular boiler and engine; from the axle of the cart, and outside the wheels, is suspended a framework extending about 6 feet backwards, to the extremity of which is hung a revolving cylinder, carrying a series of 200 steel-pointed picks or knives. This framework is partly supported by two small carriage wheels, and can be raised or depressed, like the levers of a drill, by means of a screw apparatus. Motion is communicated to the cutting cylinder (which, with a 20-horse power engine, is to have a speed of some 240 revolutions per minute) by a shaft extending back from the engine, driving by means of mitre-wheels another shaft fixed immediately over the cylinder and parallel to its axis. A spur-wheel of about 2 feet diameter upon the middle of this transverse shaft gears into another of 1 foot diameter upon the axis of the cylinder, which it thus divides into two equal parts. By this arrangement the framework, cylinder, and gearing can all rise or sink together, without interfering with the action of the wheel-work. The cylinder, consisting of a cage frame of discs and bars, something like the beaters of a threshing machine, about 6 feet long, carries prongs or cutters which describe circles of about 2½ feet diameter; and the depth to which these can work in the ground we should think must be limited by the spur-wheel on the middle of the axis coming in contact with the uncut strip left underneath it—this allowing a depth of about 9 inches.

Immediately behind, and over the cylinder, is attached a box acting as a leveller to the pulverised earth; and a small roller following this box gives motion to a small brush seed-sower fixed within it. By removing the cylinder and levelling and sowing apparatus, a reaping or mowing platform may be attached; the cart, of course, being pushed, as it were, backwards by the horses, instead of being drawn forward. In this part of the invention there is an ingenious arrangement of spring arms, which, collecting the cut cropping into bundles or armfuls, releases these at intervals, to be bound into sheaves by men stationed upon the platform. Not having had an opportunity of personally examining this machine, or heard any testimony as to the character of its work, we must stay our pen from criticism, contenting ourselves with the above very general description, and patiently waiting for experimental information from its patron Mr. MECHI.

The form of machine which we regard as ultimately destined to supersede all such as we have yet mentioned—namely, a self-propelling locomotive engine of the lightest possible weight, running with broad wheels upon unmoved ground, and tilling, by means of a rotating cylindrical rasp or cutting tool affixed behind—has appeared in but one or two instances at present.

"USHER's Steam-plough," consisting of a locomotive engine mounted upon rollers, and driving a shaft carrying 12 curved plough bodies and coulters, certainly comes under this denomination. It was shown in model at the Great Exhibition, has been manufactured and fully tried last year near Edinburgh; and subscriptions have been raised in 10*l.* shares for experimenting with one of lighter and improved make. This implement neither grubs nor digs nor ploughs; but leaves the soil in flakes or small broken pieces, and performs its work at a cost of about 3*s.* per acre. Then there is Mr. GUTHRIE's invention, by which forks arranged about a steam-driven axis are so moved by mechanism as to till the land by regular digging, the blades being forced into the ground and turned over, so as completely to reverse the earth on coming out again; this belongs also to the same class. The axle is to revolve only 50 or 60 times per minute, and to advance two-thirds or three-fourths of a mile per hour. Sir JOHN FORBES, in describing this clever machine to the Fettercairn Farmers' Club, states that it has been a long time in model, though never yet in actual operation, from want of means and encouragement. It is not only a matter of great regret, but of general loss, when promising inventions are suffered to perish in embryo; and, indeed, there is sometimes even the cruelty of letting the inventors themselves die for lack of proper feeding, like some birds in the very act of sitting. No doubt there are many unhatched ideas of a steam cultivator, which some moneyed CANTELO might develope into existence. Looking at the patents of the past year, we find three inventions of the kind to which we are now alluding, One is by Mr. HOSKYNS, consisting of a frame carrying a steam boiler, mounted upon broad ribbed rollers, and having a rasp behind, which can be set to different depths by screw. Two horizontal steam cylinders work a shaft having two drums or riggers, one on each side the machine; and these have endless chains passing round smaller riggers on both ends of the rasp or tiller. The onward motion of the whole is obtained by means of wheel-work from a worm on the engine-shaft, gearing with the axle of the carriage-wheels or rollers. The rasp consists of a number of discs fast upon a spindle, each carrying two chisel-pointed cutters at opposite diameters—there being a sufficient number of cutters to occupy the entire breadth of the work. The engine is proposed to make about 60, and the rasp 120 revolutions per minute, each tooth taking a half-inch bite.

Another design is by Mons. A. DUSSUC, in which the rasp is driven by a spur wheel at one end, having a second wheel between this and a much larger one upon the axle of the carriage-wheels, which is turned directly by the engine. The peculiarity of the rasp is that a very great number of thin, heart-shaped shares or trowels are set by short stems upon the surface of a cylinder; these cutters not standing out radially, or curved at any angle, but lying flat, nearly concentric with the surface of the cylinder. Instead of cutting down in front and throwing out behind, these cutters, moving with great velocity, seem intended merely to pass clean through the soil, leaving it uninverted, but minutely subdivided and pulverised. The last invention is one patented in November 1853, by PATRICK KELLY. The rasp—a cylinder armed with bent prongs—is driven with an intermediate multiplying motion from a large wheel upon the carriage-wheel axle; and this large wheel is turned by a pinion upon the crank-shaft of the engine. The rasp seems intended to make about one revolution to every stroke of the engine, while the carriage travels forward at a comparatively slow pace.

Many other proposals may be forthcoming. If this class of inventions has been hitherto so miserably lacking in practical trial and experiment, so that single individuals are afraid to venture a full-grown machine—as in other branches of mechanical ingenuity having more data for calculating results—can there not be found a number of 10*l.* shareholders, like those in spirited North Britain, to give working demonstration to some promising steam-cultivator? *I. A. C.*

THE DORKING FOWL.

THE Dorking fowl being the most suitable for the farm-yard, we purpose giving a few hints to those who are desirous of keeping it, and also a few remarks on its management. The chief characteristics of this breed are a square body, broad breast, white legs, and five perfect claws on each foot—colour varies; we have the coloured, comprising the speckled, red, grey, and cuckoo Dorking, and the white; in the latter variety the comb must be double, but in the others it is a matter of taste, although the single combed birds are generally preferred. The red Dorking is equally as large as the speckled or grey, but as it is not in such general repute, does not attract so much attention; in fact, we are inclined to consider it not so highly appreciated as it deserves. The fact that red chickens are frequently bred from grey parents is a sufficient proof that the two varieties are of the same family. The cuckoo Dorking is, to our eye, a more common looking variety, which may account for the small share of public favour it in general experiences at the poultry shows. The weight of the speckled Dorking cock varies from 7 to 10 lbs.; an 8 lb. bird is never to be despised; the hen weighs from 6 to 8 lbs. The white Dorking is a smaller and more delicate fowl, and therefore we consider not so great an acquisition as the larger varieties; however, its neatness and pure white plumage excite many admirers. Having selected our birds, the next thing to be considered is how to manage them. Five hens are about the number to be placed with one cock. We have known several good broods from a cock which ran with eight hens, but it is incurring a risk to allow more than six. If the hens be two years old and upwards, it will be advisable to use a one-year-old cock, or *vice versâ*, remembering that to introduce fresh blood every second, or at the most third year, is the great secret of retaining the size and beauty of our stock. To those who keep fowls chiefly for producing eggs, we do not recommend Dorkings, as in this respect they are far inferior to the Hamburgh class; but where the number of chickens is the object, they will not be surpassed, as the fact that the hen is very frequently "broody," is decidedly a "feather in her cap;" and should she be ever so strongly disposed to "sit," and it be inconvenient to "set" her, by confining her for two or three days (without trying the use of jalap or other still more barbarous means), she will soon cease to "cluck," and will very shortly recommence laying. Pullets hatched early in the spring will often lay in the autumn, but in general we must not expect many eggs before January or February; so much, however, does it depend on the state of the weather, that there is frequently a month, or even more, difference in the time of the hens being in full lay. This season very few of our Dorkings laid before March. Unless breeding for show, it is better not to set any eggs until March, as chickens hatched before that time require a great deal of extra nursing and care. From March until July is the best season; those hatched after never attain the size of earlier ones, and consequently are seldom selected for stock. During March and April we place 11 eggs under each hen; after then 13 or 15, according to the size of the bird. As soon as the chickens are hatched, it is advisable to place them in a coop, and keep the hen confined there during the first week, after which time we would allow her liberty during the middle of the day, gradually increasing her leave of absence. The best food for young chicks during this period is Wheat and a few groats, or a little Rice or Potato once every day. When they are from three to four weeks old, if the yard be given to that most troublesome and fatal disease called "gapes," symptoms of it will in all probability be apparent. "Delays are dangerous" at all times, particularly so now; immediately the cough and accompanying sound of "kick kick" are heard, a feather must be procured, and stripped, with the exception of a very little at the smaller end, dipped in turpentine, and thrust steadily down the windpipe of the chick; it must then be twisted about, and should the operator be desirous of assuring himself that he is successful, let him place the bird on a white sheet of paper or cloth, and if the windpipe be then pressed, the chances are a small red worm or worms will be coughed up; should this occur, he may in general consider the experiment has answered. The cause of the disease is not as yet known, for although many opinions have been expressed on this point, we consider them merely theoretical. If the disease but once get in a yard however, its reappearance may be expected for several succeeding years.

Having passed this stage, the chickens require very little care, and will, with the assistance of a meal a day, obtain a good subsistence in the farm-yard; neither should we anticipate the appearance of any disease until they have nearly reached maturity, when occasionally a few are lost from a disease somewhat like "decline," of which we have seldom effected a cure; the bird gradually wastes away, and however "monstrous," our attempts are generally abortive, for the bird is eventually found dead. Having now followed our Dorking through the various stages of chickenhood, we find it, although still fresh with the vigour and beauty of youth, yet not safe, for mature Dorkings are peculiarly liable to disease of the feet. "Bumble foot" is caused either by the weight of the body, the size of the claws, or frequently by high perches; a cure for this is rarely effected, therefore all that can be done is to prevent it, the means for which are obvious. Corns can be extracted with a penknife, but frequently lameness is caused by the extreme point of the fifth toe pressing upon the ground, inflammation is produced, the claw

rots out, and if not checked mortification ensues; amputation of the claw is now advisable, and, to prevent too great a loss of blood, we have found the application of a hot iron beneficial. During March poultry are frequently seen moping in corners; and on examination it will be found that the head is fearfully swollen to the size which is frequently denominated "swelled blind;" there is a discharge from the nostrils and a gurgling in the throat, commonly called by country dealers "rattles;" when this occurs confine the bird in a warm dry place, bathe its head with vinegar, and administer a tablespoonful of castor-oil, and it will in general be perfectly well in the course of three or four days. Roup may be treated in the same way, but is a more troublesome and lingering disease. When it is desirable to cross our birds, if we consider our own yard reaches the standard, for it frequently does happen that "we may go further and fare worse," it is better to change the male bird alone, get rid of old hens and substitute pullets, filling up all casualties with those bred at home, and which we know to be genuine. As we are not writing about "fancy" but on "profitable" poultry, we have said but little about the requisite feather and minor qualifications of Dorkings as "show" birds; but as poultry shows have done, and still are doing, a great deal towards developing the size and beauty of our farm-yard poultry, there is every reason why they should be encouraged; we will therefore mention that the chief points to be considered by those desirous of exhibiting, are size, colour, characteristics fully developed, and last, though not least, that a good match may be obtained, of whatsoever colour the birds may be, as uniformity of plumage is, in our opinion, of more consequence than colour itself. We have also omitted to say anything respecting the poultry-house, as a good one is generally to be found at the end of a warm ox-stall, with a thatched roof. It only remains for us now to advise the admirers of poultry to "leave well alone," by which we mean that he will find it more profitable in the end to be content with a fair market price for his poultry, than to seek exhibition prices, and at the same time remind him that "what is worth doing at all is worth doing well." *C. P.*

THE PIG.—No. III.

Having determined upon the adoption of a particular breed, the next point is the process of breeding and rearing. The boar and sow must both be selected with great care; they should be free from all natural defects. The sow should possess at least 12 teats, and she ought to give evidence of a capacious frame. Both boar and sow must be at least 10 months old, and may be put together in the months of April and October. The period of gestation extends over about 16 weeks, consequently the sow will farrow in the months of August and February. In the first case the litter will attain sufficient hardihood to brave the winter and obtain their living in the fold-yard; in the latter they will be able to gain their living by grazing, or amongst the roots in the fallowing fields. Sows are said to produce five litters in two years; but it will require close attention and good nursing to get off two good litters annually. The sow will take the boar soon after farrowing, but a reasonable time of rest ought to be allowed, to ensure her safety and future well-doing; thus with care she will retain her breeding powers in full profit for three years. During the period of gestation she should roam at pleasure with the herd; but a short time before farrowing she should be put into a convenient and roomy sty, and be fed with simple food. As her time approaches she should be closely watched, and her bed niggardly restricted, or her progeny would be endangered by smothering or the sow lying upon them. She must be well nursed at this period, and her food should consist of milk, warm wash, whey, or swill, mixed with bran or meal.

A good breeding sow will produce about 10 piglings at a time; but the casualties to which young pigs are exposed is very great, and much loss frequently occurs before weaning; they are usually castrated or spayed while suckling, and in about six weeks from birth; at from eight to ten weeks they may be weaned, when they should be fed with good farinaceous compounds, mixed with warm milk, whey, wash, &c., at least three times a day. In two or three weeks Potatoes or similar food may be given, and the warm feedings may be dispensed with, and cold ones of the same mixtures substituted, till they are strong enough to turn to the herd.

Management of the Pig.—When the piglings are weaned and turned to the general herd they are called young pigs or store pigs; it is to the management of these store pigs that I would now direct attention. The growing pig is usually a great gormandiser, and cannot profitably be fed upon millers' offal, bran, or indeed any similar food—it is too expensive; they must mainly be fed upon the refuse produce of the farm, such as garden stuff, weeds of all kinds, the refuse of the kitchen, the dairy, the barn, the fallowing field, or the fold-yard; these supplies, however, are wholly inadequate for the large herds of swine now very properly kept by every thrifty farmer; hence resort must be had to the ordinary artificial Grasses, *i. e.*, Lucerne, Sainfoin, Tares, Clover, Chicory, Rough Comfrey, Jerusalem Artichoke, and similar crops for the summer; and the Potato, Turnip, Mangold Wurzel, and similar crops for the winter. In the summer many herds are for several weeks sustained in the fallowing fields; they form excellent root weeders, of which they consume large quantities. It is easier to find suitable food in the summer for store pigs than in the winter; in the summer they will quietly graze in Grass, Clover, or fallow fields, or they may be confined in a paddock or large airy yard, and have their supplies of food brought to them; and this, followed by the run of the stubble fields after harvest, will usually put them in good condition for subsequent fattening. Besides this common and inexpensive mode of "summering" pigs, many others are adopted; one is to collect the green weeds growing on the farm, *i. e.*, nettles, thistles, and the like, boil them, and mix with the liquor a small quantity of bran or meal; this is a nutritious food, obtainable on most farms, but is too expensive for summer service; it is, however, very desirable to supply the herd with some such food, after every day's grazing; and if mixed with a proportionate quantity of meal, so as to form a corrective to the too succulent food of the day, will prove of great advantage. The preservation of a part of the last year's Mangold Wurzel, and a few given daily, is of similar benefit. The great supply, notwithstanding, of such artificial aids will be in the application of the crops named above. The Lucerne, Sainfoin, and Broad Clover, are excellent food; but Tares and pasture Grasses are too laxative and require the corrective just named. Chicory, Rough Comfrey, Jerusalem Artichokes, Cabbage, Coleseed, Lettuce, early Turnips, Mustard, Rhubarb, or the common Sow Thistle and the like, may all be grown with surprising advantage for this purpose, and are all relished by the pig. Many of these crops may be cut several times during the summer, and will produce large crops successively under good culture; these kinds of crops being cultivated properly, and in sufficient quantity, will provide nutritious food for any number of pigs; and if, in addition, the porridge named above is given in conjunction as a corrective, the herd will thrive in a highly satisfactory manner; and what is better, on a cheap, healthy, and almost inexhaustible supply of food. Shelters, and a good supply of water, both for drinking and wallowing in in hot weather, is necessary for the well-being of the herd, and the yards or paddocks should be very roomy, in order to promote the healthy development of the younger animals, and occasionally they should be altogether cleared, so that all may be well aired; the transfer to the fallow field or the stubble field gives fine opportunities for this requisite airing.

In winter all the pigs in a forward state ought to be put into the sties for fattening, but those still in a store state must remain in the fold-yards, and every endeavour should be made in an economical way to keep them progressing; for this purpose Mangold Wurzel, Turnips, Potatoes, Carrots, &c., should be supplied to them in moderate quantity, which, with the stray grains, &c., of the fold-yard, will keep them in fair condition till they arrive at proper age for fattening; this will vary with the breed or variety. The best period appears to be when they attain the age of about 20 months, for bacon, and a few months less for pork.

Store pigs cannot to any extent be profitably kept in sties; however beneficial it may be to every family to have a pig or two in the sty to consume the household refuse, it is equally certain that this cannot be beneficially done on a large scale. Sty-fed pigs ought to be animals which have attained a forward state of maturity, and therefore requiring more expensive food to promote their fattening. Growing pigs should have ordinary food and like treatment, till they are gradually prepared for fattening; and as they denote beneficial progress they ought to be pushed forward to maturity, then sold off, and others supply their place.

The fattening of pigs in our next.

Home Correspondence.

Offal of Fishing Villages.—Your remarks on preserving the offal of fish in fishing villages are directed to a subject which might be turned to very good account, and keeping attention to the subject may lead to a valuable return. A desire to contribute a mite toward furthering your object induces me to address you. The offal consists of moisture besides what it is desirable to preserve. Why not expose it thinly on blackened plates of iron to the summer's sun, with pounded shells, and when dry pack it in barrels? You will then have your manure in a concentrated form, to be diluted, moistened, or treated as may be best at the spot where it is required; one man to spread, turn, and mix with the shells during the fishing season could do a great deal; and by treating the offal at once in this way, the stench of its fermentation would be avoided; the labour of carrying diluents, which only add to the weight, and that to the expense of carriage, would be saved. *A Surgeon.*

Detection of Fraudulent Guano. — In your last (p. 494) is a proposal for burning off, as a test for the genuineness of guano. This may answer pretty generally for detection of the adulterations now practised, but if at all extensively adopted, the ingenuity of adulterators will be exerted to elude it, and unfortunately there are chemists as ready and skilful at adulteration as others at detection. Such summary methods of probation are like the private marks on bank notes, secure enough while kept secret, but no sooner made public than they are imitative, so that true chemical assay is the only thing to be permanently depended on. The fraudulent manufacture is now become so extensive that it may be questioned whether agriculture does not lose more by these frauds than it gains by the whole system of portable manures. Every farmers' club should now be a protection society, and where there are no clubs societies should be formed for protection expressly. A number of samples should be assayed every year by trustworthy chemists, at the expense of the societies, and the names of all detected adulterators should be published, with the cases of adulteration, in the agricultural papers generally, and in the local newspapers of the respective neighbourhoods, to drive them out of the market; as the imposture is too gainful to be given up while buyers can be deceived. *J. Prideaux.*

Foreign Correspondence.

Holstein, *July* 23.—Harvest is just begun. The Rye, now ripe, proves a very superior crop—large heavy ears and plenty of them—a more abundant produce generally than I have before seen. This is of material consequence as regards the British supply of continental grain, as three quarters of the population of the north and middle of Europe subsist chiefly upon Rye when it is sufficiently plentiful. The other crops in Holstein, and eastward in Mecklenburg and Pomerania, also promise well, Oats excepted, which will scarcely reach average. The Wheat here since the middle of this month, in consequence of a moist and sultry atmosphere for several days, has however been attacked by rust, which may injure it to some extent; but the dry weather which followed last week, it is to be hoped, has checked the disease. In the vicinity of Lubeck, where the rust prevailed generally, one field sown with seed from Scotland was quite exempt from rust. The Potato fields also look well—the drills not discernible, and the field light blue at a little distance, from the exuberance of blossom, an index of health not of late years much seen. In the vicinity of towns, where much nitrogenous manure had been given, and the ground clayey and damp, circumscribed spots appeared of the Potato disease about 10 days ago, in the fields as well as in the gardens. This took place after several days of showery sultry weather with thunder. But during last week of dry weather the disease did not seem to extend. Well out into the country, upon the drier land, the disease has not appeared, and the Potato crop is fast maturing, being already further advanced than when stopped in growth last season by the disease. If not checked within two or three weeks, the Potato will equal the Rye and Barley in abundant produce, and cause low prices of food in Germany during the coming year. From the drier soil and atmosphere and colder winter of Germany, the tubers of the Potato, once formed, are not so subject to rot from the disease, whether in the ground or in the store pit, as they are in Britain. During the latter part of last week the weather in Holstein has been unprecedentedly hot, the temperature of the air sometimes exceeding blood heat, and strokes of the sun occurring. One of the seamen on board a British steamer was on Saturday struck down on the deck, while the vessel lay in the Elbe, at Hamburgh, and was only recovered by bleeding, the application of ice to the head, and other medical aid persisted in for several hours. Notwithstanding the greatly increased taxation and contributions levied on the Duchies by the Danish Government since the war, Holstein and Schleswig are rapidly improving in agriculture—in grain and cattle raising, in butter making, in roads, houses, and in whatever concerns human advancement under present circumstances. This is one of the happy results of the English free trade in food, and consequent great intercourse with England. The Holstein butter now rivals that of Holland, and is sold in Britain as Dutch. The making of butter and cheese is here pursued as a separate trade. The milk of a number of farms is bought by the butterman at so much per cow, and the art of butter and cheese making being thus carried on as an especial business, hence receiving the undivided attention of those so engaged, advances nearer to perfection. It is a pity that the Danish Government does not second Britain in these free-trade measures and ameliorations of tariff, by which Denmark and the Duchies profit so much, and might profit a great deal more. But Denmark, notwithstanding that Britain is the chief source of her prosperity and wealth, is inimical to Britain and favours Russia, while in the Duchies quite a contrary feeling prevails. *R. Johnston.*

Societies.

ROYAL AGRICULTURAL IMPROVEMENT OF IRELAND.

Armagh, *August* 9.—A journey through the East of Scotland unfits one for a fair judgment of Irish agriculture. The high polish on Scottish farming makes the negligence of the Irish agriculturist appear more glaring than it actually is. It needs the memory of the same district during the past 10 years to make the journey between Belfast and Armagh gratifying to an agricultural eye. Compared with itself in the past it is no doubt satisfactory enough, while compared with the Lothians in the present it presents a sufficiently disheartening contrast. We are surprised to find little of the Flax crop in this part of the country, and that so late when compared with what we saw some weeks ago in Lincolnshire. The Potatoes seem everywhere attacked with the disease, and the grain crops are very far from good.

The show yard at Armagh indicates life enough in the Society; it, and that within it, presents a very favourable contrast with our remembrance of a similar meeting some years ago in Dublin. The show of short-horns is larger than any we have seen this year; and though it contains many animals below the standard of those

shown at Lincoln, yet most of the prize animals of Lincoln, Ripon, and Berwick are here.

At Lincoln 56 in the bull classes of short-horns, and 55 in the cow classes were exhibited. At Berwick the numbers were 52 and 46 respectively. At Armagh they are 61 and 90. Here, however, the superiority ceases; the other breeds, whether English, Scotch, or Irish, are very imperfectly represented. Devons and Herefords are hardly here at all, and Ayrshire and Kerry both make a very poor show.

There is a very good show of Leicester sheep, and a fair collection of horses, chiefly of the Clydesdale breed.

The following is the list of awards in Short-horns and in horses. The others had not been announced when post left:—

CATTLE.

SHORT-HORNS.—1. *Bulls calved between Jan.* 1, 1849, *and Jan.* 1, 1852: 1st, and Council Gold Medal, to R. Booth, Warlaby; 2d, Sir A. B. Brooke, Brookborough.

2. *Bulls calved in* 1852: 1st, C. Towneley, Towneley Park; 2d, Sir F. W. Heygate, Bellarena.

3. *Bulls calved after Jan.* 1, 1853: 1st, Lord Viscount Monck, Enniskerry; 2d, J. Douglas, Drem.

It was a very general impression, in which we concurred, that Mr. Douglas's bull, which had been commended at Lincoln, and successful at Berwick, should have been higher placed than it was. It is remarkably good in the hind-quarters; but even in front, where it is less perfect, it is better than the white bull, to which the higher prize has been awarded.

4. *Cows in Calf or Milk of any age*: 1st, and Council Gold Medal Charles Towneley; 2d, and Towneley Challenge Cup, to Mr hristy, of Adare.

The first-prize animal is exceedingly fat, and un evenly so.

5. *Heifers in Calf or Milk, calved in* 1851: 1st, R. Booth Warlaby; 2d, Charles Towneley.

Both beautiful animals.

6. *Heifers in calf or in milk, calved in* 1852: 1st, James Douglas, of Drem, for his heifer, shown successfully now at Lincoln, Berwick, and Armagh; 2d, W. Chorley, Belfast.

7. *Heifers calved after Jan.* 1, 1853: 1st, J. Richardson, Lisburn; 2d, Lord Lurgan, of Lurgan.

HORSES.

1. *Cart Stallions foaled in* 1847—52: 1st, C. P. Leslie, M.P., Glasslough, a dark grey Clydesdale stallion; large breed; but not remarkable for power or size; 2d, S. Nait, Edenderry.

2. *Stallions foaled after Jan.* 1, 1852: 1st, Lord Clermont, Dundalk; 2d, J. Ronaldson, Newtown Mount Kennedy.

3. *Cart-mares in foal:* 1st, G. Roe, Donnybrook; 2d, Earl of Annesley, Castlewellan.

4. *Cart fillies foaled in* 1851: 1st, Lord Clermont, Dundalk; 2d, N. M. Archdall, Enniskillen.

5. *Cart fillies foaled after Jan.* 1852: 1st, T. Butler, Clonee; 2d, Lord Clermont.

IMPLEMENTS.

There is a very excellent collection; the only one we have seen where there is a fair mixture of the English, Scottish, and Irish manufactures. At Berwick there were few English machines, and at Lincoln hardly any Scotch. Here Messrs. Ransome, and Garrett, and Richmond, and Smyth are pretty large exhibitors; and the names of Robinson, Ritchie, Gray, and others, ensure a full representation of the Irish makers. But few Scotch makers have exhibited; but the character of those shown by Irish makers is the same as that of the Scotch implements. In ploughs, for instance, few parts very strongly put together, and heavy in themselves, are the leading features. The English plough is lighter to lift and to draw, but the appearance of complexity about them is distasteful to the Scottish ploughman. There is a large collection of implements, and it, with the show of short-horns, Leicesters, and horses, makes the Armagh meeting the best the Society has yet seen. We must enumerate some of the prize implements which have almost all been noticed in past reports of Lincoln and of Berwick. Messrs. Richmond and Chandler take the prize in chaff-cutters and for their well-known steaming apparatus. Messrs. Ransome received prizes for their two-horse threshing machine, their whipple trees on the *truss* principle, and they were commended for their Suffolk horse-rake, their double-action Gardners' Turnip cutter, and their self-acting hay rack, in which the hay is pressed upwards against horizontal grating through which the horse feeds upon it. Messrs. Ritchie, of Ardee, received a prize for a drill plough, with mould-boards capable of ingenious adjustment as to width. Mr. Grey, of Belfast, has prizes for a subsoil plough, on the Deanston principle, only with two spurs instead of one; and for a turnwrest plough, with two mould boards, one of which is lifted into the air while the other is at work. This also was invented, if we remember rightly, by the late James Smith of Deanston. Mr. Grey's drill grubber also receives a prize. Mr. Garrett is, of course, justly commended for his horse-hoe. Mr. Smyth, of Peasenhall, receives the gold medal for his simple Turnip and manure drill. The prize churn, one in which the vessel is divided longitudinally, and the churn is, in effect, a mill working in one direction, and, as it works, grinding the milk in its passage round and round, much as rags are ground in the paper-mill, was exhibited by Mr. Robinson, of Belfast. The prize cart was shown by Mr. M'Connell, of Armagh; the prize grubber by Mr. O'Hare, also of Armagh.

It only needed better weather to have made the meeting as it deserved to be. We can as yet speak only of one day; if Thursday and Friday should prove dry, we doubt not large numbers will profit by the examination of the most instructive show yard which the Society has yet exhibited.

YORKSHIRE AGRICULTURAL SOCIETY.—The seventeenth annual meeting and show of the Yorkshire Agricultural Society was held at Ripon, on Tuesday, Wednesday, and Thursday last. The entries of stock and implements were very large; and in that respect the show must be regarded as perfectly successful, but the attendance of company was not quite equal to the years when the show was held at Leeds, at Sheffield, or at York. There were two novel features in this year's show. The first was the offering of premiums to parties growing the best crops of Flax within 10 miles of Leeds, as well as prizes for the best specimens of scutched Flax and Flax straw. The second novelty was the premium of 50*l.* for the best and most complete set of fixed barn works for threshing and dressing grain by steam power. In both instances, the premiums, now offered for the first time, produced all the good effects anticipated. The Flax prizes promise to give an impetus to the Flax cultivation in this part of the kingdom. The Leeds Flax Society, in proposing that these premiums should be offered by the Yorkshire Agricultural Society, saw that the war with Russia was calculated to interrupt the importation of Russian Flax and Flax seed, and they also foresaw that Flax is a crop which must be a profitable one to English farmers. Some objection had been felt, however, by large landed proprietors, to grow the Flax, on the ground that it is an "exhaustive crop;" but it is satisfactory to know that this opinion is rapidly exploding. Another feature of the show also deserves mention. We refer to the exhibition of long and short wool in fleeces. Although there were some good wools shown, the competition was not so keen as could have been hoped for; but it is to be hoped that these prizes may tend to improve the quality of our Yorkshire wools—a matter important alike to manufacturer and grower.

The Yard Implements were tried in a field called Parkfields, on Tuesday. The trial of Reaping Machines was made on Tuesday evening, upon some land belonging to Mr. Harland, at Copt Hewick, three miles from Ripon, the crop being one of green Rye—a very fair crop, about half of which was standing, the rest more or less laid. The attendance at the trial was large. The only implements competing for the prize were M'Cormick's, and Bell's improved; the latter was exhibited by Mr. Crosskill, of Beverley, and the former jointly by Mr. Matthews, of Driffield, and Burgess & Key, of London. Bell's machine was first started, and amongst the corn which stood well it performed its work for three or four times round in a satisfactory manner, considering that the corn was in a green state, and, consequently, more difficult to sever in the stalk than if it had been ripe. M'Cormick's reaping machine was next set in motion, and to some extent was equally satisfactory, but did not get on without some stoppages, so well as Bell's machine. Both reapers were then tried upon the laid corn, but the trial was unsuccessful; in fact, neither machine could deal with the laid corn. The general opinion amongst the company was, that Bell's machine effected its work the more efficiently of the two; but the agriculturists seemed to think that very material improvements must be effected in these machines before they could be brought into general practical use. The opinion of the judges may be opined from the fact that they have withheld the prizes for reaping machines.

The Show Yard, both for cattle and implements, was a short distance out of the city on the Studley Road. Of cattle there were 134 entries, of sheep 84, of pigs 149, of horses 196, and of poultry 288. Of implements there was also a large and interesting display, the articles commanding most attention being a patent combined threshing, winnowing, and cape stripping machine, exhibited by Tuxford & Sons, Boston, Lincolnshire; a set of barn works, constructed for threshing all kinds of grain ready for market, shown by Clayton, Shuttleworth, & Co., Lincoln; and an improved portable combined thrashing, shaking, and dressing machine, shown by R. Hornsby & Son, Grantham. These machines were accompanied by portable steam engines, and as they were kept in motion most of Wednesday and Thursday, the farmers and landowners attending the show had the fullest opportunity of testing the value and utility of these inventions.

At the Council Dinner the subject for discussion was "The best way to obtain yearly servants in agriculture, and to obviate the evils of the present system of hiring without character." Mr. Rutson considered that the present position both of master and servant, but especially that of the latter, stood much in need of improvement. He would, however, merely lay before the Society the question whether the time had now arrived when men should derive a profit from their character as well as from their bodily labour, and also when masters should have a security of good character? He considered the question of great importance.—Mr. Crompton, from an experience of 30 years as a magistrate in an agricultural district, considered that there were very few women or men of good character who had any difficulty in procuring a situation, or were compelled to go to the statutes in search of one. Even if they should be thrown out of place they are invariably, almost, sought by some neighbouring farmer, and in this way they seldom lacked a situation. But before the condition of the farm servant could be materially ameliorated, the statute law affecting them must be altered, and if that could be done, the benefits likely to result from the alteration would be undoubtedly great. He then alluded to the hardships of the present law of statute-hirings, and stated that he had found that the complaints coming before him were generally made by the same persons, good farmers seldom or never appearing to take advantage of the manifest injustice of the law.—Mr. Wells, farmer, Booth Ferry, thought the question was particularly a farmers' question. They had two classes of servants—day servants and hired servants—and he thought character ought to form a very essential part of the contract. He had had some 10 or 12 servants to engage yearly, and he had found an immense deal of difficulty in obtaining men of character. With reference to female servants there was not so much difficulty, for a good female servant, if not retained in the family, was sure to be engaged by some one in the neighbourhood. There was great difficulty with boys, who were fond of change, and seemed to think two years in one place quite sufficient. Unfortunately there was another difficulty. In agricultural towns they had two or three statutes before Martinmas-day, and magistrates knew that though a servant might have received his or her godspenny, if they had not commenced their servitude the engagement was not binding unless it was in writing, and the result was that many after receiving their godspenny re-engaged themselves on the offer of higher wages, and left their previous employer without any remedy. Last Martinmas, after all the statutes were over, he ascertained that four or five of the servants he had engaged had re-engaged themselves, and he was compelled to fill up his complement of servants without character, and the consequence had been that he had had nothing but difficulty ever since. He always inquired as to character, and he thought the engagement ought to be in writing, each party taking a copy, so that there might be something like reciprocal protection.

The following is the award of prizes for Cattle, Sheep, &c.:—

SHORT-HORNED CATTLE.—Best bull, 25*l.*, C. Towneley; 2*l.* Henry Vyner. Best yearling bull, 20*l.*, C. Townley; 5*l.*, Lord Feversham. Best bull calf, 10*l.*, C. Towneley. Best cow, in calf or milk, 15*l.*, C. Towneley; 5*l.*, Earl de Grey. Best three-year-old cow, in calf or milk, 10*l.*; R. Stratton; 5*l.*, R. Stratton. Best two-year-old heifer, in calf, 10*l.*, T. C. Constable; 5*l.*, C. Towneley. Best yearling heifer, 10*l.*, C. Towneley; 5*l.* T. C. Constable. Best heifer calf, upwards of five months old, 7*l.*, C. Towneley; 3*l.*, G. Wentworth.

CATTLE OF ANY BREED.—Best cow for dairy purposes, 7*l.* C. Cradock.

LEICESTER OR LONG-WOOLLED SHEEP.—Best shearling ram, 20*l.*, W. Abraham; 5*l.* J. Borton. Best ram of any age, 10*l.*, W. Abraham; 5*l.* W. Abraham. Best pen of five ewes, 7*l.*, G. Walmsley. Best pen of five shearling wethers, 5*l.*, G. Walmsley. Best pen of five shearling gimmers, 12*l.*, W. Abraham; 5*l.*, G. Walmsley.

SOUTHDOWN SHEEP.—Best shearling ram, 10*l.*, G. S. Foljambe. Best southdown ram of any age, 10*l.*, to Lord Walsingham. Best pen of five southdown ewes, 5*l.*, Lord Walsingham.

BLACK-FACED SCOTCH OR HIGHLAND SHEEP.—Best ram, 5*l.*, R. Pearson. Best pen of five ewes, 5*l.*, R. Pearson.

PIGS.—Best boar, large breed, 5*l.*, T. M. Richardson; 2*l.*, Craven. Best sow, large breed, in pig or milk, 7*l.*, Earl Fitzwilliam; 2*l.*, P. Sturdy. Best boar, small breed, 5*l.*, G. Mangles; 2*l.*, W. B. Wainman. Best sow, small breed, in pig or milk, 7*l.*, G. Mangles; 2*l.*, G. Mangles. Best three store pigs, of the same litter, from four to nine months old, 5*l.*, S. Wiley; 2*l.*, A. Fawkes. Best sow of any breed, not qualified to compete in classes 21 or 23, 5*l.*, T. Craven; 2*l.* J. Dean. Best boar of any breed not qualified as above, 5*l.*, G. Mangles.

HORSES.—Best stallion for hunters, 10*l.*, Mr. H. S. Waring, Darlington; 3*l.*, Mr. T. Groves, Plumpton Hall, Knaresborough. Best stallion for coach horses, 10*l.*, Mr. A. Hairsine, Holme, Hayton; 3*l.*, Mr. T. Marshall, Low Catton, Stamford Bridge. Best stallion for roadsters, 10*l.*, Mr. J. Crompton, Thornholme, Bridlington; 3*l.*, Mr. G. Long, Kearby, Wetherby. Best stallion for agricultural purposes, 10*l.*, Mr. G. Chapman, Thorphill, Whixley; 3*l.* to Mr. J. Stead, Bishop Thornton, Ripon. Best stallion for agricultural purposes, to attend at Ripon on every market day for the season of 1855, and to travel in the district, 20*l.*; Mr. R. Emsley, Markington, Ripley. Best mare and foal for hunting, 7*l.*, Mr. T. Swarbreck, Sowerby, Thirsk. Best mare and foal for coaching, 7*l.*, Mr. J. Lee, Thirsk. Best roadster mare and foal, 5*l.*, Mr. J. T. Robinson, Leckby Palace, Thirsk. Best mare and foal for agricultural purposes, 10*l.*, Mr. T. Wetherell, Kirkbridge, Darlington. Best three-year-old hunting gelding, 5*l.*, Mr. R. Stockdale, Skerne, Driffield. Best three-year-old hunting filly, 5*l.*, Mr. T. Batty, Wallerthwaite, Ripon. Best three-year-old coaching gelding, 5*l.*, Mr. T. Wetherell, Kirkbridge, Darlington. Best three-year-old coaching filly, 5*l.*, to Mr. W. Morton, Ainderby, Quernhow, Thirsk. Best two-year-old coaching gelding, 5*l.*, Mr. B. Johnson, Frodingham Bridge, Driffield. Best two-year-old coaching filly, 5*l.*, Mr. J. Dodsworth, Seamer, Stokesley. Best three-year-old hackney gelding or filly, 5*l.*, to Mr. Vyner, Newby Hall, Ripon. Best hackney gelding or mare, not less than four years old nor exceeding six, 5*l.*, Mr. Swarbreck Sowerby, Thirsk. Best pair of horses, of either sex, for agricultural purposes, worked during the season, 5*l.*, Mr. Batty, Bishop Monckton, Ripon. Best two-year-old agricultural gelding or filly, 7*l.*, Mr. J. Bennett, Snargill, Skipton. Best yearling gelding or filly for agricultural purposes, 5*l.*, Mr. J. Batty, Bishop Monckton, Ripon.

FLAX.—For the best cultivated and harvested crop of Flax, grown within 10 miles of Leeds, the quantity not being less than 5 acres, 20*l.*; second do., 10*l.* There were two competitors in this class, viz., Mr. Thomas Robinson, Halton, Leeds, and Mr. G. Barker, South Milford, Sherburn. Class 72, for ditto, not less than 2 acres, 5*l.*; 2d do., brought six competitors into the field, namely, Messrs. S. Walker, Normanton; W. D. Lord, Rawdon, Leeds; John Mawson, Burmantofts Grove, Leeds; Thomas Robinson, Halton, Leeds; W. Bayford, Arthington, Otley; and J. W. Scriven, Throstle Nest, Otley. The judges were by the rules required to view the Flax on the land, and take into special consideration the marketable condition of the article. As the state in which the crop is harvested, as well as its cultivation, have to be considered, these premiums cannot be yet awarded.—Best specimen of scutched Flax, not less weight than 2 cwt., 10*l.*, to John Boyle, Whitebeck Mill, Leeds; 2d do., 5*l.*, to R. Beilby, Fairfield, York. Best specimens of Flax straw, not less than 5 cwt., 10*l.*, to John Atkinson, Shaw Mill, Ripley; 2d do., 5*l.*, to John Boyle, Whitebeck Mill, Leeds.

IMPLEMENTS.—For the best and most complete set of barn works for threshing and dressing grain, a prize of 50*l.* was awarded to Messrs. Clayton, Shuttleworth, & Co., Lincoln; best assortment of ploughs, 10*l.*, to John Palmer, Stockton; best assortment of harrows, 5*l.* to do.; best cultivator, or scarifier, 5*l.*, to R. Coleman & Son, Chelmsford; best reaping machine, 15*l.* (prize withheld); best waggon, 5*l.*, to Crosskill, Beverley; best single-horse cart, 5*l.*, to W. Banks, York; best corn drill, 5*l.*, to R. Hornsby & Son, Grantham; best Turnip drill on the flat, 5*l.*, to do.; best Turnip drill on the ridge, 5*l.*, to do.; best manure distributor, 5*l.*, to J. Palmer; best grinding mill, 5*l.*, to Clayton & Co.; best tile machine, 4*l.*, to H. Kearsley, Ripon; best Norwegian harrow, 2*l.*, to do.; Bentall's broad-share plough, 2*l.*, to W. Busby, Newton, near Bedale; roller mill, for corn, Linseed, &c., 2*l.*, to T. Turner, York; morticing machine, 2*l.*, to W. Coulon, York; corn-dressing machine, 2*l.*, to R. Hornsby; Nicholson's cake breaker, 2*l.*, to W. Dove, York; the most useful col-

s

lection of articles, 1*l.*, to Geo. Meynell, Northallerton; Howard's horse-rake, 2*l.*, to W. Busby; models for horseshoes, 2*l.*, to Matthew Pratt, Ripon; general purpose drill for small occupations, 2*l.*, to Thomas Malthouse, Ripon.

MEDALS.—To P. Stevenson, jun., Thirsk, for traversing web in Turnip drill; to W. Busby, for T. H. Brinsmead's straw shaker; and to John Patterson, Beverley, for washing, wringing, and mangling machine.

HIGHLY COMMENDED.—Crosskill's improved self-cleaning clod-crusher, W. Crosskill, Beverley; quadrant regulator in drill, W. Moore, Ripon; Smith's haymaker, J. Palmer; and portable engine, R. Hornsby, Grantham.

COMMENDED.—Crosskill's clod-crusher, Crosskill; Cambridge's roller, B. Stead, Barnsley; single-horse cart, J. Barker, York; Barley humbler, Lucas & Wright, Lincoln; Chambers's liquid drill, Jesse Kemp, Alford, Lincolnshire.

RECEIPTS AND ATTENDANCE AT THE SHOW.—The money taken for admission to the show yard was quite as much as had been anticipated. On Wednesday there were 3200 persons admitted to the show ground by half-crown tickets; the receipts for the day being 210*l.* On the shilling day (Thursday), however, the number present amounted to 10,000, the receipts that day being about 500*l.*, or 710*l.* in the aggregate. *Abridged from the Leeds Mercury.*

HIGHLAND SOCIETY'S MEETING AT BERWICK.—We append a short paragraph squeezed out of last week's report:—

Horses.—There was a very large show of horses—the Clydesdale breed being fully represented. The first prize in Class I. was taken by a large grey horse, very deficient, as we think, in the hind quarters, exhibited by Mr. Phillips, of Brampton; the second by Mr. Morton, of Lambolethan, near St. Andrew, for a smaller, but more compact and better made black horse; the third by Mr. Smith, of Edinburgh. The following are the awards under this head:—

HORSES FOR AGRICULTURAL PURPOSES.

Best stallion: 30*l.* and the silver medal, Charles Phillips, Brampton, Cumberland; 15*l.*, John Morton, Lambolethan, St. Andrews.

Best entire colt, foaled after 1st January, 1851: 20*l.*, Robert Findley, of Easterhill, Glasgow; 10*l.*, Thomas Muir, Bowhouse, Lanark.

Best entire colt, foaled after 1st January, 1852: 10*l.*, John Pattie, Tinwald, Dumfries; 5*l.*, James Douglas, Drem.

Best entire colt, foaled after 1st January, 1853: 8*l.*, Andrew Allan, Dundonald; 4*l.*, Robert Murdoch, Cambuslang.

Best brood mare: 20*l.*, Andrew Logan, Kilbarchan; 10*l.*, James Douglas, Drem.

Best filly, foaled after 1st January, 1851: 10*l.*, David Wright, Preston-Pans; 5*l.*, Andrew Logan, Crossflat.

Best filly, foaled after 1st January, 1852: 8*l.*, Robert Jack, Campsie; 4*l.*, Thomas Smith, Alnwick.

Best filly, foaled after 1st January, 1853: 6*l.*, William Kerr, Midcalder.

Sheep.—In Leicesters two very distinct classes of sheep appeared to be exhibited; the border Leicesters being stronger-built, larger-framed, whiter-faced, and longer-woolled sheep than those of English breeders, with which they competed. It so happens that two English and two Scotch judges were appointed, and that in apportioning the work of examination, two parties of one English and one Scotchman examined the several classes, with the understanding that any differences of opinion arising were to be settled by calling in as umpire the Englishman from the other side respectively. These differences of opinion have been continually arising, we have no doubt whatever, and thus an English judgment has been given in every case, where a judgment more in accordance with the experience of the locality would have been more satisfactory, and, as we believe, much wiser. The smaller, finer sheep, of excellent quality no doubt, in every case carried the day; the judgment having, of course, been consistent throughout. The prizemen were Mr. Wiley, of Brandsby, York, who took a great many prizes; Mr. Douglas, of Drem; and Mr. Collie, of Elgin, who bred, we understand, from Mr. Wiley's sheep and those of Mr. Sanday.

The Cheviot sheep were well represented by a number of large animals of good frames well covered by *carefully clipped* fleeces. We regret not having room for more detailed specification, either in this class or the southdowns, where the Duke of Richmond, Messrs. Aitcheson of Haddington, Forster of Rothbury, Hunter of Thurston, Oliver of Kelso, and Tod of Tranent, were the prize-holders. Among the Cheviots, Messrs. Brydon of Langholm, Elliot of Hindhope, and others, were prize-holders. The following are the awards in the case of sheep and pigs:—

SHEEP.

LEICESTERS.—*Best tup under four shear:* 20*l.*, Samuel Wiley, Brandsley, York; 10*l.*, James Douglas, Drem.

Best Shearling Tup: 20*l.*, second best, 10*l.*, S. Wiley.

Best pen of five ewes under four shear: 10*l.*, S. Wiley; 5*l.*, James Douglas.

Best pen of five shearling ewes: 10*l.*, John Collie, Elgin; 5*l.*, James Douglas.

CHEVIOTS.—*Best tup under four shear:* 15*l.*, 8*l.*, James Brydon, Langholm.

Best shearling tup: 15*l.*, 8*l.*, John Carruthers, Moffatt.

Best pen of five ewes under four shear: 8*l.*, James Brydon, Moodlaw; 4*l.*, Thomas C. Borthwick, Langholm.

Best pen of five shearling ewes: 8*l.*, James Brydon; 4*l.*, T. C. Borthwick.

BLACKFACED BREEDS.—*Best tup, under four shear:* 10*l.*, Robert Patterson, Biggar; 5*l.*, James Tweedie, Nether Abington, Lanarkshire.

Best shearling tup: 10*l.*, James Tweedie; 5*l.*, John Watson, Biggar.

Best pen of five ewes, under four shear: 6*l.*, James Brydon; 3*l.*, Adam Blacklock, Moffat.

Best pen of five shearling ewes: 6*l.*, Allan Pollok, Ronachan; 3*l.*, George Proudfoot, Moffatt.

SOUTHDOWNS.—*Best tup, under four shear:* 10*l.*, James Aitchison, of Alderston; 5*l.*, the Duke of Richmond.

Best shearling tup: 10*l.*, 5*l.*, Mr. Aitchison, of Alderston.

Best pen of five ewes, four shear: 6*l.*, the Duke of Richmond; 3*l.*, Robert Oliver, Lochside, Kelso.

Best pen of five shearling ewes: 6*l.*, Wm. Tod, Tranent; 3*l.*, Robert Oliver, Lochside.

PIGS.

Best boar, large breed: 10*l.*, Jonathan Brown, Wigton; 5*l.*, George Hay, Dalkeith.

Best boar, small breed: 10*l.*, Jonathan Brown; 5*l.*, R. H. Watson, Bilton Park, Wigton.

Best sow, large breed: 6*l.*, Henry Atkinson, Alnwick; 3*l.*, George Murray, Berwick.

Best sow, small breed: 6*l.*, Jonathan Brown; 3*l.*, George Moore Dixon, Morpeth.

Best pen of three pigs, under eight months old: 4*l.*, R. H. Watson; 2*l.*, Nicol Milne, of Faldonside.

In addition to the above there was a considerable exhibition of Poultry.

SOCIETY FOR THE PROMOTION OF THE GROWTH OF FLAX IN IRELAND, *July* 26.—Placards, pointing out the importance of saving seed for next year's sowing, to provide against the probability of there being little or no supply of Riga seed obtainable, had been posted up in 134 towns and villages. It having also been suggested that, in country districts, the most likely means for bringing this important question before farmers would be by posting those placards in the vicinity of places of worship, copies had been sent to upwards of 300 clergymen, with a request that they would have this done, and a parcel of instructions for saving seed had been also sent them for distribution among the members of their congregations. The latter documents had also been forwarded to many landed proprietors and farming societies. By these and other means, it was hoped that a large saving of seed would be secured. Mr. Roche, M.P. for county Cork, had 2500 acres of Flax on his estates, from all of which he purposed saving the seed, which would alone yield upwards of 7000 barrels, at least.

A letter and samples of Flax fibre had been received from Mr. Turnbull, Rosemill, Dundee, who wrote as follows:—

"Having for a period of years devoted great attention to the preparation of Flax straw, previous to scutching, as well as to the latter operation itself, and having tried upwards of 700 experiments, chemical and mechanical, I have succeeded in discovering what I consider to be the key to the treatment of Flax straw, and I can make very fine fibre from straw which will give but a mediocre article under any of the methods in use. I can make, from any Flax straw, an article admirably suited for shoe-threads, and yielding about 90lbs. of dressed fibre from 112lbs. of raw Flax, fit to spin 20 to 30 lea yarn. From the same straw, by other treatment, I can make Flax fit to spin 80 to 100 leas. In both cases great strength and excellent spinning quality. I enclose a small sample of each kind.

"As regards scutching, my machinery, which is very simple, gives all the fibre as *long line*, at a cost, for wages, of less than 4*s.* per cwt. of scutched Flax, reckoning boys' and women's wages at 5*s.* per week. All the fibre is preserved, the waste being only of the very short or broken straws and a portion of the branches. My yield from 100lbs. of seeded straw varies from 18 lbs. to 22 lbs., according to the quality of the straw, the fully-ripened always giving the most fibre, of the best quality, and much the easiest to prepare and scutch.

"All this may appear over sanguine, but I have often tested and proved its accuracy. There are no limits to the changes in organic matters, of which a portion of the Flax plant consists, and the quality of the fibre is very much determined by the changes which can be produced in the easily-soluble organic matter surrounding it.

"The coarser sample was prepared from the straw, and ready to dry for scutching in three hours—the finer requires three days. The scutching machinery is just as well adapted for hand labour in the cottage as for factory. Taking seeded straw at 4*l.* per ton, the Flax can be brought to market under 40*l.* per ton.

"As the society is in communication with the most extensive and enterprising of the Flax manufacturers, its aid in inducing some of these to make trial of my inventions, would conduce to results much earlier and more beneficially than by any other way."

The samples of fibre sent appear very strong, and fairly to warrant Mr. Turnbull's statements as to quality. The Chairman exhibited two specimens of the Flax plant, each upwards of 4 feet long, and in every respect equal; one being grown from Riga seed, and the other from home-saved, the first year's saving from Riga. Both were sown in the same field, on the same day. He was very desirous they should be treated alike, throughout, in order that the result should satisfy farmers as to the value of home-saved seed. Mr. Niven showed samples of plants grown from the Continental white-blossomed variety, and from the yellow seed obtained from America. They appeared of fair quality. The flowers of the latter were differently formed from Flax flowers generally, being more pointed. Mr. J. S. Crawford, of Redemon, reported favourably, also, of the crop growing on his land from the American seed.

Poultry.

Carriage of Eggs.—For the benefit of your correspondent "T. S. W.," and of others who may feel interested, I beg to hand you the following details respecting the eggs I sent to the United States:—

	No. sent	From	How Packed	Broken	Hatched
Sebright Bantams.....	12	Manchester	Bran	None	None
Black Spanish,.....	12	ditto	do.	do.	8
Ditto	12	Carlisle	Straw & Bran	2	6
Grey Dorkings.....	12	ditto	do.	2	6
Black-Breasted Game...	13	Liverpool	Oats	None	9
	61			4	29

Of the black Spanish from Carlisle, one proved a sickly bird and died, leaving 28 strong healthy chickens, hatched from 45 eggs, that is after deducting breakages, and striking out the bantams as a total failure. My friend says—"I am much pleased with the result. The eggs had every advantage—the hens were ready for them, and they sat better than any I have tried this season. The same day I set the English eggs I set five dozen received from Pennsylvania, and have not more than ten chickens out of the lot." The eggs came to me packed, and with the round end of the egg uppermost, as above, in three boxes, which were afterwards enclosed in a stout case, placing them so as to maintain the eggs in the same position. The case was, by permission, placed under care of the steward of the steamer, with instructions to keep it in a cool place (not the ice house), and to take care that it was not knocked about, and that the top, which had been marked, was kept uppermost. The eggs reported by "J. B.," in your paper of the 29th ult., as having been received by him from America, and hatched under very unfavourable circumstances, were sent in return for part of those I sent out, and were packed in sawdust. These being hatched at all was quite beyond my expectation, and therefore I must presume that sawdust answers exceedingly well for packing eggs in; but were I again sending out eggs, I should give the preference to Oats (free from dust), to pack them in; and for any quantity, I should again adopt the plan of dividing them by means of small boxes inclosed in a large case. *D. J.*

Miscellaneous.

Agricultural Labourers.—The progress of agriculture, like that of every other manufacture, is in no small degree dependent upon the intelligence, trustworthiness, and general carefulness of the workmen. The hinds of East Lothian have been long distinguished by such qualities; and any report on the farming of East Lothian would be defective which did not bear tribute to their general intelligence and trustworthiness. Nowhere does there exist more of that community of feeling, and that friendliness of relation which ought to subsist between the employers and the employed, than in this county. The servants not only occasionally suggest improvements, but endeavour to carry out what is novel, whether in the adoption of new implements or of what is new in practice. On some farms the same families have sustained the relation of master and servant for at least two generations. This, however, is somewhat on the wane, and indeed modern habits scarcely admit of this rather interesting feature in the domestic history of the past being preserved intact. *From the Report on the Farming of East Lothian, by Mr. Stevenson, in the Eng. Ag. Soc. Journal.*

Calendar of Operations.

JULY.

WESTER ROSS: *July* 31.—All hands are busily occupied with Turnip hoeing. On many farms the first hoeing has been completed; on others there is still a good deal to do. Fly has been complained of, but its ravages this year have been limited and comparatively insignificant. The complaint is now loud that "finger and toe" is making alarming havoc. That it has made its appearance in a few fields is true; that it is to become general is not yet manifest. This disease can be ordinarily cured by deep ploughing, and an application of lime some years previous to the Turnips being sown, so that the lime being thoroughly incorporated with the soil, and having had time to operate, the soil may be freed from those noxious substances which are so injurious to Turnips. The earlier Turnips look well, the later ones are regularly brairded and promising. Potatoes, although this year unaffected with the disease, will not be such an abundant crop as last year. In many places the braird was irregular, weak, and unhealthy, and generally speaking they are not nearly so luxuriant as last season. About a fortnight ago the disease was observed, and it still continues to spread, so that now there is scarcely a field without symptoms of it. The fields first attacked are now nearly all black, and there is little hope of any of the others. Formerly the disease made its first appearance amongst Potatoes growing in gardens, or in low, deep, richly-manured soils; this year, strange to say, it has first appeared on the higher grounds, and is, as yet, very little seen in the garden or richer soils. There was a larger breadth planted this year than there ever was in any former one, and consequently there was much depending on them. Last year there was 100,000*l.* received for Potatoes shipped at Inverness, Nairn, Beauly, and a few of the northern ports, and the belief was general that, should the root be cultivated, somewhat more extensively, our fortunes would be speedily secured. "The best laid schemes of mice and men gang aft a-glee." For the last few weeks the weather has been very favourable for our grain crops, and harvest comes on speedily. The Wheat is a heavy crop, and is not so much affected with rust as was anticipated, yet it prevails to a considerable extent in the heavier fields, where the wet was not so readily dried up by the wind. Oats and Barley are fully an average crop. The great Inverness sheep and wool fair was held on the usual days. Prices offered for wool were so much below those of last year that farmers preferred keeping on, and scarcely a sale was effected. Sale of sheep was brisk, at a reduction on last year's prices, of from 1*s.* to 2*s.* 6*d.* per head. At this market there is no stock exhibited, the purchaser being previously acquainted with the kind of stock possessed by the disposer, concludes a bargain without having seen his purchase at all. Emigration is producing its natural effect in the north; work-people have had increased wages through the summer, and expect still higher wages for harvest work.

Notices to Correspondents.

CHEVIOT SHEEP: *Young Farmer.* Next week. Or if you have the book, see article MARKETS, "Blackie's Cyclopædia of Agriculture."

CONSUMPTION OF FOOD: *Anon.* Your 80 Down ewes (large size), will need nearly a ton of roots per day, as taken from the heap—which means probably 16 cwt. of cut roots. If kept thinly over Grass land during winter, half that quantity will keep them in "store condition."

TOP DRESSING: *Iscoed.* The absence of the editor from town has occasioned the delay. A pasture field of good soil mown every year for 10 years, wants a good top-dressing by this time. Your mixed lime earth and bone-dust would no doubt be beneficial. And some ammoniacal addition will be advisable as an after application in wet weather—10 bushels of bonedust (fine), and 30 or 40 bushels of soot will probably answer the purpose, the former applied now, the latter in early spring. Or, instead of the soot and much better, apply 3 cwt. of good guano, along with a cart-load of vegetable mould per acre in March next.

ERRATUM: for "many tried implements" in the note on Smith, of Deanston's, subsoil plough, shown at Berwick (see last week's *Gazette*) read "many tined implements."

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells. £ s. d.
Patent Pump 1 15 0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing 3 0 0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, rom underground Water Tanks, and can e readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

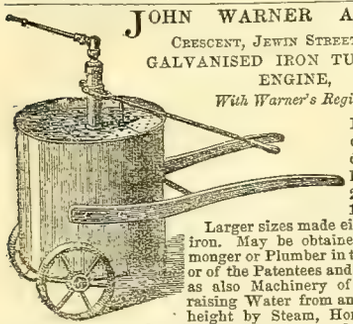
Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,

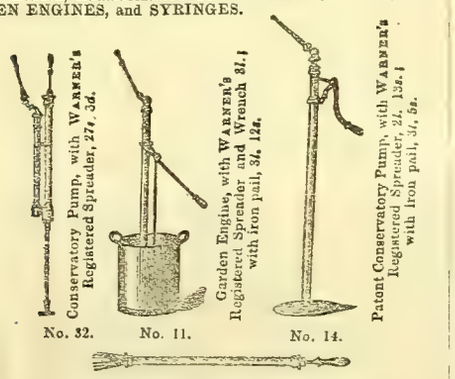


Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent,

London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27*s.* 3*d.*
Garden Engine, with WARNER'S Registered Spreader and Wrench 31.
with iron pail, 34. 12*s.*
Patent Conservatory Pump, with WARNER'S Registered Spreader, 24. 13*s.*
with iron pail, 31. 5*s.*
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 12	,,	24	,,	,,	45	,,	... 5 0
No. 14	,,	30	,,	,,	45	,,	... 5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

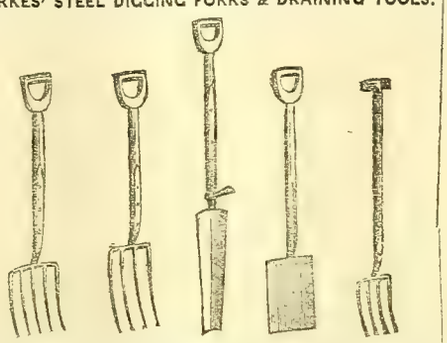
PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, HYDRAULIC ENGINEER, 70, Strand, and Bridgefield, Wandsworth.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

CORN CRUSHERS AND CHAFF CUTTERS.—

A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps

were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.

103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes

awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.

103, Newgate Street, London.

THE ADVANCE OF SCIENCE IN AGRICULTURE.

RICHMOND AND CHANDLER'S unprecedented celebrity for their improved CHAFF MACHINES and CORN CRUSHERS, achievable only by intrinsic merit, has secured for them the highest character in the trade, together with the confidence of the public, whether as regards true economy or the unapproachable finish and sterling quality which characterise all their productions, and render them worthy the reputation of a Manchester manufacturer.

The most distinguished authorities in all civilised countries report their unqualified satisfaction with the highly beneficial effects resulting from the use of these justly celebrated Machines, and with the now established fact of their not being subject to any of the contingencies inseparable from other machines, they are calculated to meet with general approval in the present advancing state of agriculture.

Address—RICHMOND & CHANDLER, Salford and Manchester; and 32, South John Street, Liverpool.

CHAFF-CUTTERS, of the best workmanship, 25*s.*;

Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BARTON'S PATENT STABLE FITTINGS AND ENAMELLED MANGERS.—These Fittings have all

the newest improvements and are the only patented invention of this description.

JAMES BARTON, Iron Founder, Smith, &c., 370, Oxford Street, a few doors East of the Pantheon.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

IMPORTANT TO STOCK FARMERS, AND FLOCK MASTERS.

SHEEP, LAMBS, HORSES, AND CATTLE,

CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.

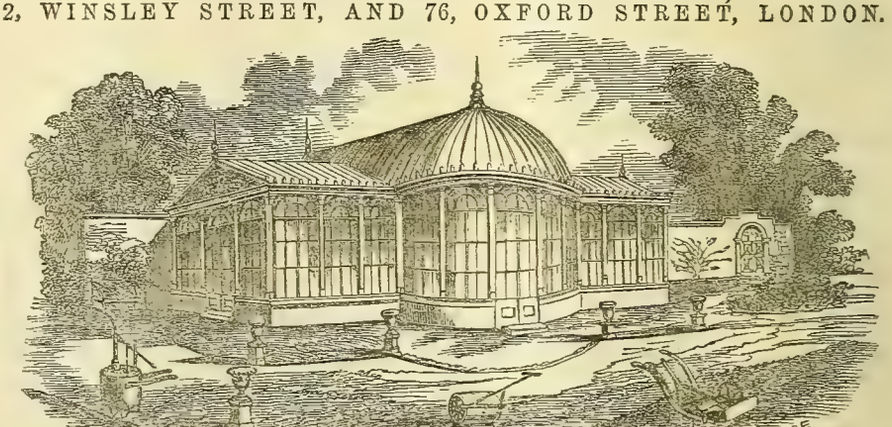
It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

Orchard House Squares on Mr. Rivers's approved plan, to whom I have sold some thousands of feet:—20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20½ by 12½, 20½ by 13½, 20½ by 14½, at 19*s.* per 100 ft.

200 feet cases at 42*s.*, and 300 feet case 68*s.*, in large sheets.

Boxes charged 1*s.* extra per 100 feet, and the same allowed if returned free of all charge.

HARTLEY'S PATENT ROUGH PLATE GLASS, Fern Shades, Striking Glasses, Milk-pans, Bee Glasses, Cucumber Tubes, Sheet and Rough Plate Glass Tiles, Wasp Traps; Plate, Patent Plate, Crown and Sheet Window Glass, in every thickness and quality, and Ornamental Glass, plain and coloured; pure white Shades for Ornaments, Crystal Glass for Pictures.

Warehouse, 67, Bishopsgate Street Without—same side as Eastern Counties Railway.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

ENCAUSTIC TILE PAVEMENTS.

MAW AND CO. Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.

It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

M'ADAM'S ANTI-GRAPE BLIGHT COMPOSITION.—"This will soon become the *standard remedy*, as it fully deserves to be."—(See *Gardeners' Chronicle*, July 1, May 27, June 10, &c.) 1lb. packets, with full printed instructions, 3*s.* 6*d.* each, sufficient for 18 gallons of wash.

Agents:—DAWE, COTTRELL, & BENHAM, 36, Moorgate Street, London. It can be ordered through any country Bookseller.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. Directions for application forwarded. Ten gallons and upwards carriage free to London.

For testimonials, see whole page of *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth.

From Andrew Toward, Esq., Royal Gardens, Osborne Palace.

"I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose Trees much affected with the Green Fly."

From Frederick Malleson, Esq., Royal Gardens, Claremont.

"I find it answer the purpose in all respects for Walls, also the Green Fly and Brown Scale in the Houses—May 9, 1854."

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton (20 yards from the Railway and Docks).

THE COMFORT OF A FIXED WATER CLOSET for 1*l.*—Places in gardens converted into comfortable water closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Indispensable for the health and comfort of a family. Hermetically sealed Inodorous Chamber Commodes, 1*l.* 4*s.*, 2*l.* 6*s.*, and 3*l.*; also, Improved Portable Water-Closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE and Co.'s, removed to more commodious premises, at 46, Leicester Square, London.

REAPING AND MOWING MACHINES.—CAUTION.—Notice is hereby given, that any person or persons infringing any of the Patents of Cyrus Hall M'Cormick, for Reaping and Mowing Machines, or making, or vending, or using, or exercising any Machines which in any way infringe upon any such Patents, will be proceeded against according to law. The more prominent features of M'Cormick's Patents consist in a serrated cutting blade, spear-head shaped holding fingers, and a gathering reel.

E. J. & H. LAWFORD, Mr. M'Cormick's Solicitors.
Draper's Hall, 27, Throgmorton Street, London, Aug. 12.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desireus of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL PANOPTICON OF SCIENCE AND ART, LEICESTER SQUARE. — CHEMISTRY, by Mr. G. F. Ansell, Monday, 2; Wednesday, 3.15; Thursday, 2; Friday, 3.15. FRICTIONAL ELECTRICITY, Monday, 3.15; Saturday, 2. SHOOTING STARS, Tuesday, 7.45; Thursday, 7.45: by Mr. W. R. Birt. NATURAL MAGIC, by Mr. Malcolm, Monday, 7.30; Wednesday, 7.30. MAGNETIC PROPERTIES OF VOLTAIC ELECTRICITY, Tuesday, 2; Structure and use of Pneumatic Instruments, Thursday, 3.15; Effects of Voltaic Electricity on Animal Life, Friday 2; Machinery and its Application to Agriculture, Saturday, 3.15: by Mr. C. F. Partington. Songs and Sayings of Samuel Lover, by Mr. E. L. Hime, Tuesday, 3.15; Friday, 7.30. Climate, by Mr. Hugo Reid, Wednesday, 2. Explanation of Machinery and Manufactures, daily at 1 and 7.15. Dioramic Miscellany, including Views of Verona, the Prismatic Disc, and brilliant Chromatropic Effects, 8.15. Distins' Flügel Horn Union, 4.45 and 10 Fountain at High Pressure, 2.45; and at 9.25, Messrs. Heinke's Improved Diving Apparatus in the Crystal Cistern. Organ performances by Mr. W. T. Best, at intervals. Hours of Exhibition—Morning, 12 to 5; Evening, 7 to 10, Saturday evening excepted. Admission, 1*s.*; Schools, and children under 10, half price.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES. — METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

DR. DE JONGH'S
LIGHT BROWN COD-LIVER OIL,
PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS, THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM, AND ALL SCROFULOUS DISEASES.

Approved of and recommended by the most distinguished Scientific Chemists, prescribed by the most eminent Medical Men, and supplied to the leading Hospitals of Europe.

EXTRACTS FROM
MEDICAL AND SCIENTIFIC TESTIMONIALS:
THE LANCET, *July* 29, 1854.

"In the preference of the light brown over the pale oil we fully concur. We have carefully tested a specimen of the light brown Cod-liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. ANSAR, HARFORD, & Co., 77, Strand. We find it to be genuine, and rich in iodine and the elements of bile."

"THE MEDICAL CIRCULAR." May 10, 1854.

"The pale oil, even when genuine, is deficient to a considerable extent, if not wholly, of the volatile fatty acid, iodine phosphate of chalk, the cholinic acid, bilifellinic acid, and other elements of bile, which are found in their normal proportions in the light brown oil. The utmost reliance may be placed upon the experimental researches of Dr. de Jongh, who is one of the most eminent of European chemists; the oil prepared by him enjoys also the additional sanction of the opinion of Baron Liebig and the late Dr. Pereira, in favour of its genuineness and efficacy. Our own experience practically confirms their judgment, and we unhesitatingly recommend the light brown oil as the best for medicinal purposes, and well deserving the confidence of the profession."

BARON LIEBIG.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this medicine, in its purest and most genuine state, must ensure you the gratitude of every one who stands in need of its use."

DR. JONATHAN PEREIRA.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, AND CO., 77, STRAND, LONDON,

Sole Consignees and Agents for the United Kingdom and the British Possessions; at the following prices:—

IMPERIAL MEASURE, half-pints, 2*s.* 6*d.*; pints, 4*s.* 9*d.*

*** Four half-pint bottles forwarded, CARRIAGE PAID, to any part of England, on receipt of a remittance of Ten Shillings.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to Nioukrene." H. ROBB, Esq.—"It has checked the greyness." Mrs. JONES.—"My hair is restored." Dr. COFFIN.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "THOMAS PROUT" is on the Government stamp.

LAND DRAINING PIPES.

WANTED, about 2 millions of AGRICULTURAL DRAIN PIPES, from 1½ to 6 inch bore, to be delivered at the Stations on the Eastern Counties Railway, or River Wharfs, as follows:—At Brentwood or Ingatestone Station, 750,000; Rainham Station or Wharf, 500,000; Waltham Station, 400,000; Romford Station, 150,000; Stratford Station, or Barking Wharf, 100,000. Parties who can supply the whole or part of the quantities are requested to send their Cash Prices, the delivery to commence by the 8th of September.—Address, Messrs. DAVIS & VIGERS, 3, Frederick Place, Old Jewry, London.

WANTED to PURCHASE, the last edition of LOUDON'S ENCYCLOPÆDIA OF PLANTS.—Any person having the same to part with may apply to W. F., Royal Gardens, Frogmore, Berks.

WANTED ON LEASE, One acre or more of ground suitable to erect Hothouses on.—P. WALKER, 48, Blackfriars Road, London.

HAWARDEN, FLINTSHIRE.

TO BE LET ON LEASE, for 21 years, from Michaelmas next, a most desirable TURNIP and BARLEY FARM, with excellent House and Premises, Cottages for Labourers, and 540 Acres of Arable and Pasture Land, well situated for markets, with a turnpike road running through the property; about one mile from the Queen's Ferry, on the Chester and Holyhead Railway, ten miles from Liverpool, and five from Chester, on the banks of the river Dee.—For further particulars, apply to Messrs. HOUGHTON & SON, Broom Hall, Sunning Hill, Berks; and to view the Farm, to Mr. ELLERBY, Sealand, Chester.

TO BE LET ON LEASE, with immediate possession, or at Michaelmas, an excellent FARM, containing 130 acres of Arable Land, situate midway between Guildford and Farnham, 1½ mile from the Ash Station.—Apply to Mr. FINNEY, Guildford, Surrey.

SEATON, ON THE SOUTH COAST OF DEVON.

TO LET, for a Term of Years, from Michaelmas, 1854, a compact FARM, comprising a capital House, convenient Offices, and 205a. 1r. 34 p. of Land, of which 25a. 2r. 2p. is Meadow, 2a. 3r. 4p. Orchard, 18a. 2r. 25p. Pasture, and 154a. 3r. 5p. Arable.—To view, apply to Mr. AYNSLEY, at the Farm; and for particulars to Mr. JAS. BABBAGE, Nettlecombe, Taunton.

TO GARDENERS.

TO BE LET, for a term to be agreed upon, a valuable MARKET GARDEN of eight acres, well stocked with Fruit Trees; together with the Dwelling-house and long-established Fruit and Milk Shop. The house is situated in the centre of a flourishing market town within 40 miles of London and adjoining a railway. An additional 3½ or 6½ acres of Garden Ground, and 4½ acres of Orchard and Grass Land, may be had if required.—Apply to Messrs. BATT, RUTLEY, and SILVERLOCK, 412, Strand, London.

TO MARKET GARDENERS AND OTHERS.

TO BE LET, with Immediate Possession, a MARKET GARDEN GROUND, containing about 28 acres, 7 of which are under Fruit Trees; the whole is in a good state of cultivation with the usual crops, well supplied with water, at a low rent, and two miles from the London Markets.—For particulars, apply to Mr. SAMUEL BRANDON, Valuer, 32, Paradise Row, Rotherhithe; Mr. HOWARD, Valuer, Heathfield, Nine Elms; or Mr. HARWOOD, Surveyor, Stepney Green.

TO BE LET, an old established NURSERY, with neat Cottage, Greenhouses, Vinery, and other Buildings, with half an acre of Land.—Apply to Mr. COSSEY, Estate Agent, St. George's Middle Street, Norwich.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. FOX'S, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill

Illustrated Catalogues forwarded post free.

NURSERIES, CLAPHAM.

MESSRS. PROTHEROE & MORRIS are instructed by the Administrators of the late Jos. Fairbairn, to offer for unreserved sale, in the early part of September, the entire stock of specimen Greenhouse and Stove Plants, which are all of the most choice sorts, and in the best condition. The lease of the old established Seed Shop and Nursery to be sold; the Stock may be taken by valuation or by agreement: for particulars apply to the administrators, at the Nursery, Clapham, or to Mr. JAMES FAIRBAIRN.

POPULAR WORK ON BOTANY BY DR. LINDLEY.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14s.,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

BRADBURY & EVANS, 11, Bouverie Street.

Now ready, carefully revised and wholly reprinted, in One Volume, price 5s.,

HARD TIMES. By CHARLES DICKENS.

BRADBURY & EVANS, 11, Bouverie Street.

On the 16th of August will be published, price 5s. 6d.,

THE NINTH VOLUME OF HOUSEHOLD WORDS. Conducted by CHARLES DICKENS. Containing HARD TIMES, &c.

Office, 16, Wellington Street, North, Strand, and sold by all Booksellers and Newsvenders.

In post 8vo, a New Edition, with 405 Woodcuts, price 14s.,

CATLOW'S POPULAR CONCHOLOGY; or, the Shell Cabinet arranged according to the Modern System. With a Detailed Account of the Animals, and a complete Descriptive List of the Families and Genera of Recent and Fossil Shells. Second Edition, much improved.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Just published, New and Improved Edition, price 1s.,

THE CURABILITY OF CONSUMPTION. Being a Series of Papers, presenting the most prominent and important Practical Points in the Treatment of the Disease. By F. H. RAMADGE, M.D., Fellow of the College of Physicians, late Senior Physician to the Royal Infirmary for Diseases of the Chest, &c.

Also, by the same Author, price 10s. 6d.,

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

THE LATEST DISCOVERIES IN THE HOLY LAND.

This day is published, in two vols., 8vo, price 30s.,

SYRIA AND PALESTINE IN 1851-52: being a Narrative of a Journey undertaken specially with a view to the Elucidation of Biblical History. By C. W. M. VAN DE VELDE, late Lieut. Dutch Royal Navy. Two vols., 8vo, with Map of the Author's Route, Plan of Jerusalem, and other Illustrations, price 30s.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

This day is published, price 21s., Part III., of a New Edition of

THE PHYSICAL ATLAS. By A. KEITH JOHNSTON. To be completed in 12 Parts, at 21s. each.

The following Maps may be had separately:—

I.

A MORAL AND STATISTICAL CHART, showing THE GEOGRAPHICAL DISTRIBUTION OF MAN, ACCORDING TO RELIGIOUS BELIEF. By ALEX. KEITH JOHNSTON, F.R.S.E., &c., Author of "The Physical Atlas," &c. In Imperial Folio, beautifully printed in colours, with Explanatory Letterpress, price 10s. 6d.

II.

MAP OF THE DISTRIBUTION OF MARINE LIFE. By EDWARD FORBES, F.R.S., Professor of Natural History in the University of Edinburgh, President of the Geological Society. In Imperial Folio, beautifully printed in colours, with letterpress, price 10s. 6d.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

In One Volume 8vo, price 14s.

HISTORY OF THE FRENCH PROTESTANT REFUGEES, from the Revocation of the Edict of Nantes to the Present Time. By CHARLES WEISS, Professor of History at the Lycée Buonaparte. Translated, with the assistance of the Author, by F. HARDMAN.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

SIR ARCHIBALD ALISON'S NEW HISTORY.

THE HISTORY OF EUROPE, from the Fall of Napoleon to the Accession of Louis Napoleon.

The Third Volume, now published, contains:—Asia Minor, Greece, Turkey, in 1821. The Greek Revolution, Battle of Navarino, and Establishment of Greek Independence. The War between Russia and Turkey, 1827-1829. France to the Revolution of 1830. Domestic History of England to the Monetary Crisis of 1825, &c. Price 15s.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

SEBASTOPOL AND THE BLACK SEA.

Lately published, a Fourth Edition of

MR. OLIPHANT'S RUSSIAN SHORES OF THE BLACK SEA, including A VISIT TO SEBASTOPOL. Octavo, with 33 Engravings on Wood, an Enlarged Map of the Crimea, and Map of the Author's Route, &c. 14s.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

PROFESSOR JOHNSTON'S CHEMISTRY OF COMMON LIFE. Vol. I., price 5s. With 57 Illustrations, engraved on Wood by BRANSTON, &c. To be completed in Two Volumes.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

FOWLS.—By JOHN BAILY. Now in the press, and will be published, August 1, the Second Edition of the above work, with which is reprinted the fourth edition of "The Dorking Fowl," corrected, revised, and considerably enlarged. It contains descriptive tables of all the fowls now exhibited, giving in few words their chief points and qualifications, with copious rules for their selection and management. Price 2s.; by post, 2s. 6d.

JOHN BAILY, 113, Mount Street, Grosvenor-square, London.

ON MARRIAGE.

Just published (to be had free, by enclosing 1s. or Twelve Postage Stamps, to Mr. WATSON, Clerical Agent, Robert Street, Adelphi, London).

MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

THE FOLLOWING WORKS ARE ALWAYS ON SALE AT THE OFFICE OF THIS PAPER.

Price 5s. 6d. cloth,

SECOND EDITION, REVISED AND ENLARGED,

ORNAMENTAL AND DOMESTIC POULTRY; Their History and Management.

By the Rev. EDMUND SAUL DIXON, M.A., Rector of Intwood with Keswick.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden, London.

Third Edition, considerably enlarged, price 5s. 6d.,

RURAL CHEMISTRY. By EDWARD SOLLY, F.R.S., F.L.S., F.G.S., Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Hon E. I. Co.'s Military Seminary at Addiscombe, &c., &c.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

Price 1s. 6d., free by post 1s. 10d.

LABELS FOR THE HERBARIUM, CONSISTING OF THE NAMES OF THE CLASSES, ALLIANCES, ORDERS, AND SUB-ORDERS, OF PROFESSOR LINDLEY'S "VEGETABLE KINGDOM."

So printed in large type, that they can be cut out and pasted into THE HERBARIUM.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

Price 3d. each, or 5s. for 25 copies for distribution among Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the office of the *Gardeners' Chronicle*.

In consequence of the new postal arrangements, parties in the country who desire it can have copies sent by post; six stamps, in addition to the cost of the numbers, will pass 10 copies free by post.

The cost of a single copy, free by post, is therefore 7d.; and of ten, free by post, is 3s.

THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS. By Sir JOSEPH PAXTON.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—15th August, 1854.

NOTICE IS HEREBY GIVEN, that on and after the 29th inst., the Office of this Society will be removed to 14, Tavistock Row, Covent Garden, London, where all Letters and Communications are to be addressed.

E. R. CUTLER, Secretary.

A GRAND EXHIBITION OF HOLLYHOCKS, Open to the United Kingdom, will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on TUESDAY, August 22. A Subscription is now open for the purpose of raising a fund of sufficient magnitude to distribute Prizes to Nurserymen and Amateur Growers worthy the merits of this noble and popular flower. It is intended to offer a Silver Cup, value 5*l.* 5*s.*, to each class for spikes in flower, with valuable descending Prizes of Gold and Silver Medals. Cut Blooms also will receive their due share of attention. In addition to the above, Gold and Silver Medals will be awarded for Miscellaneous Collections of Stove and Greenhouse Plants, Specimen Plants, Dahlias, Roses, &c.

COMMITTEE.—Messrs. W. Barnes, Peckham; J. W. Bircham, Bungay; W. Bragg, Slough; W. Chater, Saffron Walden; W. Paul, Cheshunt; A. Parsons, Ponder's End; Roake, Clewer; and C. Turner, Slough, by whom subscriptions will be received, also by the Secretary. Lists of Prizes, with Rules of the Exhibition, may be obtained of the Secretary, J. T. NEVILLE, Ebenezer House, Peckham.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY.—The annual Autumn Exhibition, to be held at the ROYAL PAVILION, Brighton, on WEDNESDAY and THURSDAY, Sept. 13 and 14.

President.

HIS GRACE THE DUKE OF DEVONSHIRE.

Vice-Presidents.

His Grace the Duke of Richmond, Lord Lieut. of county.
His Grace the Duke of Norfolk, E.M.
The Most Noble the Marquess of Bristol.
The Right Hon. the Earl of Chichester.
Admiral Sir G. B. Pechell, Bart., M.P.
Lord Alfred Hervey, M.P.
The Hon. Hanbury Tracy.
The Hon. A. Macdonald.
The Baron de Goldsmid. [R.N.
Rear Admiral Sir G. Westphall, &c., &c., &c.

Upwards of 270*l.* are offered as Prizes (including the RAILWAY CUP, value 10*l.*, offered for the best 24 dissimilar Dahlia Blooms), schedules of which can be obtained of the Secretary, among which will be found the following, viz.:—Orchids, 8 vars., 8*l.*, 5*l.*, 3*l.*; Stove and Greenhouse, 8 vars., 8*l.*, 5*l.*, 3*l.*; Device—Cut Flowers, 5*l.*, first prize; Collection of 8 Dishes Fruit, 7*l.*, 4*l.*, 3*l.*, 2*l.*

The Band of the Coldstream Guards (by permission of Col. the Hon. A. Upton), will attend each day, conducted by Mr. Godfrey; also the Military Band from the Garrison, under the direction of Herr Daverow. The entire suite of Rooms and eastern lawn will be thrown open for the occasion.

Through the liberality of the Directors of the London, Brighton, and South Coast Railway, the Committee have the pleasure to announce to the Exhibitors that all Plants, &c., for Exhibition, will be conveyed to Brighton from all stations, and back whence they came, Free of Charge.

General Superintendent of the Exhibition, Mr. E. Spary.

EDWARD CARPENTER, Secretary.

Brighton, Aug. 19, 1854.

N.B. All communications to be made to the Secretary. Address, 45, Lavender Street.

SALISBURY GRAND ANNUAL DAHLIA EXHIBITION, open to all England, will take place at Milton Park, on Thursday, the 31st August, 1854, when Silver Cups and Plate will be awarded as under.

FIRST CLASS.—Amateurs, 24 blooms: Prizes, 7*l.* 7*s.*; 5*l.* 5*s.*; 3*l.* 3*s.*; 2*l.* 2*s.*; 1*l.* 1*s.*; 10*s.*

SECOND CLASS.—Amateurs, 12 Blooms: Prizes, 5*l.* 5*s.*; 3*l.* 3*s.*; 2*l.* 2*s.*; 1*l.* 1*s.*; 15*s.*; 10*s.*

THIRD CLASS.—Amateurs, 12 blooms, Fancy Flowers: 2*l.* 10*s.*; 1*l.* 10*s.*; 1*l.*; 10*s.*

FIFTH CLASS.—Seedlings, 1853, 3 blooms: Certificates.

SIXTH CLASS.—Seedlings, 1854, single bloom.

RULES AND REGULATIONS.—Flowers to be ready for the umpires as soon as possible after the first train from London. The flowers to be shown in the grower's own stands, which must be the same as the Metropolitan Society's. All entries to be made by the 28th of August. No entrance allowed after the 28th. Entrance for First, Second, and Third Class, 10*s.* each; Fourth, Fifth, and Sixth, 2*s.* 6*d.* No competitor to show unless he sends a letter containing a Post-office order, to the amount of his entries, to the Secretary, which letter shall be produced, if required. No growers that have sold green plants of Dahlias, whether Seedlings or otherwise, will be eligible to show in Classes One, Two, or Three. Prizes will only be given to two-thirds of the entries in all classes. All communications to be directed, post paid, to JOHN KEYNES, Salisbury, Honorary Secretary,

N.B.—No Prizes offered to Nurserymen.

NATIONAL DAHLIA EXHIBITION, under the auspices of the Nottingham Horticultural Society, will be held in Nottingham, together with the Fourth Exhibition of the Nottingham Horticultural Society, on WEDNESDAY, the 13th September, when five Silver Cups and numerous other prizes will be awarded.—Schedules may be had by enclosing a postage stamp to S. R. P. SHILTON, Honorary Secretary, Nottingham.

CHICHESTER HORTICULTURAL SOCIETY.—The Autumn Exhibition will be held on THURSDAY, August 31, by the kind permission of the Lord Bishop, in the Gardens of the Episcopal Palace, when, in addition to the usual Premiums, Prizes of 3*l.*, 2*l.*, and 1*l.*, Open to all England, are offered for HOLLYHOCKS, 12 varieties, in spikes. Entrance, 10*s.*

The Band of the Royal Marines will attend.

HENRY SILVERLOCK, Jun., Secretary.

GREAT BOTANICAL AND HORTICULTURAL MEETING AT THE BOTANICAL AND HORTICULTURAL SOCIETY'S GARDENS, MANCHESTER, on the 13th, 14th, 15th, and 16th of September, 1854. The Council of the Manchester Botanical and Horticultural Society, have arranged to open their NEW GLASS PROMENADE, covering an area of 1000 square yards, with a grand Botanical and Horticultural Exhibition. The articles to be exhibited will comprise Plants and Flowers, Fruits and Vegetables, Dried Flowers and Fruits, Wax Flowers and Fruits, Fountains and Vases, Flower-pots and Baskets, Garden Stands and Seats, Labels for Plants, Nets and Mats for covering Trees, Statuary for Garden decoration, Iron and Wirework for Garden purposes, Garden Implements of all kinds, with every other article connected with Gardening. Schedules are in course of preparation, and may be obtained on application to the Secretary.

By order, JOHN SHAW, Secretary.

Council Room, 40, Princes Street, Manchester, Aug. 19.

HELIOTROPIUM, "BEAUTY OF THE BOUDOIR," 5*s.* each, or six Plants for 21*s.*

The above Plants are now ready for distribution; they are both the finest in their class, and possess very useful qualities. The descriptions of them, and the following, can be seen in the Catalogue of MESSRS. E. G. HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, which will be forwarded post free, on application.

The new French Spotted Geraniums, 5*s.* and 7*s.* 6*d.* each, according to size. The five new bedding Calceolarias, 31*s.* 6*d.*

LISIANTHUS RUSSELLIANUS.

J. AND J. FRASER beg to offer the above, in strong and healthy plants, such as will make large specimens for flowering next season, at 2*s.* 6*d.* each.

Lea Bridge Road, Essex, August 19.

CHRYSANTHEMUMS.

J. AND J. FRASER have a very superior Collection of the above, comprising the newest and best of Large-flowering and Lilliputian varieties. The plants are very strong, and will bloom well in the ensuing winter.

Lilliputians, fine plants ... ... 9*s.* to 12*s.* per doz.
Large flowering ... ... 9*s.* to 12*s.* "
New French varieties of 1854, not yet bloomed in this country ... ... 18*s.* "

Lea Bridge Road, Essex.—August 19.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's collection at 9*s.* per dozen. A list of names forwarded upon application.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Established plants, in 3-inch pots, at 3*s.* per dozen.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out new seed of this year's saving, which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each; also a few packets of choice Cineraria Seed at 1*s.* 6*d.* and 2*s.* 6*d.* each; Primula sinensis, all saved from fringed flowers, 1*s.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.—Aug. 19.

CALCEOLARIA SEED.

MR. HENRY MAJOR, Knowsthorpe, near Leeds, begs to announce that his new CALCEOLARIA SEED of this season is now matured, and may be had in packets at 2*s.* 6*d.* each, or 3 packets for 5*s.*, post free. The Seed has been produced from rich and beautiful varieties, for which his collection stands unrivalled, and therefore Seedlings possessing good and beautiful properties may reasonably be expected. The present, up to the end of this month, is a proper time to sow for insuring an early spring bloom. Postage stamps are respectfully requested in payment of the Seeds.

GRASS SEEDS.

SUTTON AND SONS *recommend the sowing of* GRASS SEEDS *during the month of August for permanent pasture, and are now prepared to supply excellent fresh Seeds for the purpose.*

Also New Italian Rye Grass and Trifolium incarnatum, at moderate prices.—JOHN SUTTON & SONS, Seed Growers, Reading.

PELARGONIUMS.

J. DOBSON AND SON beg to announce that their annual descriptive Catalogue of the above, containing full descriptions of the best varieties of Beck's, Foster's, Hoyle's, and other raisers, at reasonable prices, may be had on application.

Woodlands Nursery, Isleworth.

NEW PELARGONIUMS.

J. DOBSON AND SON beg to call attention to the advertisement in this Paper of Saturday last, which contains a full description, with prices, of Beck's and Fuller's new and beautiful Seedlings, to be sent out the first week in October.

Woodlands Nursery, Isleworth.

LILIUM LANCIFOLIUM, TRITONIA AUREA, AND VALLOTA PURPUREA.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to say that he has an extensive collection of the above BEAUTIFUL BULBS coming into flower, which may be viewed every day (Sundays excepted). Admittance gratis.

STRAWBERRY PLANTS.

CHARLES KIMBERLEY has a large stock of the following to offer at 3*s.* 6*d.* per 100:—Keens' Seedling, British Queen, Hooper's Seedling, Elton Pine, Princess Alice Maude, Stirling Castle Pine, and Comte de Paris.

Stoke Nursery, near Coventry.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy. RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILEBASKET, do. 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, August 19.

LOCKSBROOK NURSERY.

R. SHACKELL has strong plants of his Russian Superb Violet, now in excellent order for potting, at 4*s.* per dozen. Double Purple Perpetual Tree Violet, at 3*s.* per doz. Neapolitan Violet, at 3*s.* per dozen. Other varieties at low prices; hamper included, if the order be above 5*s.* It is requisite to pot the Violet early to insure a good display of bloom through the winter months.

ROBERT SHACKELL, Florist, Lockebrook Nursery, Bath.

RHODODENDRON JAVANICUM.

A. VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to offer good Seeds of the above, just gathered, at 7*s.* 6*d.* and 15*s.* per packet, containing about 2000 and 4000 Seeds.

A. V. G.'s stock of CAMELLIAS and INDICA AZALEA is well set with bloom, at very moderate prices.

A reference from unknown correspondents. Catalogues may be obtained from his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Tower Street, London.

HOLLYHOCKS.—A collection of this fine old English flower, grown at the Cheshunt Nurseries, is now in bloom, and there will be a succession till the end of October. Admirers of the Hollyhock are respectfully invited to visit the Nurseries to inspect them. In addition to the choicest varieties of other growers, there are many rare and beautiful kinds of their own production, and to be seen only at their grounds.—A. PAUL & SON, Nurseries, Cheshunt, Herts (13 miles from London, on the Cambridge line of Eastern Counties Railway).

STANDISH & NOBLE'S Catalogue for the present season is now ready, and may be had by inclosing two stamps for postage.—The Nursery, Bagshot, August, 1854.

WANTED to PURCHASE Four or Five large CAMELLIAS, 4 to 5 feet high, and well set with flower buds. Also, the same quantity of AZALEAS, about the same size, likewise well set with flower buds; the whole must be good showy kinds.—Applications, with lowest price, to be addressed to Mr. WARD, South Villa, Regent's Park.

NEW FUCHSIAS, VERBENAS, AND PETUNIAS OF 1854 AT REDUCED PRICES, with other NEW and SELECT PLANTS.

For BASS AND BROWN'S Advertised Lists of the above, see *Gardeners' Chronicle* of July 22 and 29, and August 5.

SUPERB NEW CHRYSANTHEMUMS.

12 best new Pompone varieties of last season ... ... 12*s.*
10 best new large flowering do. do. ... ... 10*s.*
60 splendid varieties of Pompone and large flowers, including new, 40*s.*, or, per dozen ... ... 9*s.*

These are all fine and strong for flowering.

Catalogues free for three penny stamps. Post-office orders payable to BASS & BROWN, or to STEPHEN BROWN, Post Office, Sudbury, Suffolk.

CHOICE NEW FUCHSIAS, &c.

SAMUEL STAFFORD, NURSERYMAN, Hyde, near Manchester, begs to offer clean healthy plants of the NEW FUCHSIAS of 1854, most of them strong in 36-inch pots, as under:—Fuchsia Duke of Wellington, Autocrat, Charmer, Vanguard, Queen of Hanover, Elegans, Omega, Clio, Magnifica, Macbeth, Othello, Monarch, Trentham, Fanny Webb, Standish's Perfection, Telegraph, Henry Monteith, Globosa splendens, Grandissima, Mr. C. Palmer, and Admiral, 2*s.* each, or 12 for 20*s.*

Last season's sorts, 9*s.* to 12*s.* per dozen.

Choice selections of Herbaceous and Alpine Plants, 25*s.* per 100.

He is also prepared to send his very superior Calceolaria Seed, raised from the finest strains, carefully crossed, 2*s.* 6*d.* per packet.

Lists of the above, and other Nursery Stock, may be had on application.

WARD'S "OMER PACHA" STRAWBERRY.

W. J. WARD (by permission of his employer, W. Stephens, Esq.,) offers to his friends and the public the above Seedling Strawberry, which has been proved to possess superior excellence. It is a large handsome fruit, intermediate between the old Carolina Pine and British Queen, partaking of the fine colour of the former, and by many considered superior in flavour to the latter; it is also remarkable for the fine buttery quality of its flesh. Great bearer; ripe as early as Keens' Seedling, affording a long succession of fine fruit. It was exhibited at the Royal Botanic Gardens, Regent's Park, on Wednesday, the 5th of July, and obtained the Bronze Medal. It has also been submitted to Mr. Marnock, Regent's Park, London; Mr. Thompson, Horticultural Society, Chiswick; and Mr. Spencer, Bowood, all of whom speak highly favourably of it. Also the following, who have pronounced it first-rate, and are open to take orders for it:—Messrs. Henderson, Pine-apple Place, London; Mr. C. Turner, Royal Nursery, Slough; Messrs. Standish and Noble, Bagshot; Mr. P. Lydiard, Fruiterer, Bath-easton, Bath; Mr. W. J. Epps, Bower Nursery, Maidstone; Messrs. Sutton, Reading; Mr. W. Barnes, Camberwell; Mr. Lewis Solomon, Fruiterer, Covent Garden.

Strong well rooted plants last week in August. Terms, cash or reference.—100 plants, 3*l.*; 50 plants, 1*l.* 15*s.*; 25 ditto, 1*l.* A few strong plants in 32-sized pots, 15*s* per dozen.

Prospect Hill, Reading, August 19.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefoha, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barres' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, August 19.

"SIR HARRY."—The eminent success of this new SEEDLING STRAWBERRY, at the only Floral and Horticultural Exhibitions where it has been shown, viz., Chiswick, first-class Certificate; 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize—induces the proprietor (hitherto an amateur grower only) to offer it for sale.

The characteristics of the plant are these:—Ripening as early as Keens' Seedling, but continuing fruiting a much longer time—a great cropper, bearing a very large handsome dark crimson berry, which carries that superb colour not only quite through but to its very end, whilst, being both firm and juicy, it separates itself entirely from its calyx, without having a tasteless core. The delicious and luscious flavour of the fruit, united with its high perfume, throws utterly into shade the Keen and British Queen. The leaves are few, and the vigorous extension of its bearing branches exposes the fruit to the ripening influence of the sun, the want of which exposure is a great cause of failure in many sorts of this class of plant.

An oil-painting of a one-year-old runner, with its gigantic fruit in the respective stages of growth (as sketched from nature), is now to be seen in the Birmingham Exhibition of the Society of Artists, and coloured Lithographs have been taken from it by an eminent London Artist, which may be had on application, price 2*s.* 6*d.* each, in postage stamps.

The Plants will be ready for sending out (not less than a score) on the 20th September next. Prices—100 plants, 6*l.*; 80 plants, 5*l.* 10*s.*; 60 plants, 4*l.* 4*s.*; 40 plants, 2*l.* 17*s*; 1*l.* 10*s.* for a score. A few plants in pots may be had. Apply to MR. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham; each application to be accompanied with a Post-office order (on Birmingham) or cash, to receive attention.—August 1854.

WILLIAM BARNES begs to call the attention of his friends and the public generally to his general stock, which will be found to contain the greater part of the very best things in cultivation.

CHINESE AZALEAS, all the best varieties that have been sent out up to the present time, great care having been taken in the growth of this beautiful family of plants, all the weak delicate growing varieties being selected and worked upon strong healthy stocks, and the plants are such as are rarely to be met with for health and vigour, and will bloom fine next season.

GERANIUMS, all the best fancies, large flowering kinds, and bedding, as well as the following variegated varieties, viz., Flower of the Day, Mountain of Light, Golden Chain, Silver Queen, Silver King, Attraction, Lady Cottenham, Brilliant, and Cupped Leaf.

Also the finest varieties of Delphiniums, French and Belgian Phloxes—many of them may now be seen in bloom.

Perpetual Blooming Carnations, fine plants that will bloom through autumn and winter in great variety.

All the new French and English Verbenas, fine strong plants.

Chrysanthemums, Pompons, and large flowering varieties; newest and best fine strong bushy plants.

Roses on own roots, comprising the newest and most approved kinds of Hybrid Perpetuals, Bourbons, Teas, Chinas, Noisettes, Hybrid Chinas, and Hybrid Bourbons. These have all been kept shifted into larger pots, and are now very fine strong healthy plants. Japan and other Liliums, of which W. B. has a very large stock, both in beds and pots.

A very fine selection of all the most approved kinds of Vines from eyes in pots, among them some extra strong plants of Black Barbarossa.

Antirrhinums, Pentstemons, Petunias, Heliotropiums, Lobelias, Fuchsias, and fine plants of Hydrangea japonica variegata.

Fine new Mushroom Spawn.

An inspection of his Stock is respectfully solicited.

N.B.—Catalogues can be had on application.

Camden Nursery, Camberwell, London, Aug. 19.

THE BEST PLANT OF THE SEASON.
"BEGONIA PRESTONIENSIS SUPERBA."

W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr Frost, Gardener to E. L. Betts, Esq, Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with stamens and petals, resembling a double blossom with a golden tinge, exhibiting a charming contrast The flowers are delightfully fragrant as a Tea-scented Rose. Habit—dwarf and bushy; the flowers are thrown well above the foliage, in large trusses, and altogether one of the best plants yet offered. It received the highest award in June, at the Royal Botanic Show, Regent's Park, as a new plant; also at Maidstone and Ashford. Plants in October, 10*s.* 6*d.* each; one given where three or more are taken.—Bower Nurseries, Maidstone, Aug. 19.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind; it is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2*s.* 6*d.* per packet, postage free (or penny postage stamps to the amount).

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

NEW FUCHSIAS OF 1854.

JOHN MOORE AND SONS, having a fine stock of their "Duke of Wellington," beg to offer good plants in bloom on the following terms, viz.:—

	s.	*d.*
One Duke of Wellington and two others, selected from the following	10	6
One do. and 6 do.	20	0
One do. and 12 do.	35	0

Hamper included.

Clio, Omega, Elegans, Charmer, Vanguard, Autocrat, Magnifica, Queen of Hanover, Trentham, Fanny Webb, Telegraph, Henry Monteith, England's Glory, Duchess of Lancaster, Glory, Lady Franklin, King Charming, and Incomparable.

Blooms of most of the above can be sent per post, on receipt of 12 stamps. A liberal discount to the Trade.

Perry Barr Nursery.—August 19.

WILLIAM KNIGHT, FLORIST, 67, High Street, Battle, Sussex, offers the following SELECT FLOWER SEEDS, for present sowing, sent post free at the annexed prices:—Cineraria, extra fine, 6*d.*; Calceolaria, fine spotted varieties, 1*s.*; Hollyhock, from named flowers, 6*d.*; Mimulus, from 12 varieties, 6*d.*; Sweet William, from 50 varieties, 6*d.*; Pansy, extra fine, 6*d.*; Double Daisy, fine, 6*d.*; Antirrhinum, from 50 varieties, 6*d.*; 12 varieties choice hardy Perennial Seeds from America, extra fine, 2*s.*

CHOICE SEEDS.—Splendid mixed Sweet William, Antirrhinum, Primula sinensis fimbriata, Calceolaria, and Cineraria, Chater's Hollyhock, 1*s.* and 2*s.* 6*d.* per packet. Can be strongly recommended; saved only from the best flowers. Catalogues free by post.

DAWE, COTTRELL, & BENHAM (successors to F. Warner), Seedsmen, 36, Moorgate Street, and 3, Laurence Pountney Lane, City, London.

Agents for Butcher's Barbarossa Vines, M'Adam's Anti-Grape Blight Composition, and Cole's Concentrated Animal Manure.

STRAWBERRY PLANTS.—The best varieties for early and late growing which have been thoroughly proved and given every satisfaction are the undermentioned first-rate varieties, now ready.

Nimrod, 15*s.* per 100; Ajax, 5*s.*: Ruby, 5*s.*; Prince of Wales, 10*s.*; Trollope's Victoria, very superior, 5*s.*; Myatt's Surprise, 3*s.*; Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 3*s.*; British Queen, true, 3*s.*; Alice Maude, 3*s.*; Black Prince, very early, 3*s.*; Eliza, 3*s.*; Prolific, very fine and early, 3*s.*; Cremont's Perpetual, or Double-bearing Strawberry, 3*s.*

A remittance must accompany the order, either by Post Office Order or Penny Postage Stamps, on receipt of which the plants will be sent in hamper and package free, for all orders above 5*s.*

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

CHRYSANTHEMUMS, &c. — The following we consider the best and most distinct varieties at present in cultivation, and are a careful selection from our large collection, and beg to offer them at 9*s.* per doz.

CHRYSANTHEMUMS (large-flowering varieties) at 9*s.* per dozen, viz., Nell Gwynne, Rosa Mystica, Poudre d'Or, Rebecca, Madame Laborde, Norah, Rosée du Ciel, Berryer, Madame Dervaux de Lavarde, Mimosa, Osiris, Madame Andry, Ondine, Jenny Lind, Racine, Baron de Solyman, Atrorubens, Marshal Ney, Arc en Ciel, The Warden, Nonpareil, Bixio, Christine, Ender, Dupont de l'Eure.

CHRYSANTHEMUMS (Pompone and Lilliputian varieties), at 9*s.* per dozen, viz., Drine Drine, Nelly, Cedo Nulli, La Vogue, Alveeflorum, Caroline Gignoux, Sathaniel, Argentine, Princesse Mathilda, Atropos, Daphne, La Sapagon, Vitida, Lais, Mignonette, Madame Rousselon, Solfaterre, Adonis, Cybele, Iris, Model, Zenobia, La Gitana.

PHLOXES—The following new and beautiful varieties, at 9*s.* per dozen: Striata Superba, Alexandrina, Mrs. Thompson, Maria Vincent, Madame Doublet, Aricie, Nimrod, Deuil de la Comtesse de Marnes, Bois Rose, Roi Leopold, Spenceri, Villaret, Joyeuse, Princesse Marianne, Napoleon, Madame Poivra, Madame Courcelles, Macrantha, Madame Lierval, Imbricata, Eliza, Anais, Diadem, Maria Boulanger, Madame Henderson, Rubra, Nelsoni, Madame Lanier, Rio des Roses, Madame des Princes.

TREE CARNATIONS, in 12 fine and distinct kinds, for Autumn and Winter blooming, 18*s.* per doz.

For particulars of Choice Greenhouse Plants, Gloxinias, &c., see their advertisement of August 8.

Orders of 2*l.* and upwards are delivered Carriage Free to any Railway Station within 150 miles of the Nursery.

YOUELL & Co., Royal Nursery, Great Yarmouth.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO MR. RIVERS, and of various dimensions, always on hand.

London Agents for the Sale of HARTLEY'S PATENT ROUGH PLATE GLASS.

Glass Tiles, ½ of an inch thick, packed in cases, containing 50, at 1*l.* 17*s.* 6*d.* per case. Packages 2*s.* each extra, but allowed for when returned.

Glass Milk Pans, 21*s.* per dozen; Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

ENCAUSTIC TILE PAVEMENTS.

MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.

Specimens at 11, Aldersgate Street, City.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Journal of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched in October. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, August 12.

WELLINGTONIA GIGANTEA.

MESSRS. VEITCH AND SON beg to inform the Public that they have only a limited number of their FIRST LOT OF SEEDLINGS of the above splendid HARDY EVERGREEN TREE left on sale. They would therefore recommend those parties requiring STRONG PLANTS to make EARLY application. Terms AS IN FORMER advertisements.

Messrs. V. & SON beg at the same time to intimate to THE TRADE that they have a second raising of nice healthy young plants in small pots, which they can offer to them on terms varying with the quantity taken, and particulars of which can be had on application.

Nurseries, Exeter and Chelsea, Aug. 19, 1854.

MAY'S PARAGON CABBAGE.—Prepaid postage. The above superb CABBAGE can still be had in 1 oz. packets, 1s. each. Sow July and August.

Also new CINERARIA SEED from the best named flowers, in packets, 2s. 6d. each.

Address, HENRY MAY, the Hope Nurseries, near Bedale, Yorks.

BASS AND BROWN are now saving several of their choice Seeds, and can strongly recommend the following, which have been selected with their usual care from their superb collection:—

CALCEOLARIA, very choice, 1s.; extra superb ...	2s. 6d.
CINERARIA, very choice, 1s.; extra new and choice	2 6
FUCHSIAS, from new and choice	1 0
GERANIUM, very choice, 1s; extra new and choice	2 6
,, from finest fancy varieties	1 6
GLOXINIA, fine, 6d. extra from new and choice ...	2 6
ANTIRRHINUM, choice, 6d. extra from superb flowers	1 0

A List of Choice Seeds selected for Autumn sowing may be had free by post on application.

Post-office orders to be made payable to BASS & BROWN, or STEPHEN BROWN. Penny stamps received for small amounts.

Seed and Horticultural Establishment, Sudbury, Suffolk.

BULBS FOR CHRISTMAS FLOWERING.

J. CARTER, 238, High Holborn, London, begs to inform his Customers, and the Public in general, that he has already received a supply of the following BULBS for early flowering, viz.:—

HYACINTHS, double and single, in 6 sorts,	per doz.	8s. 0d.
POLYANTHUS NARCISSUS, in 6 sorts	,,	5 0
Double Roman do.	,,	3 0
Paper-white do.	,,	3 0
JONQUILS, largest double	,,	2 0
Do. sweet scented, single	,,	1 6
TOURNESOL TULIPS, early	,,	2 0
VAN THOL TULIPS, double or single ...	,,	1 0
SNOWDROPS, double or single ...	per 100	2 0
CROCUS, various	,,	1 6

A comprehensive Catalogue of Dutch and Cape Bulbs will be forwarded gratis, and prepaid to all regular customers as usual, in a few days; and the same may be had by applying, by post or otherwise, to

JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

*** The Catalogue comprises a List of Seeds proper for present and autumn sowing.

The Gardeners' Chronicle.

SATURDAY, AUGUST 19, 1854.

ADVICES, dated July 19, have been received from J. GIFFARD, Esq., Her Majesty's Consul at Vera Cruz, announcing the arrival in that city of Mr. BOTTERI, the new collector of plants for the Horticultural Society; and of the departure of that gentleman for Orizaba, by way of Cordova. Consignments of plants and seeds may, therefore, be now expected in a few weeks.

IF any one fruit tree has occupied the attention of cultivators more than another, it is surely the PEACH. Endless dissertations and directions about it are to be found in every gardening library—volume upon volume, by gardeners, by amateurs, by physiologists, from LONDON and WISE up to DU PETIT THOUARS and ANDREW KNIGHT, have contributed to its fame, and dwelt upon the difficulties of its treatment; and if there is such a thing now-a-days as a badly managed Peach tree, it is not the fault of authors and publishers. If there *is* such a thing! Where is there *not* such a thing? There is not a country village which is not full of melancholy instances of failure; some trees running to wood, others chlorotic and starved; some devoured by mossiness—others dying of gum and exuberance; none healthy, and all cursed with barrenness.

The reason of this is, undoubtedly, that the Peach tree is too tender for our climate, and can only be retained in health by care and skill. Our summers are too sunless—our soil too damp and cold. By no art can we give it sun enough—by small mistakes we give it far too little, and the temperature of the soil is hardly thought about. Of course we allude to the majority of places, and not to those which are managed by men of skill and intelligence. When the tree becomes unhealthy and unproductive, men never think upon simple common sense explanations of failure, but run to books, perplex themselves with complicated directions, half understand them, try to carry them out, and inevitably fail. In matters horticultural there are martinets as well as in matters military; and many a gardener practically falls into the error of supposing that the goose step, a tight jacket, leather stock and pipe-clay, make the soldier. As to the Peach tree, he measures its angles, pinions its limbs, drills its branches by inexorable rules, cuts hard in, lays in close, and then cries, "See what a tree have I made!" The tree looks well perhaps, but a small matter makes it ill, limb after limb dies away, fruit does not set, and all its spruceness ends in rags and tatters.

This comes of neglect of first principles. Not that we would undervalue in the smallest degree the rules which long experience have established; quite the contrary. It is because, if it is observed without intelligence, and without a thought to first principles, that mere routine, however excellent, is so apt to lead to failure. And we run no risk of contradiction when we venture to assert that in managing such an exotic as the Peach tree, it is better to understand principles and to be ignorant of rules of practice, than to be familiar with the latter and unacquainted with the former.

Since there are so many guides to the art of torturing Peach trees, let us endeavour to explain in what that which we presume to call its rational management consists.—1. First and foremost comes that greatest of all causes of success and failure in cultivation, the soil. The Peach tree abhors a cold soil when growing; it cares little about winter cold provided its roots are not in water; but in summer it must have earth to grow in more dry than wet; such as will permit rain to pass freely into it, *and as freely out*. By that means alone can sufficient warmth be secured in England.—2. In the next place its wood *must* ripen thoroughly; an operation much facilitated by a dry warm soil, and rendered impossible by one in an opposite condition. Everything that interferes with the ripening process is fatal to success. A rich border, for instance, forces the plant into such vigour that its wood never acquires that solid consistency which we call ripeness; therefore all substances similar to animal manures require to be carefully excluded. Neither, be the border what it may, will the wood ripen unless it is nailed close to the wall, so as to take the utmost advantage of absorbed as well as reflected and direct sun heat; hence the necessity of preventing the formation of what is called breast-wood, which keeps off the sun, which is of such vital importance to the tree.—3. The fruit is only produced on the wood of the second year. New wood yields nothing; wood in the third year produces nothing.

On these three simple principles everything turns. It is perfectly useless to perplex oneself with rules for training unless these fundamental truths are remembered. All good practice depends upon them. Such practice as does not is better neglected than observed; it is either false or useless.

We are led to these remarks by a little book written by Mr. HENRY COX,* who, as a practical man, has filled up the details of what we have merely sketched. Although there is nothing in it, or in the previous remarks, of which a great gardener requires to be reminded, there is no doubt that a large proportion of the horticultural world forgets, if it ever thought about, the principles we would now inculcate, and which this author applies. His little book may, therefore, be consulted with advantage by everybody who fails, or succeeds but imperfectly, in Peach culture, and who does not want to learn the ordinary routine of fan training, or Seymour training, or horizontal training, or zigzag training, or any other scheme of training which ingenious persons may have invented. What he says is perfectly true: "It matters little what system of training be adopted, provided a good supply of well-ripened bearing wood be kept in every part of the tree, and its strength as nearly balanced as possible." To be sure. In a climate which suits the Peach, people do without training of any kind. Peaches are orchard trees in the United States; and if we train them to walls in Europe, it is chiefly because it is in that way only that we have a chance of approaching the summer heat of the States.

THE following details respecting the VINE MILDEW have been received from one of the most intelligent wine merchants at Oporto, who has made an especial study of everything connected with the growth and disease of the Vine, without, however, pretending to more than would present itself to the notice of a person free from prejudice, but on the watch for anything that might throw light upon the matter, and desirous of imparting accurately the knowledge he may have acquired. His observations are as follows:—"I still maintain the opinion that the disease is not in the root. With very few exceptions the Vines are covered with bright green leaves and with healthy young wood—that is, strong wood—but they are stained with black blotches, even to the tips of the tendrils.

"The same eccentricity prevails in the progress of the disease as was observed last year. Some of the Grapes are already putrid, while, in others, part of the bunch has withered, and the remainder is ripening. On some Vines half the fruit will be lost, and the other half saved. In some of the vineyards half the Vines are much blighted, and the other half *apparently* untouched. In the heights and the valleys, as in last year, the Grapes have all perished; and on the inclines the heat seems to do more harm than the wet of last year. The whole of Portugal is in the same state, and I believe that there is not a single Vine in the whole country which is not suffering under the blight.

"In my garden all my Potatoes were lost in one night; my Roses shared the same fate, Artichokes, Cucumbers, Melons, Pumpkins, all alike were affected, and the agricultural interests of this unfortunate country run the risk of being all but annihilated; I have not a single bunch of Grapes in Quintas farmed by me, and which ought to give me 300 pipes of the finest wine, which is not seriously affected by the disease. From these estates I shall be glad if I gather 50 pipes of ordinary stuff, merely to pay part of the costs.

"If the heat continues—and it has already putrified many Grapes—much further loss will ensue; and should the rain come about the time of vintage, which, of course, is to be looked for after the season of drought, hardly a bunch of Grapes will escape." *M. J. B.*

WE learn from the *Tuinbouw Flora* that the Dutch have succeeded in fruiting the JAPANESE APRICOT, called by botanists *Prunus* (or *Armeniaca*) *Mumè*. A coloured figure in the same work gives so good an idea of the plant that, as an undoubtedly distinct species of hardy fruit tree, the time has arrived for bringing it into notice in this country.

The first account we have of this Eastern fruit is to be found in KÆMPFER, who calls it *Bai*, or *Umè* and *Umè bos*. He calls it a wild spiny Plum with a large fruit, and adds that the fruits preserved in the lees of *sacki* or Japanese beer (Cerevisia japonensis), are exported to India and China. In 1835 SIEBOLD and ZUCCARINI, in their work on Japanese plants, entered into particulars. We give the substance of the statement made by these authors, who call the plant *Mumè*, and give *Bai* as its Chinese name. "The Mumè is found through all the empire of Japan, but thrives best in the northern parts, where it grows 15 or 20 feet high, and much resembles an European Apricot tree. When wild or planted in hedgerows it is a close branching bush, from 8 to 12 feet high. It is much cultivated for the sake of its flowers as well as its fruits. In good seasons the tree is in flower in the beginning of February, and is then used for decorating the altars and dwellings of the Japanese, as a symbol of the return of spring. In the wild plant the flowers are white; when cultivated they vary through every shade of rose and red, even becoming greenish or yellowish. Those most highly valued are the double sorts, which are used for dwarfing as well as for planting in gardens. Several hundred such varieties were collected in the garden of the Prince of TSIKUSEN. The fondness of the Japanese for dwarf trees is well known, and this Mumè is one of the plants most used for the purpose. In 1826, a dealer offered for sale a specimen in flower which was scarcely 3 inches high. This marvel of gardening was growing in a little red varnished box of three stages, like the drug-boxes which the Japanese carry at their belt. The upper stage was occupied by the little Mumè, the middle stage by a Spruce Fir equally small, and the lowest stage by a Bamboo not more than an inch and a half high. As for the fruits, they ripen in June; when quite ripe they are insipid, for which reason they are salted down when green, like Cucumbers, and are eaten as a vegetable with rice and fish. Much, however, as they are esteemed by the Japanese, Europeans do not relish their sour bitter taste. They are usually coloured red, when salted, by adding the leaves of *Ocymum crispum* (a kind of curled Basil). The juice of the green fruit is taken as a refreshing beverage in fevers; and is regarded as indispensable to the preparation of the beautiful and delicate red dye prepared from the Safflower."

It will be seen from this account that we must not reckon the Japanese Apricot as a dessert fruit, unless in the form of a preparation like that of the Olive, for which it seems to be a Japanese substitute. We would therefore guard our readers against being seduced into the purchase of it by a fine-sounding name. From the figure in the "Tuinbouw Flora," the fruit would seem to have much resemblance to the little early Apricots which the French call *Alberges* — pale straw-colour, with a little salmon-red on one side and near the stone. But, although no hope can be entertained of its becoming of any value at table, it is very possible that it may become valuable as a stock for the cultivated Apricot. The climate from which it comes is very severe, and it is certainly a true Apricot. Therefore we have undoubted hardiness on the one hand, and a great constitutional similarity on the other. In the latter respect, it ought to be much better suited to the Apricot than the Plum stock—which is apt to disagree with its Apricot scion—or than the Apricot itself, which is too tender to be

* A Practical Treatise on the Cultivation of the Peach and Nectarine. By HENRY COX. 12mo. SIMPKIN.

buried underground in our wet and cold winters. As soon as the Mumè becomes cheap enough to be so employed, we would recommend it to the notice of the nurserymen. In the meanwhile let us guard the public against imagining that, because it is really an Apricot, it is therefore worth growing for dessert. Such value in horticulture as it possesses, beyond what is now suggested, is wholly confined to its effect as a tree that blossoms at the same time as the Almond.

WE learn from the foreign journals that Dr FISCHER, known to many persons in this country as the director of the Imperial Botanical Garden in St. Petersburgh, died in June last at the age of 73. He was a meritorious botanist, a skilful horticulturist, and an eager collector. For several years before his decease he had been relieved from the charge of the Botanical Garden; and we believe was latterly employed in the medical department of the Russian Government.

VEGETABLE PATHOLOGY.—No. XXXIII.

148. It was stated above that the effect of temperature is much modified by the condition of the air, and this is no less true of a depression of temperature than of an elevation. A frost which does little damage when the air is dry will be very hurtful where the contrary condition exists. In low situations, therefore, where the air is comparatively moist, frost will sometimes be highly injurious, when an elevation of a few feet at a few hundred yards' distance will prove a perfect protection. A singular instance of this occurred, as a consequence of the frost of April 24 and 25, 1854, at the village of Woodnewton, in Northamptonshire, which for years before the prevalence of railroads supplied Leicester with fruit, though some six-and-thirty miles distant. A small brook runs at the base of a gently sloping declivity, which nowhere rises to an elevation sufficient to entitle it to the name of a hill, even in a flat country. On the table land above the trees were loaded with a profusion of Cherries, having entirely escaped the frost, while those a few feet lower, on the banks of the stream, suffered so much that the crop was comparatively insignificant, the distance between the orchards being not more than 200 yards.

149. The constant drain of the juices of a plant by evaporation, the necessity of that evaporation, the structure of the tissues which admit of nothing which is not soluble, except by actual force or chemical corrosion, to pass through their tissues, and many other points of greater or less importance, indicate the absolute necessity of a proper proportion of moisture according to the exigences of the plant. If the loss by evaporation be not replaced by fluid imbibed by the spongelets, the plant must speedily perish; if the air is too much saturated with moisture, evaporation ceases, or is proportionately diminished, the fluid in the tissues stagnates, and speedily causes disease; or if, on the contrary, there is a deficient supply of moisture to the spongelets, while the air itself is saturated with moisture, the stomates perform the office of the spongelets, and, as in all abnormal actions, disease is pretty certain to ensue. Everything, in fact, points out the necessity of a strict balance being maintained; and as it is not always possible to insure this on a large scale, especially in open field culture, the cultivator can only wrap himself up in the consciousness of having done all in his power, and wait for more propitious times. Where, however, conservatory culture is in question, the skilful gardener has much under his control, and it is no less necessary for him to ascertain the degree of saturation of the air in his houses than it is to regulate the light and temperature.

150. Even under every advantage of light, heat, and a proper saturation of the surrounding air, a plant will not succeed unless the roots have a constant supply of fresh nutriment dissolved in fresh, and not stagnant water. If the soil is once in such a condition as to retain the water in too great quantities, chemical decomposition takes place in its component parts, producing sulphuretted hydrogen and other matters injurious to vegetation. It is on this cause probably, and an accompanying depression of temperature ill suited to the tender roots and young tissues, that the necessity of drainage principally depends, very few plants only being capable of supporting health or even existence under decidedly defective drainage, and when other elementary principles fail—as, for instance, when the light or heat are deficient, and the air fully saturated—the plant must become dropsical and perish. Some bulbs and tubers are able to bear excessive drought, because they are in the condition of seeds, their proper roots being dead, or only sufficient to keep up such a degree of moisture as may be necessary to support life, and the same may be said of many which at certain seasons are constantly immersed in water, and where no moisture can be imbibed except just so much as may be expended by the chemical actions which may be carried on in the body, since the surrounding fluid forbids all loss by evaporation. No cause of disease is more frequent in cultivation than defect of drainage, and none which requires more care or which is more within the power of the cultivator.

151. The presence of a certain portion of fluid, both in the animal and vegetable world, is absolutely necessary to life. The chemical actions connected with vital functions, and inseparable from them, cannot take place without the presence of moisture, and when once the tissues and their contents have been reduced to a state of perfect dryness, any restoration of fluid will not restore their original condition, and the whole will consequently be subject to mere chemical or mechanical laws. Some tissues, however, like certain animals which are wafted about with the dust, as the Emydyæ, are capable of enduring a very considerable degree of drought; and in consequence mosses, which have been dried for the herbarium, lichens exposed to a burning sun, bulbs and tubers in mud baked as hard as a brick, seeds that have been covered with sand at 140°, &c., will revive on the application of moisture; but it cannot be pretended that, in these cases, every particle of free moisture has been expelled. The hardest tissues, so long as life exists, contain some moisture, varying with circumstances, and any marked change of its proportions is equally fatal, though the phenomena exhibited by excess of moisture may be very different from those attending its diminution.

152. Where water holding in solution matters which easily admit of chemical change remains for a long time in cells, which are themselves readily acted upon, decomposition is sure to take place, and consequently one main end of many processes of vegetation is to get rid of every particle of water which is not absolutely necessary for the maintenance of vital action. In that portion of the wood, for instance, which has performed its more direct functions, a very slight quantity only of moisture is contained, and the ripening of seeds during the latter stages of development consists mainly in the absorption and evaporation of the fluids. Dr. Cohn* has lately made some experiments with the seeds of Rye, which show that germination will take place readily three weeks before the seed has acquired its perfect maturity, and that the plants so produced, though at first weak, are soon equally strong with those from perfectly ripe seed sown at the same time. These observations during the succeeding season were applied with equal success to other plants. The remaining process, therefore, is a mere elimination of moisture, in order to fit the seeds for preservation, so that their germination may be deferred till a season more suitable for the young plant, or to give a greater chance for the preservation of the species. *M. J. B.*

ANIGOZANTHOS RUFA.

THIS, although an old neglected plant and now seldom met with, is nevertheless much more showy and useful than many that are more highly prized. It is of easy culture, blooms most abundantly with proper treatment, and its fine large scapes of hairy odd-looking flowers last many weeks. It is a native of New Holland, and requires merely greenhouse treatment; but, like everything else, it is possible to render it useless by mismanagement, and this seems to be its ordinary fate, for a good specimen of it is hardly ever met with. It is moreover an excellent plant for amateurs, for it is not easily injured by any neglect in watering, and it is not subject to the attacks of insects.

The present season is too far advanced to allow of doing much with it, even if it was procured at once, but persons intending to commence its culture should provide a nice strong healthy plant, as soon as convenient, so as to have a fair chance of a good start next season. Supposing the plants to be obtained between now and March, about the beginning of the month, if the ball is well covered with healthy roots, shift into pots one or two sizes larger, using a compost of about two parts good rich turfy peat and one part light turfy sandy loam, carefully broken up and well intermixed with a liberal proportion of sharp silver sand. After potting place the plant near the glass in a pit where the temperature may range from 40° to 45° at night and 50° to 55° during the day, with a free circulation of air; or if this should not be at command, place it in the warmest corner of the greenhouse, where it will soon start into free growth if kept rather close. Moisten the foliage overhead morning and evening in bright weather with the syringe, but if proper care is observed to have the ball and fresh soil in a properly moist state when the plant is repotted, which should always be the case, but little water will be required at the root for a fortnight or three weeks after potting. The plant is, however, a rapid grower, and will require a liberal supply of water as soon as it gets into free growth; and this must be attended to, otherwise it will progress but slowly. If all goes on well a second shift will probably be necessary early in May, and as the plant will now be in vigorous growth, it should not be checked for want of pot room. The shift on this occasion may be into a pot two sizes larger, using the same soil as last time, with the addition of some lumpy bits of charcoal to keep it open and porous; also observe the same caution in watering as recommended above. A cold pit or frame forms the best situation for this plant during the summer months, and it should be removed here as early in May as convenient, taking care to regulate the admission of air, &c., according to the state of the weather, so as to prevent any danger of checking the growth through removal. On the forenoons of very bright warm days a thin shade will be useful, but this should be of light material and used sparingly. Also sprinkle over-head morning and evening in fine weather, maintaining as moist an atmosphere as can be done with due regard to a free admission of air. Towards August the plant will be benefited by exposure to the night dews, and the lights may be removed every fine evening, but should be put on again in the morning. When damp cloudy weather occurs in autumn remove the plant to a light airy part of the greenhouse, where it should be wintered, keeping it near the glass, and giving a very moderate supply of water at the root, while the plant is in a comparatively dormant state.

Where good sized specimens are wished before flowering, it will probably be necessary to grow them a second season, and in this case the treatment already recommended should be practised, and of course the flower scapes should be removed as soon as they make their appearance. When the plant is considered large enough for flowering, and with anything like good management a large specimen will be obtained in the course of two seasons, it should be allowed to remain in the greenhouse until it is fully in bloom, removing it farther from the glass as the flower scapes lengthen, to prevent their being injured by growing against the glass, &c. The plant would flower quite as freely if placed in a gentle heat to forward it, as when kept in the greenhouse; but I have found that in a moist warm temperature the flower scapes attain a rather unsightly length, and to have these of only a moderate height, and strong, the plant should be kept in an airy part of the greenhouse, and near the glass. When in flower it may be removed to any cool airy place wherever its flowers will be most acceptable, and if properly supplied with water and preserved from damp they will last for some two months at least. As soon as the flowers decay trim the plant, and replace it in the closest part of the greenhouse to make its growth, repotting it if necessary to afford space to the roots. Propagation is easily effected by division, and well established specimens are soon obtained by placing the young plants in a rather close moist growing temperature. *Alpha.*

COTTAGE GARDENS IN SCOTLAND.

THE following is a description of a cottager's garden at Katesmill, near Slateford, Edinburgh, which received the first-prize for cottagers' gardens at a meeting, the other day, of the Currie Horticultural Society. It is one of four of similar size, and alongside of one another, which received the four first prizes for well-kept gardens on that occasion; and for neatness, fertility, and a happy union of usefulness with beauty, they certainly did great credit both to their owners and to the Society, whose influence in this way has been most beneficial over the few parishes in that neighbourhood to which it confines itself.

Mr. Gray, of Slateford, who has furnished the description, says:—

"In sending you an account of one of our men's gardens, I have chosen that of Alex. Kinnaird, who got the first prize (a hive of bees, value 30s.) for the best kept garden. His ground measures 88 feet 4 in. in length, by 15 feet 8 in. in breadth. The divisions, as stated below, are all beds lying across the width of the garden.

"1st Division.—This is a flower bed, 2 feet 8 inches wide, and planted with Tom Thumb Geraniums, 26 in number. In the centre is an oval flower basket filled with two large Geraniums, two Petunias, light and dark, Nemophila insignis, Saponaria calabrica, sweet Alyssum, and other small creeping plants. At the top of the bed is a light wooden rail painted white; this is covered with Verbenas and Petunias, all neatly trained, the whole surrounded with Box edging, and a gravel walk 1 foot 10 inches in breadth.

"2d Division.—This contains such plants as Dielytra, Chelone, Achillea, different kinds of Delphiniums, double scarlet Lychnis, double French Rockets, double white Campanulas, Pentstemons, double Sweetwilliams, of sorts; Fuchsias, and Phloxes; all good kinds. Also two rustic flower vases, filled with scarlet Geraniums, and other creeping plants. A gravel walk two feet wide, with Box edging, finishes this division.

"3d Division.—This is filled with flowers consisting of nine fancy Geraniums, six Pinks, six Carnations, six Antirrhinums, one Cuphea, one Nierembergia gracilis, four Salvias, and seven Ten-week Stocks, together with various other small plants; the whole surrounded with Box edging.

"4th Division.—A gravel walk divides this from the former compartment. This one consists of a bed of spring-sown Onions 2 feet wide, two rows of Potato Onions, two rows of Shallots, one row of Scotch Leeks, two rows of Turnips (Golden Stone), two rows of early Potatoes (Dalmahoy), four rows of Dons, and eight rows of transplanted Leeks. This division is 26 feet long, and finishes with a border of Roses, consisting of William Jesse, Duke of Cambridge, and several other good sorts, surrounded with a Box edging.

"5th Division.—A gravel walk 1 foot 8 inches in width, and a flower border 2 feet in width, commence this compartment. The border contains Ten-week Stocks, China Asters, French and African Marigolds, and a rustic vase filled with plants like the former ones. At the end of the walk is a rustic seat, 4½ feet long, covered over with two large scarlet Geraniums, Sweet Peas, Tropæolum canariense, &c. Then there are, one row of triple curled Parsley, eight rows of Potatoes (Prince Regents), one row of Beans (Longpods), two rows of Peas (Bishop's Dwarf), one row of Cauliflowers, two rows of Cabbages (early), one row ditto (late), two rows of Savoys, one row of German Greens, one row of Lettuces, and one row Sweet Peas 6 feet high, trained on a paling, which completes the whole."

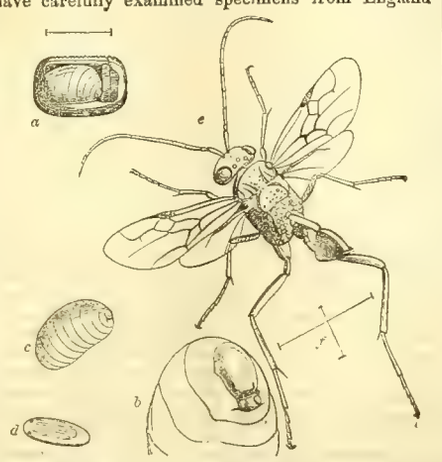
ENTOMOLOGY.

The Cock-Roach Parasite.

The destruction of animal life for the supply of food by other species of animals is one of those *untoward* "harmonies of nature" which we are in the habit of looking upon with regret, but which is required for maintaining the "balance of power" in the natural world. In general, the predaceous species is remarkable for the activity of its movements, the strength of the muscles of its locomotive organs, and a certain lightness of construction, which enables it to perform its determined, though to us apparently unpleasant, duty in the most effectual manner. There is another class of animals, however, which, although preying upon others, possess none of the above characteristics—being, in fact, not only very slow in their movements, but absolutely destitute of distinct organs of locomotion. These are creatures which, therefore, must necessarily perform their destructive functions in a totally different manner from the former. Placed in the midst of a supply of their prey, they need no legs or wings to hunt it down, but insidiously move on, either destroying their single victim by slow and sure degrees, or else finding fresh victims within their reach. Such is the case with the great mass of insect parasites belonging to the families Ichneumonidæ, Chrysididæ, and some other closely allied families. It is in the larva state that these insects take their chief supply of nutriment, and during this state they are naked footless grubs, which (not being fed from time to time by their parents, as in the case of the social bees and wasps) are obliged to be placed by their parents in situations where they can obtain a sufficient supply of food; hence the females of most of the species have the instinct to introduce their eggs within the living bodies of caterpillars, upon the fatty matter of whose bodies the young when hatched continue to feed until they are full grown, when they either burst forth and become pupæ on the outside of the dead bodies of their victims, or are transformed within the chrysalis, which, instead of bringing forth its proper species, gives birth to one or more of the perfect parasites. Other species deposit their eggs within the eggs of other insects; these are, of course, insects of very minute size, unless the eggs to be attacked are deposited in a mass, when parasites of a larger size are ready to attack them; thus from the ball of eggs of some species of spiders we have reared moderate sized Ichneumons. We also possess parasites from the mass of eggs of the Mantidæ, and we are now enabled to illustrate the history of the parasite of the egg case of the Blattidæ or cockroaches.

The first notice of the natural history of this curious parasite, which belongs to the genus Evania, was given by Messrs. Kirby and Spence, in the "Introduction to Entomology," vol. iii., p. 580, where it is stated that "the history of Evania, the parasite of the Blattæ, has been traced by Dr. Reid, who did not, however, live to give his discoveries to the world; it is, however, hoped they will not be lost, being in most able hands." And in the fourth volume of the same work, p. 216, it is added that the late Dr. Arnold, whose tact for observation with regard to the manners and economy of insects has rendered his loss irreparable, discovered that the remarkable parasitic genus Evania *Fab.*, was appropriated to the all-devouring Blattæ, *whether it attacked it in its egg or larva state the author had not been informed.* This little benefactor is here extremely rare, at least in the country; perhaps in towns where the cockroach abounds, it may be more common." No further information on the subject was published, either by Dr. Reid or Dr. Arnold, and the uncertainty as to the mode of its attack upon the Blattæ is noticed both in the works of Curtis and Stephens. The former of these authors, however, suggests that, as Evania minuta is found upon Parley Heath, Dorsetshire, where Blatta lapponica abounds, and as these insects are found in company together, the former may be the parasite of the latter (Brit. Ent., pl. 257); and hence Mr. Stephens (Illust. Brit. Ent., vii., 118, 119) considering that Evania appendigaster is attached to the true Blatta (B. orientalis the common cockroach) which is not a truly aboriginal insect, rejects its supposed parasites Evania appendigaster and fuscipes (flavicornis Curt.) from the British list; considering, on the other hand, Evania minuta and fulvipes, which form a separate sub-genus (*Brachygaster* Leach, *Hyptia* Illiger,) as parasites on the indigenous species of the Blattideous sub-genus Ectobius, of which B. lapponica is the type. I am fortunately enabled to confirm and extend the above remarks from information received from several independent observers. From Mr. R. H. Lewis, an excellent entomologist, I received an Evania apparently identical with Evania appendigaster, with the remark—"A citizen of the world, taken at sea, parasitic on a large Blatta which infests ships." The insect was taken on board the ship in which Mr. Lewis sailed to Van Dieman's Land, and which was much infested with Blatta orientalis. I am further indebted to Mr. W. S. M'Leay for the information that it is within the egg case of the Blatta that the Evania is parasitic. And now I am enabled, from a communication received from one of our correspondents ("J. S.") to give a more complete illustration of the habits of these curious little insects than has hitherto been given. In the accompanying woodcut, figure *e* represents a magnified and *f* the natural size of a living female specimen of an Evania, which I believe to be identical with the true E. appendigaster of Linnæus,* which I received from "J. S.," together with several egg-cases of a species of Blatta, the natural length of which is indicated by the line above figure *a*. Some of these cases contained the ordinary number of eggs of a Blatta almost fully developed, the inclosed young being still white, with small black eyes, and the limbs lying upon the breast (fig. *b*), whilst others (fig. *a*) were nearly filled by a white fleshy mass (fig. *c*) almost destitute of articulations; but, upon examining which more attentively, I perceived a distinct head, with a pair of horny jaws, beneath which were the membranous lower jaws and lip (fig. *d*). This I immediately recognised as the larva of the Evania, which had devoured the contents of the egg-case, and which would doubtless have very soon been transformed into a pupa, had it not suffered injury from the case being smashed in its transit by the post. In an other egg-case I found the pupa of the Evania; and in another the perfect insect fully disclosed and ready to make its escape, so that all the transformations take place within the hard-shelled egg-case, out of which the Evania, when hatched, easily makes its escape with the assistance of its powerful horny jaws. Direct observation is wanting as to the mode in which the parent Evania deposits her eggs in the egg-case of the Blatta, but I have no doubt that this is effected shortly after the egg-case is deposited by the female Blatta, and whilst it is still soft; the peculiar form of the abdomen of the Evania and its remarkable dorsal position are doubtless of service in effecting this object.

The perfect Evania is black, with transparent wings; the front of the thorax is very slightly punctured, and the peduncle, or first segment of the abdomen, is smooth. I have carefully examined specimens from England



Germany, the Island of Mauritius, Mozambique, and Brazil, amongst which I cannot perceive any character to warrant their specific separation.

The Evania above described, with the egg cases, were found by "J. S." amongst Orchids recently arrived from Calcutta. I believe, however, that the plants became infected with the Blattæ on board ship, those insects sometimes swarming to an extraordinary extent in vessels from tropical climates. I am, of course, unable to state what species of Blatta is the parent of the egg case in question; it is, however, nearly as large as that of the common cockroach, but somewhat shorter in proportion to its width. *J. O. W[illegible]*

* See my Memoir on these insects, for the determination of the confused synonymy of this insect and its allies. Trans. Entomol. Soc., vol. iii.

Home Correspondence.

Nimrod Strawberry.—I am sorry to be able to confirm your report, in Notices to Correspondents, Aug. 5th, relative to this Strawberry. I received some strong plants in 6-inch pots from Messrs. Lucombe, Pince, and Co., this spring in full bloom. Six of the strongest plants were selected, and having the bloom thinned out to six fruit on each plant they were placed in a cool house, with full air—in fact in a new house, the glazing of which is not yet completed, and received very careful management. The fruit swelled off and coloured beautifully, and the plants were kept comparatively dry, to heighten the flavour; but it was worthless, sour as a Crab, and very insipid. It is a finely coloured and very handsome fruit, certainly resembling Myatt's Eleanor both in plant and berry; but as I have not fruited the Nimrod in the open ground, I cannot confirm Mr. Doubleday's identification at present. *W. P. Ayres, Tirydail.*

Striking Cuttings.—It may not be generally known that if a kernel of Barley, or any other quick-growing seed, is inserted in the bottom, near a joint of a cutting, or placed under it, it will (by diffusing its vital power) preserve it until it sends forth roots, and it will also induce it to do so by its vivifying principle. γενναω. [!!!]

Clerodendron fœtidum.—At our establishment, for many years past, we have been accustomed to plant out various plants that are usually accounted tender. It is needless to report that, in most cases, death has resulted; but in that of this Clerodendron, about which one of your correspondents enquires, I can assure him that a plant has stood out at the Exotic Nursery for six years, dying down, and becoming herbaceous in its habit. This year the original root stock was killed, but at about a foot from it, in the month of May, a sucker was protruded, and it has now attained a height of between 3 and 4 feet. *William Masters and Son, Exotic Nursery, Canterbury.*

Naming Plants.—I have been for many years a cultivator of plants, and considered myself the owner of a good collection, but Mr. Barnes's account of the varieties growing at Bicton quite startled me; I felt myself a mere tyro, and that I ought to go to school again. On finishing the article, however, I was much comforted by your remark that the varieties were so in name only, and the feeling was strengthened after consulting the best London catalogues, in which no mention is made of many plants named by Mr. Barnes. What a pity it is that practical men should swell out long lists of plants with names only! *An Old Sub, Halifax.*

Fluke Potato.—Thanks for your advice; but it had been anticipated. The Fluke is the only Potato in this neighbourhood that can now be seen with a green leaf upon it, but it is not free from disease, the foliage and stalk are much affected, though at present the tubers have escaped the general wreck. This variety was planted very late, and hence here has not had fair play; but if under such circumstances it resists disease, I can easily see that, when properly managed, it will be found a valuable acquisition. It is also a very handsome variety and a good cropper. Every tuber of it ought to be saved for seed. *W. P. Ayres, Tirydail.*

Damp in Limestone Walls.—If limestone does not admit damp, which is what I suppose "D. V." means, how is it that two or three washes of lime and size will not get rid of damp? I am quite aware that part of the damp is precipitated moisture existing inside, but this is precipitated because the walls are cold from moisture. This my lining of hollow bricks will intercept, and I have no doubt that they will render the walls quite dry. I will soon give you a true account of the effects; much of the damp is likewise owing to the use of ashes (for sand), which contain a good deal of potash in them, and roadsand, which contains much decaying vegetable matter. *Somerset.*

Potato Disease.—Four days and nights constant rain, followed by a warm humid atmosphere, and consecutive heavy showers, have caused no little alarm here. Wheat has been blackened (at least the chaff) as with a soot bag, and in late planted Potatoes, of luxuriant growth, spotted leaves, as if sprinkled with vitriol, and emitting an offensive smell, are making their appearance. Where, however, they are approaching maturity, the crop may be preserved by cutting off the haulm. This should be done as soon as the disease appears in the leaf or bine, or rather before. Pulling up the haulm is not so well, as it shuts in disease, and subjects them to decay. Besides, by this plan, many must be spoiled by the fork when taking them up, as nothing is then left for guidance where the roots are. After amputation, it is advisable (in our opinion) to leave them in the ground, for there they keep best for a time, and many are otherwise torn and wasted by being forced on the market, or by heating in attempting to store them before their skins are set. All the earliest kinds, that were planted early are safe, at least in the neighbourhood of Essex and Suffolk. The late rains have, however, had the effect of removing the sad pest of flies, lice, and other insects, so prevalent of late, on most crops of vegetables, by drowning them all, and kind nature is by a bold effort now striving to overcome the injury sustained by them. *Hardy and Son, Maldon, Aug.* 12.

Richmond Villa Black Hamburgh Grape.—Has any one ever seen this Grape fit to eat, or at any rate fit to be compared with the old Black Hamburgh in quality? I judged it several times at metropolitan exhibitions, but invariably found it a very poor thing; and all the gardeners I have mentioned it to condemn it. Has it any good property by which it can be recommended? If so, I should like to plant it. Has the seedling White Hamburgh exhibited at Regent Street last autumn been found as good as was anticipated? *W. P. Ayres, Tirydail.*

Foreign Correspondence.

Leaves from my Chinese Note-Book.—No. VI.

The Rice-paper Plant.—On the morning of the 20th of April last, the steamer in which I was a passenger dropped her anchor a little way up one of the rivers on the north-east part of Formosa. As this was my first visit to this fine island, and as I knew we had only a short time to stay, I lost no time in going on shore. Before leaving the vessel I had been examining with a spy-glass some large white flowers which grew on the banks and on the hill-sides, and I now went in that direction, in order to ascertain what they were. When I reached the spot where they were growing, they proved to be very fine specimens of Lilium japonicum—the largest and most vigorous I had ever seen. As I was admiring these beautiful Lilies, which were growing as wild as the Primroses in our woods in England, another plant of far more interest caught my eye. This was nothing less than the Rice-paper Plant—the species which produces the far-famed Rice-paper of China, named by Sir W. Hooker Aralia papyrifera. It was growing apparently wild; but the site may have been an old plantation, which was now overgrown with weeds and brushwood. The largest specimens which came under my notice were about 5 or 6 feet in height, and from 6 to 8 inches in circumference at the base, but nearly of an equal thickness all up the stem. The stems, usually bare all the way up, were crowned at the top with a number of noble-looking palmate leaves, on long footstalks, which gave to the plant a very ornamental appearance. The under side of each leaf, its footstalk, and the top part of the stem, which was clasped by these stalks, was densely covered with down of a rich brown colour, which readily came off upon

any substance with which it came in contact. I did not meet with any plant in flower during my rambles, but it is probable the plant flowers at a later period of the year. Numerous small plants were coming through the ground in various directions, which a Chinese soldier carefully dug up for me, and which are now safely deposited in Mr. Beale's garden at Shanghae. These, with a few samples of the largest stems I could find, will be sent to England in the course of a few months; the latter will prove an interesting addition to our museums of vegetable productions. The proportion of pith in these stems is very great, particularly near the top of vigorous growing ones, and it is from this pure white substance that the beautiful article erroneously called "Rice-paper" is prepared.

The Chinese call this plant the *Tung-tsaou*. What it was, or to what part of the vegetable kingdom it belonged, was long a mystery to botanists, who were oftentimes sadly misled by imaginary Chinese drawings, as some of those which have been published will clearly show, now that our knowledge has increased. Indeed the only drawing I have seen in Europe, which has any claim to be considered authentic, is that brought from China by Mr. Reeves many years ago, and which I have seen in the library of the Horticultural Society of London.

The *Tung-tsaou* is largely cultivated in many parts of the island of Formosa, and with rice and camphor forms one of the chief articles of export. Mr. Bowring, who read a paper upon the Rice-paper Plant, before the China Branch of the Royal Asiatic Society, informs us that the Canton and Fokien provinces are the chief consumers, and that the town of Foo-chow alone is supposed to take annually not less than 30,000 dollars worth of this curious and beautiful production. The cheapness of this paper in the Chinese market, as Mr. Bowring justly remarks, is evidence of the abundance of the plant in its place of growth, and more especially of the cheapness of labour. "That 100 sheets of this material (each about 3 inches square), certainly one of the most beautiful and delicate substances with which we are acquainted, should be procurable for the small sum of 1½*d.* or 1½*d.*, is truly astonishing; and when once the attention of foreigners is directed to it, it will doubtless be in considerable request among workers in artificial flowers in Europe and America, being admirably adapted to their wants."* The larger sheets, such as those used by the Canton flower-painters, are sold for about 1½*d.* each.

If the Tung-tsaou proves hardy in England, its fine foliage will render it a favourite amongst ornamental plants in our gardens. Judging, however, from its appearance when growing on its native island, and from the temperature of Formosa, I fear we cannot expect it to be more than a greenhouse plant with us. Plants of it are already in the Royal Garden at Kew, and the point will soon be set at rest by actual experience. *R. F.*

Societies.

Entomological, *August* 7.—H. T. Stainton, Esq., in the chair. Mr. Boyd exhibited specimens of the rare Limacodes asellus, taken in the New Forest in July; Mr. Ingpen a large collection of Australian Diptera and Hymenoptera, also a foreign wasp's nest, the outer envelope of which was proved, by a microscopical examination of the texture, to be entirely composed of fungoid matter. He also exhibited a portion of the interior of one of the Cedar of Lebanon trees from Chelsea Physic Garden, which was coated by a layer of fungus, similar to the material of which the wasp's nest was composed. Mr. W. Wing stated, in reference to the same subject, that he had observed a wasp busily engaged stripping off the pile from the mullein. Mr. S. Stevens exhibited a drawing of a remarkable variety of the larva of the death's-head moth; also a specimen of the newly discovered Trachodes hispidus (a weevil), taken by Mr. Plant, near Leicester. Mr. Boddy exhibited a living specimen of the fine Ludius ferrugineus and its larva, from decayed Oaks in Windsor Forest. Mr. Moore sent a further supply of Zygæna minos for distribution, and Mr. Hogan specimens of a Sphæria growing upon a lepidopterous caterpillar; the Sphæria was very thin, and 1½ inch long. Mr. Douglas exhibited specimens of Grapholetha Nisana, reared from the catkins of the Poplar and Sallow. Mr. Westwood exhibited specimens and drawings of a very remarkable minute coleopterous insect recently discovered by Mr. Bates in ants' nests in Brazil, for which he proposed the name of Gnostus formicicola. He also exhibited, from the Economic Museum of Botany at Kew, specimens of a species of Trochilium reared from galls upon the North American Quercus palustris. He also gave an account of his observation of the transformations of Evania appendigaster, a parasite on the egg-capsules of Blattidæ. Mr. Curtis read notices of the capture of two new British species of Hemerobiidæ, also correction of the nomenclature of the species figured by himself in his "British Entomology," notes on nomenclature in general, notices of new captures of rare insects, and on the species of Tortricidæ infesting Pines, and their parasites.

Phytological Club, *March* 8.—The President in the Chair. A communication on Cotyledon umbilicus, from Mr. Gissing, of Worcester, was read. The author said, "I believe that a work on the popular uses of British plants, among the lower classes of the English people, would prove both useful and instructive. Among other things, it would, I think, exhibit the fact that in many of the new remedies introduced into medicine, the practice of the village doctress has furnished the first hint to the supposed discoverer of new virtues in various plants. The one plant, or 'herb,' as all wild plants are called by the common people, that I have now more particularly in view, is Cotyledon umbilicus. This plant, it is well known, is very common in Devonshire, Somersetshire, and the south-west of England, as well as on the rocks in Wales and the counties bordering thereon. In the former counties it grows chiefly on banks, and attains a much greater height than in its more rocky habitats. From Somersetshire I have seen specimens, the flower-stalks of which were 2 feet or more high, but plants growing in more mountainous situations I have seldom seen exceed 8 or 10 inches. Perhaps I may say a few words here upon the shape of the leaf of the Cotyledon umbilicus. In Monmouthshire, Gloucestershire, and Worcestershire, I have gathered plants with some of the root leaves kidney-shaped, and others spathulate, and not peltate, as is usual. I am unable to state whether these leaves would afterwards have assumed the peltate form; but, from the fact of several of the other leaves on these plants having their stalks at various distances from their edges, I thought there was a probability of their having been originally reniform, or spathulate. I know it is by no means a general rule for the leaf-stalks to be central, but the two circumstances united in one plant, caused the supposition that the peltate leaf might be a development of an earlier form. I name this fact because I have never before seen it noticed; if it be general, it is worthy of remark. The leaves of the flower-stalk, I know, are generally nearly reniform, but the leaves I have spoken of were growing long before the flower-stalk made its appearance. One of the common names of 'Cotyledon umbilicus,' is Kidney-wort. Now we know, pretty certainly, that the other vulgar names, Penny-wort, and Navel-wort, are given from the shape of the leaves. Did the person who added to these names kidney-wort do so for the same reason, or from any supposed curative power? Most likely the latter; but still, bearing in mind the leaves I have spoken of, there is a possibility in favour of the former. Respecting the medicinal use of the Cotyledon umbilicus, it is well known to most chemists and druggists that Mr. Salter, of Poole, introduced it a few years since as a cure for epilepsy, since which time it has been used, although I believe to only a limited extent, amongst medical men. In Monmouthshire and Herefordshire I found, on inquiry, that the leaves were taken for urinal obstructions and 'fits;' in Lancashire, amongst other complaints, they are likewise taken for 'fits.' In Herefordshire I find they are used for corns and worts; in Worcestershire they are used for the same purpose; hence they are called 'corn-leaves.' They are likewise used here to make a cooling ointment, and their juice is expressed and mixed with cream, as a cooling lotion for sore faces or chaps in children, in the same manner as the juice of the Houseleek (Sempervivum tectorum). Whether Mr. Salter knew of its use amongst the common people for 'fits,' and examined for what kind of 'fits' it was used, and found it to be epilepsy, of course I am unable to say, but I make no doubt it was used for what the people call 'fits,' very many years before Mr. Salter introduced it into the regular practice of medicine. For it is most unlikely that the people should have recently adopted it, as they generally are violently opposed to all innovations upon their time-hallowed customs. Witness the feeling still prevalent in many parts against vaccination. The word of a village doctress is much more powerful amongst the ignorant peasantry than that of the qualified practitioner. She is a remnant of a bygone age, and I doubt not, as surgeons penetrate more into remote districts, the rising generation will totally discard the only medical adviser of their forefathers. The doctress commenced her practice when it was almost the only mode of treatment; and when, if surgeons differed from her, it was only to prescribe more absurd and disgusting remedies; she kept it when medical men came to be comparatively frequent; and her 'occupation' will only be fully 'gone,' when the class that now constitutes her patients has become intelligent enough to prefer science to quackery. Ray says, that the roots and leaves of Cotyledon umbilicus (or Umbilicus veneris, as it was then named) were used for erysipelas, &c., and refers to Dioscorides and Galen. Dr. Hill, in his 'Family Herbal,' gives it as a general cooling medicine, internally and externally. In the last edition of Gray's 'Supplement to the Pharmacopœias,' it is said to be used in the same manner; and in Meyrick's 'Family Herbal' it is given as cooling and diuretic, and good for burns; but in none of these are 'fits' named. Whether the authors disbelieved the utility of the plant in these diseases, or whether they were ignorant of its use in such cases, I cannot tell. It is likewise very difficult to determine what ignorant people mean by the term 'fits;' apoplexy, paralysis, hysteria, and epilepsy, are all 'fits' with them, they have no discriminating eye for the different symptoms that denote the different kind of 'fits.' The only notice I have seen of Cotyledon umbilicus being used in any of the diseases just named, is in the 'Pharmaceutical Journal' for 1849, where Mr. Ince observes, that it has long been a popular remedy in 'hysteria.' Anything that alleviates the sufferings of humanity should be hailed with satisfaction, and whether Mr. Salter has taken a leaf from the prescription book of the village doctress, or not, is of but little consequence, so long as it is useful, but in that case it is not a new medicine. A friend suggested to me some time since, that probably there was a difference in the extract made from the 'Cotyledon umbilicus' of the southern and western parts of England, and of that made from the plant gathered in more rocky situations, as Wales, &c. I wish I could speak more positively upon this point, but I have had no opportunity of testing it. I can only say that a London manufacturing chemist saw some made from plants gathered in Worcestershire, and declared it the best he had ever seen. I believe the London market is supplied with Cotyledon umbilicus (or the extract) mostly from Devonshire, Somersetshire, &c.; therefore, whether the difference in the extract was caused by the different habitats of the plant, or by greater care in the preparation, remains a question that can only be solved by absolute practice. From what I am able to judge, the amount of extract yielded by the green leaves gathered about February, varies from 4 lbs. to 6 lbs. in the hundred-weight. This extract is also about the consistence of soft butter. I pretend to no originality in these remarks, but have brought them forward, thinking they may induce others, who, perhaps, possess greater advantages than myself, to examine the subject of the local uses and names of British plants. There is scarcely a chemist and druggist who is not, at some time, made aware of his deficiency on these points, through the application of some person for an article which he, in all probability, possesses, but which he fails to recognise under the name given it by the common people, more particularly if he be a comparative stranger in the locality. In examining the subject, they might eliminate all that is worthless, and adopt whatever they found worthy of support. In doing this, they will be just as much assisting truth and progress as if they were engaged in some higher and more ostentatious branch of the sciences."—The President said that in his opinion, whether Mr. Salter was the original discoverer of the virtues of Cotyledon umbilicus in epilepsy, or only the introducer of it into the regular practice of medicine, he was equally entitled to the thanks of the community at large for any benefits that might arise from its use, although, as far as his own experience went, he thought that the value of this remedy in epilepsy had been much overrated. The President also stated that he was very glad to find, from the interesting paper just read, that the local uses of our indigenous plants had begun to excite the attention of the members of the Phytological Club; as this was one of the prominent objects contemplated at its establishment, and one also which he had on several occasions impressed the importance of upon the members, he hoped, therefore, that this paper would soon be followed by others on similar subjects. Mr. Bentley also called attention to that part of the paper referring to the probability of the extract of Cotyledon umbilicus, prepared from plants from different habitats, possessing somewhat different characters. He thought that this was very likely to be the case, as he believed that climate, soil, &c., had far more influence in modifying the properties of plants than was generally supposed, and from the importance of the bearings of this subject upon pharmaceutists, who had continually to make use of plants and their products in the preparation of various medicinal compounds, he urged the necessity of a thorough investigation of the matter upon the members of the club. Mr. Blyth observed, that the extract of the Cotyledon umbilicus had been largely tried at St. Mary's Hospital, more especially by Dr. Sieveking, and the effects had been so satisfactory, in some cases of epilepsy, in causing a remission of the attack, as to justify its further use. Dr. Sieveking had observed, that its exhibition was followed by long intervals of freedom from fits—intervals that had been regarded by the patients themselves as cures—but which, without exciting extravagant hopes of cure in every case of epilepsy, might lead to the further investigation of what, if properly applied, might prove to be a serviceable preparation—he had distinctly traced its action upon the kidneys—it was manifestly a diuretic. Mr. Blyth, from personal communication with Dr. Sieveking, knew this to be his impression, and he (Mr. Blyth) thought pharmaceutists could not be too careful in the preparation of the extract. He did not know from what part of the country the plant was obtained from which the extract supplied to the hospital was made—but the extract itself was most unexceptionable. It was the province of the pharmaceutist to prepare a good extract—it was the province of the physician to judge of its effects. *Pharmaceutical Journal.*

Notices of Books.

Burgess's Amateur Gardeners' Year Book (Black, 12mo) is in a great measure a reprint of some useful practical articles which appeared in our columns in 1846—9. At the time they were much valued by our readers, and we are glad to see them now forming a book which we can recommend to gardeners as well as amateurs, as a collection of plain, unpretending, practical, well written instructions, by which all may profit. Dr. Burgess's account of himself and his horticultural employment is new, and serves as a good introduction to a very good volume:—

"I have watched with great interest, for some years, the movements of a horticultural society in a flourishing country town, and have often been surprised at the difficulties with which it has had to contend, from the prevalence of the habit of estimating everything by its

pecuniary return. A scheme for a gas-house, a railroad, or a town-hall is eagerly embraced, because each will yield, perhaps, an interest for the money invested; but a horticultural society is placed in a different category. It is true its shows are attractive; that fellow-townsmen find their harmony promoted by its meetings; that a taste for the innocent and the beautiful is fostered by its influence; that the labouring classes are taken from low and injurious pleasures by its exertions—all this is conceded; but there is no money return, except to the successful candidates for prizes, and therefore it cannot be warmly espoused. A few kindred spirits, by dint of influence and careful canvassing, get up a subscription-list sufficient to keep the society in existence; but a conviction is always forced upon its promoters, that a love of gardening has yet to be formed, and that nature's beauties, although praised, are thought worthy very little time, attention, or money.

"Now, the situation of this horticultural society will illustrate my meaning, when I say that the amateur gardener feels a momentary blush when called upon to defend his pursuits. The possessor of acres of pleasure-ground would never have this feeling, for no one would laugh at him for his expensive tastes, associated as they are with high life and with wealth. But the owner of a garden a few yards square, to which he devotes his mornings and evenings, often becomes sport to the thoughtless for his attachment to his humble Flora. In his heart he knows that he is right, for he feels ennobled by his blameless occupation; but he is often at a loss to defend himself against the bluster of ignorance, and the heartlessness of mere money-makers. When a friend says, 'Your Cabbages must cost you a shilling a-piece, if your labour is taken into account; and your Roses, judged by the same rule, are each worth half-a-crown,' and evidently thinks he has employed an irrefragable argument, the modest cultivator scarcely knows how to retaliate. The fact is, it is difficult to balance taste against the want of it, or mental pleasures against such as are more sordid; and if I can assist the amateur in defending himself, and confuting his antagonist, I shall probably be of service to him. It is well for the judgment to go hand in hand with the heart, and to be able to show a good reason for the love of gardening and flowers.

"Perhaps my advice and reasoning may be better received if, in a slight autobiographical sketch, I can establish a claim to experience and knowledge of the subject of which I write. I am then like, I presume, many of my readers, an amateur gardener. My practice in this art dates back as far as a quarter of a century, when in the suburbs of London I had a little plot in the garden of my father, made little hotbeds of his stable manure, and gloried in the production of a pungent Radish or an abortive Cucumber. Ignorant country people may sneer at at the mistakes of cockneys as to rural pursuits; but who can disparage with justice their love of gardening and flowers? The Mignonette in a broken pan, or a Hyacinth in a blacking-bottle, which may be seen in London's darkest streets, and the Ward's cases in the drawing-rooms of its wealthiest citizens, furnish sufficient proof of the floral taste of the largest city in the world; and I can testify that, in my boyish days, a love of gardening filled the hearts of multitudes of urchins within the sound of Bow-bells. Since that time my occupations have been those of the wits, not of the hands. At one period, an engrossing affection for literary pursuits threatened my health, and rendered a return to the recreations of childhood necessary, as the means of securing a right mental and bodily state *mens sana in corpore sano*. I took to gardening with a heartiness and love which made its labours pleasant, and its successes delightful. Many persons will tell you they love flowers, who love only to look at them, but would rather see them die than give them a re-potting, or even a careful watering. I did not pursue the craft in this way. I endured the labour that I might enjoy the triumph of success. The preparation of a Ranunculus bed in the winter season; the turning over the soil again and again, that the whole might be mellowed by the frost; the back-aching work of planting in February; the pressing down the soil around every individul plant as it appeared above ground; all this I have done, and been amply rewarded by the exercise itself, but especially when, in the month of June, my bed has developed the matchless charms of these delicate *élèves* of Lightbody and Tyso.

"In these pursuits health has been secured, and peace of mind promoted. A hard ride has been said to be the Englishman's remedy for melancholy, nor is it to be undervalued; but having tried both I give the preference to gardening."

A *Bryologia javanica*, in 4to, by Dozy and Molkenboer, has begun to appear at Leyden, in numbers. Part I. is before us, with 5 plates, containing huge figures of minute species of Fissidens. We are at a loss to understand the use of covering paper with such representations, which add much to the expense and nothing to the utility of books. The five plates in question would have been quite as good if included in one.

With the name of *Tuinbouw-Flora* a horticultural and botanical miscellany has begun to appear at Leyden, under the care of Prof. de Vriese. Five parts in 8vo are before us, but, being written in Dutch, we can give only an incomplete idea of their contents. The first part is chiefly occupied by an account of the Mumè, or Japan Apricot, *Armeniaca Mumè*, and of other Apricots, and with an article on Wellingtonia; it also contains the commencement of a disquisition on window gardening. The succeeding parts are occupied by papers, original and translated, on Vine mildew, on Palms, Cyclanths, &c., cultivated in Europe, Hoyas, and other plants of horticultural interest. In the last number is a long article on Ward's cases, in which the editors propose to construct them taller, shorter, and with upright glass sides. We shall endeavour to give, from time to time, some account of the original articles in the work before us.

New Plants.

75. Arceuthos drupacea, *Antoine and Kotschy in Œsterreiches Botanisches Wochenblatt, Aug.* 3, 1854; *aliàs* Juniperus drupacea. *Lab.*

Under this new name the Juniperus drupacea, mentioned lately at pp. 387 and 455, has been just published at Vienna. The authors furnish a long Latin description of the genus, *more Germanorum*, but they say nothing about the distinction which they imagine to exist between it and a Juniper. They add that the fruit is as large as a Walnut.

We learn from the *Wochenblatt* that the parents of this new genus are about to publish a memoir on the "Coniferous plants of the Cilician Taurus."

76. Thuja gigantea.

The plant, figured in a late number of the "Revue Horticole" under this name, is the same as the *Libocedrus decurrens* of Torrey.

77. Pinus Bourcieri, *Carrière in Revue Horticole*, 1854, *p.* 226, *figs.* 16 *and* 17.

This supposed new Pine from California is the same as the *Pinus contorta* of Douglas, and is a species of no horticultural value. It is very nearly the same as *P. Banksiana*.

78. Oncidium umbrosum, *Rchb. f.; aliàs* Odontoglossum umbrosum. *Id.*

A very ugly straggling small-flowered species, with a green calyx and petals and a dull purple lip. It was found in New Grenada by Moritz, and has reached our gardens through some of the importers. It flowered the other day with Sir Philip Egerton. Mr. Reichenbach originally described it as an Odontoglossum, an error that he has since corrected. It is near the Oncidium Lindleyi of Galeotti, a Mexican plant not yet introduced.

Garden Memoranda.

Mrs. Conway's Nursery, Earl's Court, Brompton.—This is one of the gayest little nurseries in the neighbourhood of London, and one of the best examples with which we are acquainted of how much may be effected in the way of display by means of such materials as scarlet Geraniums, Verbenas, Petunias, bedding Calceolarias, and one or two other plants equally cheap and easily procured. During the whole of the summer and autumn months these furnish an amount of floral beauty which is at once attractive and striking, and which any person having a few square yards of gravel in front of his house may possess; for most of the plants here are kept in pots, and tastefully arranged in clumps on gravel, on which, however, in suitable positions, mounds of earth have been thrown up, so as to break the sameness of appearance which a flat surface would present. These have a grass verge round their base, and are terraced for the convenience of growing plants on them; one of them has been planted as follows:—on the top are scarlet Geraniums, then a band of the blue Ageratum mexicanum, next the yellow Calceolaria viscosissima, and last, or nearest the gravel, Petunias and Frogmore and Tom Thumb Geraniums, the former being preferred. Two other mounds had Hollyhocks (small plants) on their tops, and on their sides common China Roses intermixed with Calceolaria viscosissima and scarlet Geraniums. The Roses flower beautifully in early summer, and again in October, keeping on then till the frost kills the blossoms. Of the beds on the gravel, one consisted of light coloured Petunias; another of purple Petunias (Beauty Supreme); a third, of Œnothera prostrata, with an Araucaria imbricata in the centre; a third scarlet Geraniums; a fourth, Lobelia Erinus, with a Deodar in the centre; a fifth, different kinds of Heliotropes; a sixth, Ageratum mexicanum; a seventh, a Yucca, with Forget-me-Not round it; while others were made up of variegated Geraniums, such as Golden Chain, Mountain of Light, Flower of the Day, and the variety called Osborn's Brilliant, a low growing kind, with leaves narrowly edged with white, and a profuse flowerer. There was also a clump of pink Geraniums, the flowers of which were, however, very much spoiled by the late rains. Of Verbenas there were beds of Blue Bonnet, Andre, and Purple King, all good kinds of different shades of purple; Crimson King, a fiery-scarlet with a small light eye, and good habit; Duchess of Kent, white with a purple centre; and General Bedeau, a brilliant rose with crimson centre. Under glass were examples of the old pink Nosegay Geranium, still one of the best for running up trellis work; Kingsbury Pet, a light salmon with a horse-shoe leaf; Ingram's Princess Alice, a pretty pink variety; Sheltoni, white changing to pink, and having a horse-shoe leaf; and a Seedling called Empress, bearing fine trusses of scarlet flowers, and leaves variegated in the way of Golden Chain. Among strong growing scarlets, Tam O'Shanter will be found a worthy associate for Shrubland Superb, or Ibrahim Pacha. Among Heliotropes, one called Premier appears to be an improvement on Voltaireanum nanum, being brighter coloured and rather a stronger grower; and as regards Lobelias, it may also be worth mentioning that L. racemosa is certainly a better kind for out-door purposes than L. Erinus. Camellias and Fuchsias are also grown here, and the former are well set with bloom. Roses in this neighbourhood, as elsewhere, have been much affected by blight. All kinds of Geraniums are struck here in the open air, not only the coarser-growing scarlets, but also variegated and fancy varieties. A small bed is prepared for them, and the cuttings are put in and shaded for a day or two, and then, with the exception of watering them occasionally, left to take their chance, and they generally strike without a single failure.

FLORICULTURE.

Scarlet and Purple Unique Pelargoniums.—It is generally admitted that it would be difficult to propagate these beautiful varieties in quantities sufficient to meet the demand that might be expected to speedily arise for them, for the purposes of bedding, in the event of their becoming plentiful. With that object in view, therefore, I have several times tried various experiments in the hope of bringing about this much to be wished for result; but my endeavours, with one exception, have only been partially successful. By the following method, however, I have been enabled to strike Unique with facility. Before taking off the cuttings I expose the plants from which they are to be detached, for three days or thereabouts, to the full action of the sun, during which time I give no water; this has the effect of hardening the wood, and prevents the cuttings from fogging off. I insert the latter in a compost consisting of two-thirds finely sifted exhausted mould, one-third sharp sand, round the sides of pots previously filled to the extent of one-half with small potsherds; the cuttings are firmly embedded in the soil in such a manner as that the base of each shall rest on the crocks. By this plan they are not injured by too much moisture while the process of rooting is going on. The store pots are then placed on a level well drained bottom of a cool pit or frame. I abstain from watering the cuttings for the first few days after they are inserted; and the better to enable them to do without it for that period, I keep on the lights, merely tilting them a little at the back, for the purpose of affording a means of escape for the heated air within, and I shade with mats from the mid-day sun. In watering care should be taken to wet the foliage as little as possible, and not to give it until it is really required. Treated in this way, the cuttings will be found to root readily in three weeks, and to become established plants in a month or five weeks more. *R. M.*

Cultivation of the Pansy.—The following remarks on this subject, in addition to those made by your correspondent "D." at p. 503, may perhaps not be unacceptable. I know of no plant so easy to cultivate, and at the same time so difficult to keep from year to year, as the Pansy. It may be raised from seeds and bloomed in a few months, and an endless variety of colour, marking, and texture, may thus be produced. Choice kinds, either selected from the seed beds or procured from the florists, are seldom bloomed more than once, unless by some expert amateur, or in some favourable locality. In winter the Pansy is extremely liable to damp off, although protected in frames; and we all know, to our mortification, the ill effect of a summer's sun on it. It is scarcely possible to point to another tribe of plants so peculiarly the amateur's as this, or one that puzzles him to cultivate more. The following hints may assist him. Seeds sown in autumn in pans, or even in the open border, will come up readily in a few weeks. The seeds should be lightly covered with fine soil, if covered at all, as half the seeds sown rot in the ground, from being covered too deeply. As soon as they have pushed the second set of leaves, they should be planted out in beds, in lines, from 8 to 10 inches asunder. If the seed has been carefully saved from good kinds, an interesting display will be the result; and the raising of new varieties is a labour of peculiar interest. As spring advances, the plants so treated will commence flowering. The next point will be to select those which possess good qualities, with a view to perpetuate them. There are many singular and pleasing varieties that do not come within the arbitrary rules by which florists' flowers are judged, which, nevertheless, are worth retaining for common border decoration; but, if a rigid adherence to these rules is determined upon, then the flowers must be as nearly round as possible, expanding their petals flatly; crumpled petals, with ragged edges, are points that will justify their being cast aside. Round flowers, with flat petals, must always have firmness of texture to recommend them; a flimsy flower in the fancy, although possessing other properties, is universally discarded. The eye should be concentrated, and not starry; the colours soft and clearly defined. These instructions will enable the amateur to select the right kinds from his seedling beds. As soon as he has determined upon those worth retaining, propagation should be commenced, and this is a simple matter. Cuttings taken off at the second and third joints will root readily, placed behind a hedge or wall, on the north side, without any protection whatever. Insert them 2 inches apart, and 1 inch deep, in soil of a light, sandy texture, and they will root in a few weeks. Take care that all damp leaves are removed as soon as they appear. To produce a bed of choice Pansies, select a north aspect, with a cool bottom; soil of medium texture, and moderately enriched, should be preferred for the production of large flowers. Keep the soil frequently stirred round them, and be careful

that the border is free from wireworm. If the plants are put out early next month, they will be established before winter; and I have frequently found that plants so treated get through the winter quite as well as those coddled in frames. As their propagation is easy, depend exclusively upon young plants for the following season's bloom. Seeds should only be saved from beds of selected flowers possessing the best qualities; for, it is only by following this up that improved kinds to any extent can be obtained; and, as seed is readily produced, it is not worth while saving that from doubtful sorts. *S.*

Miscellaneous.

The Peach Tree and Red Spider.—This troublesome little rogue is extremely fond of dry places, and it generally insinuates itself on the underside of the leaf, first in very small patches; and on the approach of a few very hot days, which generally occur about the beginning of August, it spreads over the leaf with inconceivable rapidity, its web being so very fine that it is difficult to see with the naked eye; but its presence is unmistakeable to the practised eye, even at many yards distance, by a sort of dingy reddish brown colour of the leaves. These insects are exceedingly injurious to the health of the plant, because they stop the respiratory organs, and prevent the perspiratory channels from properly performing their functions. Constant washing with pure water, or water impregnated with sulphur, is the only mode that will effectually stop their ravages. Sulphur is very disagreeable to the red spider, but it is very difficult to mix with water without some precaution is first taken to "kill" it (if I may be allowed to use the word). This may be easily done by well working it into a paste, with a little clay, or yellow or soft soap, then stirring into the water 1 lb. of flower of sulphur to 9 or 10 gallons of water. This will be a good dressing for 1400 or 1500 square feet of wall. It should be put on with a syringe, standing sideways of the trees, and directing the stream from the bole of the tree each way, being the only means of getting at the underside of the leaves. Two or three dressings of this sort will generally clear the trees of these troublesome insects, provided they are sprinkled three or four times a week with pure water at the same time, and it should be always done at once; no delay must be permitted, as, besides the insects getting so much a-head, the time is fast approaching when the water and sulphur will be impracticable, as the fruit is fast arriving at maturity, and of course will not be improved in flavour by overwatering. *Cox on the Peach and Nectarine.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The usual quantity for a season's supply of the kinds of soil used in potting should be laid in as soon as convenient, and before the ground gets sodden with the autumn rains, for even turfy soil should not be carted and stacked up when saturated with water. The soil should be neatly put up in narrow ridges, so as to be safe from wet, and exposed as much as possible to the action of the air. And as success in plant growing very much depends upon having suitable soil for potting, no trouble or expense that may be necessary to procure this should be spared where well grown specimens are expected. Loam of a moderately good quality may be obtained in most neighbourhoods, but good peat is not obtained in many localities. This is absolutely necessary, however, for the growth of choice hard wooded plants, and should be procured at the proper season, so as to have it in a fit state for use when wanted, for nothing is more disheartening to gardeners, or worse economy on the part of employers, than being without suitable soil in a fit state for use, with which to pot plants at the proper time. Stove plants flowering in the conservatory will require attention to prevent their being injured by damp, especially Achimenes and Clerodendrons, which should be gone over every day in cloudy weather, carefully picking off decayed flowers, &c. Any of the twiners on the roof which have done flowering may be thinned out, so as to prevent their shading the house too much; for, after this season, permanent shade should be avoided as much as possible. Cold Pits.—Young stock, intended to flower next season, should be exposed to the midday sun, in order to ripen the wood, taking care not to do this so rashly as to injure the foliage. This, however, will only be proper in the case of such things as have already made plenty of young wood; but it is advisable after this season to be anticipating the approach of winter, and to use every possible means to forward the growth of valuable hard-wooded plants, in order to get it somewhat firm and able to resist damp, &c., as soon as possible; and this is especially necessary where the plants have to be wintered in these structures.

FORCING DEPARTMENT.

Pinery.—Those who think of trying the Meudon system of growing Pines cannot commence at a more favourable period of the year than the present, for there is now no chance of hot, dry weather, to cause the plants to start prematurely into fruit, as is sometimes the case, to the disappointment of beginners and the undue discredit of the system. The bed of soil should be from 18 inches to 2 feet deep, and should consist principally of sandy, turfy loam, with a little leaf-mould or rich peat mixed with a liberal proportion of sharp sand, so as to ensure its taking water, if it is ever from any cause allowed to get dry; for if turfy loam and peat in a rough state are used, and ever get dry, it is nearly impossible to thoroughly moisten the bed again; but if moderately fine soil is used, and carefully mixed with a proper proportion of sand, water will penetrate the mass freely, instead of passing off between the lumps, and the roots will be nearly as much under command as to moisture as those growing in pots. Persons commencing this method of cultivation should also be careful not to plant out pot-bound stock; for such, whether young or old, seldom strike root freely into the soil, but are almost sure to fruit prematurely. For persons who grow Pines largely, and have several houses, or separately heated compartments, devoted to their culture, this system has many advantages over pot culture; but where a regular supply of fruit has to be furnished from a moderate number of plants, and some two houses, we would still prefer the old pot system of cultivating them. Vineries. — Young Vines planted out this season have, in many cases, made very unsatisfactory growth so far, owing, no doubt, to the unusually cold season. Where the border is composed of strong adhesive or clayey loam, it is almost sure to be too wet for the healthy action of the roots—such, at least, has been the case in our own experience—and we have just covered the border with warm stable litter, extending it as far across the border as the roots reach. This has been applied only about a fortnight, and it is astonishing how the Vines have strengthened in that time, and they are also growing rapidly. There is, however, very considerable danger in applying fermenting materials to a recently made border, especially if it contains much undecayed vegetable matter; for if fermentation takes place in the soil, the roots will be ruined; therefore, the litter must be watched, and not allowed to heat too strongly. Plants in pots should on no account be allowed to remain in houses where the fruit is ripe, for every precaution will be necessary this season to prevent damp. Melons.—These will require close attention, for the season has been anything but favourable for their culture. Keep the late plants thin of wood, and never allow any useless spray to crowd the principal shoots or leaves. Endeavour to maintain a regular bottom heat, and also to secure sufficient atmospheric warmth to allow of giving air freely for a few hours every day. Remove decaying leaves immediately they are perceived, and use every means to keep the plants perfectly clear of insects. Be careful not to keep the soil about the collars of the plants too damp, which, after this season, is apt to induce canker.

FLOWER GARDEN AND SHRUBBERIES.

In many neighbourhoods green fly is still very troublesome on the Verbenas, &c. We have used tobacco water and soap-suds with success, and have got rid of the enemy at no great expense, and can recommend nothing cheaper or more efficient to those whose plants are still infested. The strength of the mixture should be tested by dipping some of the worst infested shoots into it, and used sufficiently strong to kill the insects, but not so strong as to injure the leaves. It should be applied in the evening, when there is a prospect of a dry night, using a fine syringe, or fine-rosed watering-pot, and giving enough to moisten the whole of the foliage. Go over the beds frequently, and remedy any defect that may be perceptible, without loss of time, for the bedding out plants are enjoyed but for a comparatively short season; and now that they are in full beauty, every means should be used to render them as enjoyable as possible, by maintaining the most perfect order and neatness. Where the stock is clean and growing vigorously, this will involve considerable labour, and it will be necessary to go over the beds frequently, pegging down where necessary, removing decayed flowers, and cutting back such of the shoots as may incline to encroach upon the edging of the beds. Keep herbaceous plants neatly tied up, and cut off the flower stems of any that are becoming unsightly. Take advantage of every leisure hour to put in cuttings, and use every possible despatch with this work until there is a good stock in a fair way for rooting of such things as are known to be difficult to winter except in well-established plants. Keep gravel walks perfectly clean and smooth by weeding, sweeping, and rolling, as may be necessary. Keep climbers on walls within due limits.

FLORISTS' FLOWERS.

Propagate Hollyhocks by cuttings. Mark good seedlings, digging up all single and semi-double varieties. Take off the tops of seedling spikes, if not already done when the named sorts were; it throws strength into the remaining flowers, and encourages the formation and growth of the seed. Should hot weather set in, which is very likely, take care that newly formed beds of Pinks and Pansies do not suffer from drought. Prick out seedling Pansies on well prepared beds. Carnations and Picotees should be layered; gentle waterings will be required, and the pots must be kept free from weeds; pull out decayed petals from those calyxes where seed pods are forming, otherwise wet will lodge and the seed perish. Prepare the Tulip bed by frequent turnings; add, if required, fresh compost, but avoid dung as you would poison.

HARDY FRUIT AND KITCHEN GARDEN.

The prevalence of damp cloudy weather is causing an excessive amount of growth in fruit trees; and, excepting such as are bearing a good crop of fruit, they have in most cases already made as much or more young wood than there is much chance of getting matured in the course of the autumn. It will therefore be advisable to go over the trees and stop about half the shoots, beginning of course with the strongest; for a general stopping at this time would probably be of little farther service than to induce the production of a mass of useless spray, whereas stopping the stronger shoots or those which incline to grossness, will divert the sap into the weaker ones, which will be strengthened, while the buds on the shoots that have been stopped will become full and plump without starting into growth. The only effectual method, however, of curing a gross habit of growth, when this is the case in ordinary seasons, is root pruning, or keeping the roots within proper limits by means of shallow well drained borders. And should it be found that the shoots after stopping incline to start into growth, it will be advisable as soon as the fruit is gathered to open a trench at a moderate distance from the stem of the tree, cutting the stronger roots. This will be of the greatest service in checking growth, and will probably do more towards securing ripe wood than anything else that could be adopted. Get the Strawberry plantations intended to stand for next season trimmed as soon as convenient, cutting off and clearing away the runners, &c., so as to afford the leaves plenty of room. Attend to providing plenty of Lettuce, Endive, &c., for winter salads; also see that there is a good bed of Parsley provided in some sheltered spot where it can readily be protected in severe weather. Collect and dry horse droppings for making a Mushroon bed. Keep the droppings spread thinly in a dry airy shed, and turn them frequently; for unless they are well dried it is difficult at this season to prevent the bed heating excessively, and this should be guarded against, as it exhausts the manure, and then there is only a poor chance of a good crop.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 17, 1854, as observed at the Horticultural Gardens.

August.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.
Friday 11	17	29.947	29.934	75	58	66.5	62	62	W.	.00
Satur. 12	18	29.924	29.897	74	48	61.0	63	63	S.W.	.00
Sunday 13	19	29.902	29.731	86	54	70.0	63	63	S.	.01
Mon.. 14	20	29.836	29.726	72	52	62.0	64	63½	S.W.	.00

Aug. 11—Very fine; partially clouded at night.
— 12—Densely clouded; cloudy and fine; very clear.
— 13—Very fine; much overcast at night.
— 14—Cloudy and fine; very fine; clear.
— 15—Very clear; cloudy and fine; clear.
— 16—Fine; cloudy; much overcast.
— 17—Fine; rain; very clear.
Mean temperature of the week, 2 deg. below the average.

RECORD OF THE WEATHER AT CHISWICK.
During the last 28 years, for the ensuing week, ending Aug. 26, 1854.

August.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 20	72.7	51.6	62.1	12	0.33 in.	2	1	1	—	5	7	10	2
Mon. 21	72.3	50.4	61.4	10	0.62	3	2	1	1	6	7	7	1
Tues. 22	70.9	51.5	61.2	12	0.67	1	2	2	—	4	10	8	1
Wed. 23	71.0	49.0	60.0	15	0.95	1	3	1	—	3	9	9	2
Thurs. 24	70.8	47.9	59.3	14	0.23	1	6	1	—	5	6	6	3
Friday 25	70.8	51.5	61.1	12	0.32	2	2	1	1	6	9	4	3
Satur. 26	72.0	49.1	60.5	10	0.51	—	2	3	—	6	8	5	4

The highest temperature during the above period occurred on the 20th, 1826, and 21st, 1835—therm. 88 deg.; and the lowest on the 21st, 1850—therm. 32 deg.

Notices to Correspondents.

Ægilopian Wheat: *G Jackson.* M. Fabre's account of his experiments is translated in the last Number of the Journal of the Royal Agricultural Society.

Asparagus Kale: *W H F C.* This is the same as Jerusalem or Buda Kale. It is almost too late to sow seed of it now, as the last plantation for the latest gatherings should be made by this time. Besides, being a good winter green, furnishing a supply much longer than most of the others, and *requiring exactly the same kind of treatment,* it may also be blanched as you would do Seakale by turning a pot over it, and covering it with tree leaves, over which a little rough dung may be put to keep them from blowing about. When cut and dressed in a blanched state it is said to be excellent; and one advantage of this plan is that the same plants will furnish two cuttings, for the sprouts are reported to be even more delicate than the original heart of the plant. Thus it may be made a good substitute for Seakale. ‡

Books: *E M.* "School Botany" is the best book you can have to begin with.—*H H.* Mrs. Loudon's "Every Lady her own Gardener" may possibly answer your purpose. ‡

Climbers: *Reader.* You may try the following in your greenhouse. Mandevilla suaveolens, Kennedya Marryattæ, Hardenbergia macrophylla and monophylla, Tecoma jasminoides, and Tropæolum Triomphe de Gand. ‡

Glass: *Lafleur.* By all means use Hartley's patent rough plate.

Insects: *Coniferæ* will be obliged by some of our correspondents informing him which is the best way of getting rid of the insects that are attacking the Coniferous plants this year.

Names of Plants: *Exeroum.* 24, Gymnandra armena, a fine thing and great rarity. Have you it in fruit? 70, Globularia vulgaris; 995, Valeriana montana; 610, V. Dioscoridis; 621, V. officinalis; 1068, Adiantum Capillus; 1071, Asplenium trichomanes; 1069, Asplenium Ceterach.—*T G.* Ceratonia siliqua; the locust tree or Carob of Syria.—*A S.* Humea elegans.—*J Weeks and Co.* No one can name Melastomaceous plants by the leaves alone.—*J W Carson.* We never before saw your Aerides, but we can scarcely doubt that it is a white variety of A. quinquevulnerum.—*T M.* Asparagus lucidus.—*J Summerfield.* Rodriguezia secunda.

Parasites' Nests: *G U S.* We have seen the specimen of these curious productions presented to the Horticultural Society by Dr. Luna, of Guatemala, and it is by far the finest specimen of the kind which has come under our observation. The donor will no doubt be thanked officially in due time.

Peas: *J Evershed.* Your Long Jonquil is an excellent Marrow Pea, very full in the pod, sweet, and as tender as Knight's Marrow itself.

Potatoes: *J Hayes.* They are *very* fine Potatoes. But your experiment in stopping the disease will hardly be satisfactory this year, when so little disease exists in our part of England. —*R V S.* Much obliged by your communication; but we invariably decline publishing an account of "secret remedies." As to the statement made by Mr. Cuthill in the *Times,* it is at least premature. We have seen very little disease as yet. Of course it *may* appear, for there is plenty of time, in late crops.

Misc: *A B.* We do not publish supplements.

UPPER PERUVIAN GUANO ON SALE.—Apply to W. & J. RAVENSCROFT & Co., Liverpool.
Extract from a Report of Dr. Ure, F.R.S., &c.
"Your Upper Peruvian Guano is worthy of all commendation"
Extract from the Report of George Longton, Esq.
"RAVENSCROFT'S Upper Peruvian Guano will last longer, and eventually do more good than Gibbs', or any other I have ever tried. It possesses the very finest qualities of both Guano and Bone Dust."

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodoriser and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

LONG SUTTON RAM SHOW.
MR. JOHN CLARKE has the pleasure to inform the BREEDERS of SHEEP that his ANNUAL SHOW of RAMS will take place on WEDNESDAY, SEPTEMBER 13, when the favour of their company will be highly esteemed. The Rams will be penned at 12 o'clock. Luncheon from 1 to half-past 2 o'clock. Letting by Auction immediately afterwards.
Arrangements will be made to meet the Wisbeach 12 and 12.40 down, and the 7.5 up Trains; also the Spalding 11.45 and 12.23 morning, and the 8.5 evening Trains.
Long Sutton, Lincolnshire, August 19.

MANCHESTER AND LIVERPOOL AGRICULTURAL SOCIETY.—The Annual Show of this Society will be held at Altrincham on FRIDAY, September 8. Thirteen Prizes are given for HORNED CATTLE, HORSES, and SHEEP, for general competition. In addition to which the local committee at Altrincham, out of spec al funds raised for the purpose, offer Prizes for CHEESE made in Cheshire or Lancashire, and prizes for POULTRY, HORSES, SHEEP, PIGS, and VEGETABLES, for general competition.
IMPLEMENTS and MISCELLANEOUS ARTICLES from any part of the kingdom may be shown, and Prizes or Medals will be given for such as are considered by the judges entitled to the same. There is expected to be a trial of REAPING MACHINES about the 1st of September, for which prizes are offered.
Entries must be made for the Reapers on or before the 25th August, and for Live Stock, Implements, &c., on or before the 1st September, but competitors are requested to send their entries sooner.
The SPECIAL GENERAL MEETING to award the prizes in classes 1, 2, and 3 (farms, crops, and long servitude), will be at the Unicorn Inn, Altrincham, August 31st, at 10 a.m.
The DINNER will be in the Town Hall, Altrincham, on the day of the Show, at 5 p.m. The Earl of Stamford and Warrington is expected to preside.
Prize Lists, Rules, and any other information may be had by applying to the secretary. HENRY WHITE,
Warrington, August 19. Secretary.

The Agricultural Gazette.

SATURDAY, AUGUST 19, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, August 24—Agricultural Imp. Society of Ireland.

It should have been stated that the reports of harvest prospects, published a fortnight ago in our columns, were dated July 29. Since that time the weather, especially in the south of England, has in some districts considerably affected the grain crops, and we have received letters from several quarters in which, independently of this cause, the Wheat crop appears to have suffered materially during the present month. One of these we publish in another column. Notwithstanding these notices, however, our impression, founded upon a hurried observation of a large portion of the country, remains as before, that the Wheat crop will prove unusually productive. We shall be much obliged to any of our correspondents who may have seen reason to change the opinions they expressed a fortnight ago, for any further report which the case may require.

The following errors which we correct here, crept into the report at page 506. Mr. HORSFALL's report of the Oat crop in Wharfdale, Yorkshire, was "unusually good; one-third to one-fifth more than an average." Mr. FENN, of Beccles, Suffolk, whose name was misprinted "SPENCE," reported of the Barley crop in his neighbourhood that it was "generally very excellent." These reports, by some mingling of the returns, occasioned by the very hurried manner in which unavoidably they were epitomised, were printed respectively as "not average," and "generally short."

THE main argument urged at the last meeting of the London Farmers' Club, in favour of the system which our LABOURERS' FRIEND SOCIETIES adopt of rewarding good character, hinged upon the advantage of the meetings for that purpose in bringing all classes in any locality together—the landowner, clergyman, professional gentlemen, farmers, tradesmen, and labourers—and uniting all in a common object on which all could think, and in which all would act, alike. One of the speakers, we remember, stated that the annual meetings of the society in his locality were the days of all others which he would least willingly lose out of the year for their moral influence on the neighbourhood—that the pulpit addresses on the Sunday to the habitual congregation of the place were not to be compared in value to the addresses of the clergymen and gentlemen on occasions such as these afforded, when a congregation all alive to the influences of the meeting, and predisposed to good impressions, listened to the exhortations and encomiums of their employers and others, who were evidently interested in their well-being. It is plain that the argument altogether fails. The value and success of such meetings may be, and we believe they are, unquestionable—quite as important as their keenest advocate asserts—but they are entirely independent of that division of the prize lists of these societies to which we have objected. Such gatherings, quite as social, cordial, and beneficial to all concerned, take place in localities where rewards for families brought up without parish relief would be considered a positive insult by the cottagers and labourers; and where the offer of a money reward for honesty, or sobriety, or kindness to relations, so far from producing the good effects which are expected of them here, would do little more than excite a mixture of amusement, shame, and anger, varying in the proportion of its ingredients according to the temperament of the persons so addressed.

We lately had the pleasure of attending the annual show of the Currie Horticultural Society, held in the parish school and the grounds surrounding it of the village of Currie, near Edinburgh. The population of seven parishes were assembled in the rooms, in the tent, and under the trees. Sir W. GIBSON CRAIG, Lord CURRIEHILL one of the judges of the Court of Session, and others representing the landowners of the district—the clergyman of the parish, and ministers of other denominations—the schoolmaster and other office-bearers of the Society—the manufacturers and farmers of the neighbourhood, and a large number of labouring men and their families were present.

The day appeared one of thorough enjoyment to everybody; for the eye there were the faces of friends, the very large and admirable collection of flowers and fruit, and vegetables, contributed for the most part by the cottagers of the neighbourhood, and the beautiful village scene, upon a sunny day—road and bridge and stream, kirk and manse and school, cottages and trees, scattered amid light and shade, over uneven ground; for the ear there was the military band, more vigorous, perhaps, than musical, the general buzz of conversation, any articulate portion of which that reached you having reference generally to the prizes won and the objects shown by the speaker or his friends; and, lastly, there was the noisy Water-of-Leith running in its rocky bed close by. And apart from the mere pleasure of the meeting, the general impression could not fail to be, that it was one of as much social usefulness as any to which the speakers at the Farmers' Club referred. Here, surely, were "all classes united in a common object, one in which all could think and aim alike," and from the highest to the lowest there, we are sure that all were benefited. There was much less of that patronising effort for the benefit of others apparent than one sees in meetings of the Labourers' Friend Societies here; the class who came to do good, and the class who came to receive it were not distinguishable—one did not see the aristocracy on one side and the "clean smiling faces and white smock frocks" on the other, which characterise the descriptions of such gatherings here—words which are all very well applied to children, but simply ridiculous when used as we have heard them in reference to men. And when the whole assembly gathered in the field around the officers of the Society, and the awards were announced and the prizes were awarded, and Lord CURRIEHILL stood forward to congratulate those who had succeeded and encourage those who had failed—to speak of the humanising influence of horticultural pursuits and pleasures, and of those features of the character, such as patience, perseverance, humility, and simplicity, as well as energy, skill, and intelligence, which might thus receive efficient education, he was listened to by men who with all their grateful and respectful attention to his words were, you could see, taking the measure of the speaker all the while, and weighing everything he said, receiving nothing on mere authority, and admitting only what commended itself to their own intelligence and judgment. There was much less noisy expression of feeling, and the meeting separated more quietly, than would have been the case in England; but as to the greater usefulness of gatherings such as this—where men treat one another as equals, or as capable of equality, on the ground of moral character, whatever differences there may be in social rank—there cannot be a doubt.

THE Drainage Bill of this session has been rejected by the House of Lords, after passing through the Commons with considerable discussion on its provisions.

It would appear from what Lord PORTMAN and Lord REDESDALE said, that drainage and land-improvement companies were a discredit rather than a benefit to the country, or why should a measure, supposed to emanate from one of them, be regarded with *suspicion*. The object of Mr. KER SEYMER'S Bill was simply to give facilities of outfall, and could only benefit a company when that company was set in motion by a landowner, and then only to the extent of enabling the work to be better executed than heretofore; for it should always be remembered that a company can do nothing without a customer, and its credit is often prejudiced by insufficiency of outfall—the first desideratum in all drainage works. Mr. MECHI remarked at Tiptree the other day, that every trade, and every branch of the community, excepting the landed interest, had its peculiar means, through class societies and private companies, of raising money for the development of the resources of each, while from that particular interest our London (Mr. MECHI referred to the city) capitalists held aloof. Can this be wondered at when we find Lord PORTMAN stating that, because Mr. KER SEYMER was chairman of the General Land-Drainage and Improvement Company, "the Bill should be regarded with suspicion," and my Lord REDESDALE opposing the bill, because—we hesitate to quote the words—"*it would facilitate the operations of a company.*"

We have no interest in the success of the company here alluded to any more than we have in the success of all such companies; but if the Legislature has sanctioned the establishment of these companies on the ground of the national uses and benefits which they offer, it is obviously a gross inconsistency to refuse such powers as are necessary to their efficiency in these respects, on such grounds as those urged by the opponents of the Drainage Bill in the House of Lords.

THE CIRCUMSTANCES OF THE SOIL.

"Why, I am master of my acres, man!—there's the advantage of being descended from a man of more sense than pride! They cannot oblige me to transmit my goods, chattels, and heritages any way but as I please. No string of heirs-of-entail as unsubstantial as the morsels of paper tied to the tail of a boy's kite!"
—*The Antiquary.*

It appears to me that public attention must, 'ere long, be turned, more energetically than at present is the case, to the consideration of what may be called, for want of a better name, the 'Circumstances of the Soil.' I mean by the phrase, those incidents which in this Country affect Land in reference to Man, in his various relations of Owner, Occupier, Laborer; Seller, Purchaser, Inheritor, Testator; with many other *'ers* and *'ors*, amongst which I would include, but cannot very well alliterate, those not less important relations to it arising out of Birth, Marriage, and Parentship.

A minute's reflection will convince any one, who may not have turned attention to it before, that, in every one of these relations, and probably in far more which no pen could precisely enumerate or define, the land we live on, the broad acres that go to make up what we call our country—England, Wales, Scotland, or Ireland, whichever it may be, constitute an article the "circumstances" affecting which, must also affect and interpenetrate the vital action of society in some of its most important functions, and consequently *every individual* of which society is composed, in a greater or less degree, or rather in a degree more or less *direct*, yet omitting none.

But if this be the case, and if it be also the case, that Land is pre-eminently the Creature of Law and Custom, omitting all mention of Prejudice right or wrong, and Tradition true or false,—how very important it would appear, must those Laws and Customs be, in the influence they exercise, *material* certainly, *moral* we may perhaps see, throughout the various limbs, joints, sinews, and nerves of the "body politic!" So various, indeed, so complex, and so extensive are the ties which connect us, each and all, with the soil, that this very circum

stance perhaps interferes with that keen and active exercise of public opinion upon the subject which would otherwise form and show itself. Like Gulliver in Lilliput, we cannot see the ties that tie us down to it, the filaments are so many and minute; nor see who tied them, what manner of men they be, and whether friends or foes. Like the lifeblood that circulates in our veins, we cannot see, or trace, or even feel it, it is so entirely a part of ourselves: so that it was a matter of "discovery," and very late discovery, to men that in fact it "circulated" at all.

And thus it happens that Reformations, and Revolutions, and Restorations, and Magna Chartas, and Bills of Rights, and Parliamentary Reforms, and Financial Reforms, and Emancipations—Catholic, Secular, and Servile—and Freedom of Trade, and Freedom of Traffic, and every other kind of Freedom and Reform shall be vindicated and achieved in the freest of free countries; and yet at the bottom of it all, for the freedom of the land *itself*, there shall be left, as in Pandora's box, nothing but Hope.

When the Corn-laws were abolished a large portion of the public press, especially of the most liberal party, gave vent to pæans and rejoicings, as though a fundamental and complete emancipation had been effected from the whole system of what they called the Feudal Restrictions that had pressed upon the soil. I believe, on the contrary, that had the cycle of low prices continued a few years longer (which circumstances partly natural, partly accidental, have relieved) it would have been found that the abolition of those restrictive laws was like the tearing off the covering of fetters whose galling would only then have become plainly perceived, and no longer supportable; and that the true shape and material, and every twist of the *coil* would have been developed in a manner highly edifying to the general public; to the legal world not at all surprising; to the "landed" community very much so, especially on discovering that the concatenation was of their own forging for their own wearing; a rather heavy incumbrance to their own bones, yet furnished with a fleece, bearing skin very profitable to those who have the shearing of it. *Sic vos non vobis vellera fertis oves.*

The shearers are the lawyers, you guess; very good: but let us not be hard upon the lawyers. To do them but justice, they have of late years, aye! and for many years, both written and spoken upon this subject, in Parliament and elsewhere,* with a penetration and an honesty that justifies wisdom of her children, and shines in astounding contrast with the obtuseness, equally uncomprehensive and incomprehensible, of those most truly and personally interested in the matter: *alone* interested I will not say, inasmuch as an evil however self-inflicted, hugged, and dissembled, like the Spartan fox, by the wearer, does not, as it eats into his own vitals, injure himself alone, but all who depend on, deal with, or are connected with him. The lawyers are not unwise in their generation; for (as the world only half knows yet) the disinterested man, fully more than the selfish, gathers where he seems to scatter.

In every transaction, in this country, between man and man, of which land is the subject, there is an expense, delay, and complication, whose united effect is to lower its value, to arrest its improvement, to lock up capital away from it, to deter the purchaser, and to cripple the resources of the owner. This is felt by thousands, who acknowledge it, but cannot understand it, and by thousands more who do neither one nor the other. But if they would trace the history of the soil, they would see the reason why. The commercial and the feudal principle are two things as incompatible as fire and water, as Light and Darkness. And while the former principle applies to *every other* thing we buy, sell, own, occupy, enjoy, or bequeath, the latter is retained upon the soil *alone;* reminding one of that dark ray which chemists and astronomers tell of, as intersecting the solar light in certain mysterious places. The advocates of the feudal principle admit this, and endeavour to defend it, and to set up for land the claim of an exception. But their arguments are always (and of necessity) arguments of political or social expediency, they openly refuse to argue it on principle.

But even were it otherwise—were the exemption of land from the operation of commerce based upon some real and solid *principle*, that ought to be able to show that the principle is capable of confined and isolated application to that for which they claim it, and that it shall not extend *beyond their own intention*, or come into conflict with the other principle at points out of their own chosen line of demarcation. In a word, if the land were, as in feudal days it was, surrounded by an atmosphere of feudalism, feudalism applied to land would still be, as it then was, no grievance. When land was virtually intransferable, difficulties, delays and expenses of transfer were no cruelty, for they had no existence; and when no one had the power of devising or bequeathing it, and there was little or nothing of what we call personal property to bequeath, it caused no inconvenience or conflict, if land, the only possession known, had a way of its own of descending from eldest son to eldest son, because no statute law existed distributing everything else in a different way. Little did the sternest feudalist of feudal days dream of such an absurdity as that Land should one day come to be commercially transferable and divisible by the act or will of the owner, yet indivisible by the act of the law.

* I may especially instance the Law Amendment Society, and several pamphlets written by eminent conveyancers and country solicitors.

FINGER AND TOE IN ROOT CROPS.

By JAMES BUCKMAN, F.G.S., F.L.S.

THE so-called disease of finger and toe in root crops is a subject which has for a long time occupied the attention of those connected with agriculture, but apparently without at all settling the questions as to its nature and origin, as we find that up to the present time one section of practical men hold the opinion that the malformation of the root, which has given rise to the designation, is caused by uneven manuring; another, that it is due to the presence of stones, or a want of due pulverisation of the soil; whilst a third attributes the whole matter to attacks of insects.

Fig. 1.—Finger and toe in cultivated white Carrot, one half natural size.

Now, this discrepancy of opinion results from a variety of causes, the most prominent of which is a want of agreement as to the nature of the matter under investigation, inasmuch as we find that it is not restricted to a designation of that peculiar branching or growing of the roots in a digitate form, from which the term finger and toe is derived; but the excrescences caused by the bulging out of the root around the larvæ of insects, cracking and splitting of the root, and bletting or rotting of its parts, are all somehow or another included in the category of finger and toe; and though it is possible that most of these may be found to operate under some of the circumstances by which the peculiarity of growth it is my present object to describe is produced, yet the following remarks are meant to apply only to an explanation of the facts connected with the branching or forked method of growth of some roots, as Parsnips, Carrots, and Turnips (see accompanying drawings 1 and 2), as distinguished from the smooth outline and unbranched condition which mark well-developed root crops.

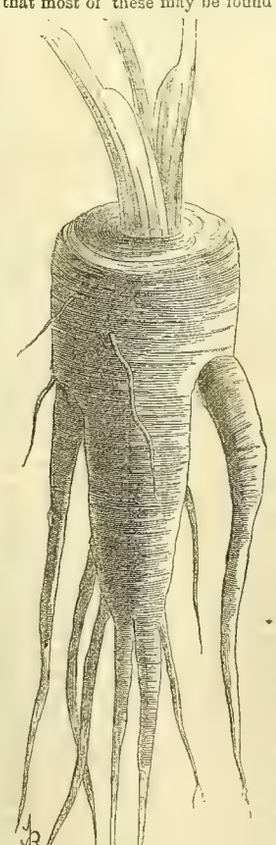

Fig. 2.—Finger and toe in cultivated Parsnip, one half natural size.

As my conclusions upon this subject have been arrived at in experimenting upon the growth of cultivated roots from wild kinds, I shall, in illustrating the subject, describe—1st, Some experiments on the growth of wild roots, and the conclusions I have been led to in consequence of my observations upon these. 2d, I shall attempt to show that the history of root crops confirms the view of "finger and toe," to which such experiments have led.

1st. *Experiments with Wild Roots, &c.*—In the spring of 1848 I planted two of my experimental plots with seeds of the Pastinaca sativa (Parsnip), and Daucus carota (Carrot), both of which grow spontaneously in the garden precincts; the seeds were gathered in the previous summer from wild plants. On being sown, both species came up well; but as they advanced, many of the specimens showed a disposition to run to seed the first year; and as seed from these would have been of no use in my after experiments, which were designed to enable me to note the effect of cultivation upon wild specimens, the plants in which the running disposition showed itself were hoed out. An examination of the crop in the autumn showed, in the Parsnips more particularly, some interesting results, the most prominent of which were, that whilst most of the specimens presented the dark green hairy leaves peculiar to the wild plant, there were a few examples in which the foliage had assumed the light green and smooth aspect, devoid of hairs, which characterises the cultivated plant; and amongst the latter there were a few with larger leaves and broader divisions or leaf-lobes than the rest, the leaves, too, all growing symmetrically around one central bud, whilst others showed a disposition to throw up more buds than one. Here, then, it was evident that the examples with the single central bud were best calculated to carry on the experiments, and consequently the remainder were rooted out, when it was observed that the roots were for the most part more fleshy than those of quite wild examples; and while they were as much forked as wild roots (see drawing 3), the increased fleshiness extended to the forks equally with the larger part. *From the Journal of the English Agricultural Society.*

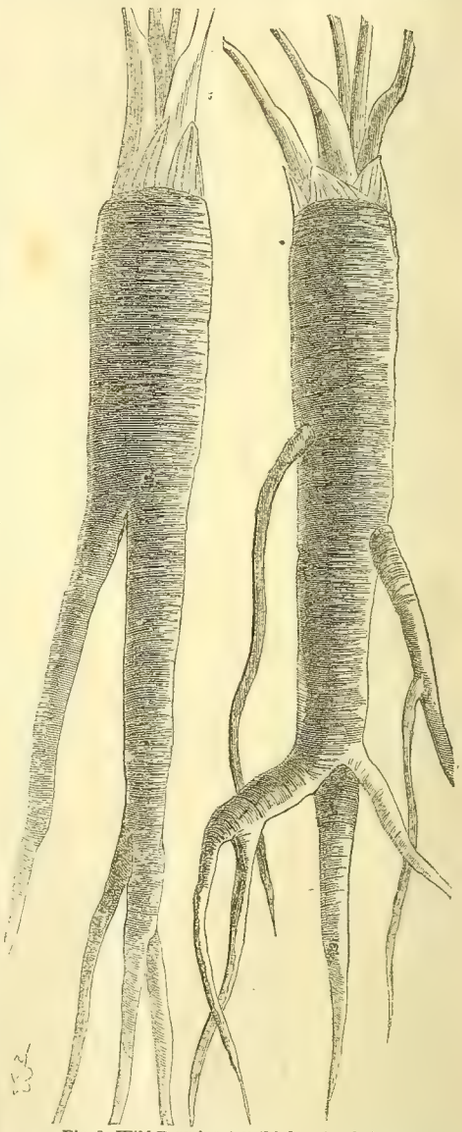

Fig. 3. Wild Parsnips, two thirds natural size.

(*To be continued.*)

THE HOME GROWTH OF FLAX.

[MR. FANE has issued a circular on this subject, having especial reference to a discovery by Mr. Pownall, of the advantages of washing the Flax previous to the entire completion of the retting process. We extract this portion from his address.]

THE preliminary paragraphs relate to the products of the crop—1. Oil; 2. Oil-cake; 3. Fibre; to the quantity of Flax fibre used in this country—70,000 tons grown, 80,000 imported; to the whole value of the fibre and of the seed belonging to it—9,840,000*l*; to the processes to which the crop, after being pulled, is subjected—1. Seeding; 2. Steeping; 3. Drying; 4. Scutching; to the mismanagement of which it has hitherto been the subject, so that whilst in England Flax has been cultivated principally for the seed, and the fibre has been neglected, in Ireland it has been cultivated so exclusively for the fibre that the seed has often been thrown away; then in some detail to the proper methods to be pursued in the cultivation of the crop; and, lastly, to the division of labour between the sowing of the seed and the delivery of its produce in a condition fit for use in the linen manufactory. The farmer should not steep or scutch, only grow. The manufacturer should steep and scutch

in mills, where steeping may be in hot water all the year round. Here we commence our extract from the address :—

"The steeping, the drying, and the scutching of the straw, the dressing the fibre after scutching, the second and more careful dressing of the fibre by heckling or combing, the sorting, the spinning, the weaving, the bleaching, and the finishing, are evidently all manufacturing, not agricultural operations. One circumstance, however, has until lately prevented the application of manufacturing principles, including that invaluable one —which is the basis of all cheapness—the division of labour to the first four of the above processes, to the steeping, the drying, and the scutching of the straw, and the first dressing of the fibre, which have in consequence been almost exclusively parts of the agricultural industry of the country. That circumstance is, that until lately the steeping could not be carried on throughout the year, the process of steeping depending on the heat given to water by the autumnal sun, without which the necessary fermentation could not be got up ; and hence it followed, that, as the steeping was, of necessity, a farming and local operation, the processes immediately connected with it—drying, scutching, and dressing after scutching—became local and farming operations also. Now, it is well known, that it is only by our great superiority in capital and machinery that we are able in any branch of industry to undersell foreigners. In the Flax industry we have been able to undersell them easily in spinning, our spinning machinery is so superior to theirs, but in no other part. The foreigner can produce and send here the raw material more cheaply than we can ; and when we have heckled it, sorted it, and spun it into yarn, and the yarn has been exported, the foreigner can weave the exported yarn into linen, bleach it, and finish it as cheaply as we can. In the earlier parts—that is, the growing and roughly preparing the raw material—they can excel us ; in the middle we far excel them ; and, in the latter parts, the weaving and the rest, they can at least equal us. The contest is severe. What, then, is the policy we ought to pursue in this contest ? Cheapen, if possible, the earlier parts of the process ? Cheapness at the commencement is more effective than at any of the later processes ; but how can we cheapen the earlier parts of the process ? There is one way, and one only, and that is, by making them manufacturing, not agricultural processes. The farmer must be confined to the growing and harvesting of the crop ; and the steeping, drying, scutching, and rough dressing, must be made as much manufacturing processes as all the later ones now are. As soon as they are made manufacturing processes, the principle of the division of labour may be fully carried out ; effective machinery will be used, and all the elements of cheapness belonging to manufacturing industry, including the concentration of labour under one roof, will be brought into action.

"Two movements in advance in this direction have been made within these three or four years ; one unsuccessful, the other rather successful. The first was the invention of a Mr. Schenk, who conceived the idea of steeping in water artificially heated, which, of course, involved the possibility of steeping all the year round, and took out a patent for it. The idea was plausible, and many mills were erected in Ireland to carry it out, but it was not found to answer. Two practical objections presented themselves : one, that the fibre appeared to be weakened by the hot-water fermentation, which seemed almost always to have gone too far ; and the other, that a most offensive matter adhered to the straw, and, when the straw had been dried and the scutching commenced, the scutchers could not bear the smell of the almost putrid dust which flew off. The result was, that hot-water steeping was being abandoned.

"The other movement in advance was, the substitution of scutching by machinery moved by water or steam power, for scutching by hand ; which was so successful that Acts of Parliament were passed to facilitate the putting up scutching mills ; many have been put up, and more are in course of erection.

"Both these were movements in the right direction, and in the most essential part, because in that part, wherein foreigners had the advantage ; but the failure of the first, the steeping in hot water, precluded the effectual carrying out of the main object, namely, the substitution of manufacturing cheapness for agricultural dearness.

"At this juncture, an English gentleman, a Mr. Pownall, in endeavouring to work out Mr. Claussen's idea of obtaining from Flax a fibre that would spin on cotton machinery, made a most valuable discovery, as to the preparing of Flax for the common linen purposes, which was this, that if the flax straw, when taken out of the water in which it had been steeped and fermented, were instantly, and before drying, subjected to severe pressure and a stream of cold water, the pressure would press out, and the water would wash away, almost all the gluten remaining in the plant not removed by the fermentation.

"It is almost impossible to over-estimate the value of this discovery. The grand difficulty in the management of the Flax plant had always been the difficulty of hitting the happy mean between over-fermenting and under-fermenting the straw. If the straw were not fermented enough, the gluten was not sufficiently discharged, and then the woody parts of the plant stuck to the fibre so strongly, that nothing short of violent blows of the scutching instrument would remove it, and violent blows broke much of the fibre into short lengths, called tow, of little or no value. On the other hand, if the straw were fermented too much, then the gluten was indeed sufficiently discharged, and moderate blows sufficed to remove the woody matter ; but in that case the fibre was weakened, and the blows, moderate as they were, again broke the fibre into tow. In either case the yield of valuable fibre was unsatisfactory, and the reed and quality deteriorated, and it was only in those cases where the exercise of the greatest care and judgment had enabled the steeper to trim most happily between fermenting too much and fermenting too little, that a satisfactory yield of fibre was obtained. Mr. Pownall's discovery at once triumphed over this hitherto almost insuperable difficulty, because it enabled him to stop short in the process of fermentation before he arrived at the point of danger, and yet remove the gluten even more effectually than excessive fermentation had previously done ; from which there resulted the following advantages :—1. The squeezing and washing so completely cleansed the fermented straw, that the objection to Schenk's hot-water system, arising from the putrid matter adhering to the straw, and flying off from the straw in dust in scutching at once disappeared ; and hence the mills erected for hot-water steeping resumed work, and no impediment now exists to steeping being carried on all the year round. 2. Fermentation need never be carried beyond the perfectly safe point, and hence the fibre is not weakened. 3. The woody matter is easily removed by moderate blows of the scutching instrument, because the sticky matter no longer impedes the operation, and hence the yield of fibre is much greater. 4. The fibre obtained is of a singularly soft and pliable character, and is much preferred by the spinner. 5. The subsequent process of bleaching is greatly facilitated, because it is the gluten which remains in the fibre, which resists the action of bleaching ingredients, and under Mr. Pownall's process the gluten is effectually removed.

"It is obvious that with Mr. Pownall's discovery there remains no longer any natural impediment to the carrying out of the great principle, the great element of cheapness, the division of labour ; nothing to prevent the farmer from producing the raw produce, and stopping there, and leaving all the manufacturing operations, from the steeping downwards, to the manufacturer; nothing to prevent manufacturers from establishing, with the aid of the landed interest, steeping mills in every favourable locality, and thus introducing into the farming rotation a most valuable crop, which, if proper use is made of the seed by using it at home as animal food, cannot fail to refertilise the land that supplies it. But though there is no longer any natural impediment, there is an artificial one—an impediment created by the law of unlimited liability ; which, by threatening every gentleman of property with the possible loss of 'his last acre and last shilling' (as the phrase is), if he presumes to go shares with others in raising capital for a common purpose, effectually deters them from lending a helping hand to this most useful and patriotic work.

"The desire to grow Flax has long pervaded the agricultural community, and lately it has become quite a passion. All farmers know the value of the seed for feeding, and of the fibre for manufacturing purposes. All feel that they could make excellent use of the seed at home, by crushing it, making it into compound with other food less rich—fattening their animals—enriching their manure—and re-fertilising their land ; but what are they to do with the straw ? Nobody will buy it. Valuable as it is, capable of being converted into fibre worth 50*l*., 60*l*., 80*l*., and even 100*l*. a ton, still nobody will buy it, because there is no steeping and scutching mill within cartage distance. As regards the straw of the Flax, their position is what it would be as to corn, if there were no mill to grind it within 50 or 100 miles ; only that it is worse, because, in the case of corn, they cart to the mill the non-bulky and valuable part, the seed, and keep the bulky part, the straw, at home ; whereas, in the case of Flax, their object is to keep the non-bulky part, the seed, at home, and cart away the bulky part. It is obvious that this cartage difficulty is one not to be overcome but in one way, to be illustrated by the old proverb, 'If the mountain won't come to Mahomet, Mahomet must go to the mountain ;' in other words, as the straw cannot be carted by the farmer to the distant mill, the mill must come to the farmer.

"But how is this to be brought about ? The farmer and steeper have long been trying to get together ; the farmer saying to the steeper, 'if you will put up a mill near me, I will grow the Flax ;' and the steeper replying, 'No ; if you will grow the Flax, I will put up the mill ;' but neither has been willing to begin. It is obvious which ought to begin—the steeper—in a few instances he has, and whenever he has, Flax cultivation has followed instantly and extensively ; but the great difficulty is to get him to begin."

[The rest of the address is the announcement of a Joint Stock Company, having the above objects in view —which is clearly matter for publication, not here, but in our advertising columns.]

AGRICULTURAL CHEMISTRY.

ROYAL AGRICULTURAL COLLEGE.—SESSIONAL EXAMINATION. JUNE, 1854.

2. Write an essay on guano, with reference to the following points :—

a. Origin of guano.
b. Its distribution.
c. Different varieties.
d. Relative value of different varieties.
e. How to determine the commercial value of guano.
f. Adulterations of guano, and mode of recognising them.
g. Crops most benefited by guano, and crops to which it ought not to be used alone.
h. Substitutes for guano.

3. What is the effect of quicklime on fresh and on putrid urine?

[Extracts from the answers of Horatio Chancellor :—]

2. *Guano* is the solid excrements of sea-birds. It has been deposited year after year, and ultimately so collected as to constitute the now vast beds which occur in the several islands and countries of Peru, Patagonia, &c. *a*. The birds that have deposited their excrements lived on fishes, which in their turn lived on animalcules existing in the water, hence it is curious to observe the remains of these fishes, and infusorial animals in the guano, which are found in great abundance, and in many cases in an equally perfect and well preserved state.

b. Guano is found in great abundance in America, and adjacent isles, of course differing very much in extent and nature according to the difference in climate, food of birds, and subsequent circumstances to which it has been exposed. Extensive beds occur in the north and south of Southern America, hence the terms Peruvian, Patagonian, &c.

c. Among many varieties there seem to be the following deserving of attention, which are excessively varied in composition—the Peruvian, the Bolivian, the Saldanha-Bay, and the Patagonian, differing according to the place from whence they are shipped. There are many varieties of these, but those four may be said to comprehend all other guanos.

d. As to their relative value the first variety Peruvian, ranks undoubtedly as the best, as can be seen by the great difference in its composiposition ; it has been much less subjected to the wasting effects of rain, but its own samples vary, according to the depth of the bed from which it has been obtained, independent of any after-adulterations. The points which indicate the value of a specimen of guano are : *a*. Quantity of organic matter and relative amount of ammonia produced from such on decomposition ; *b*. The amount of phosphatic matters ; *c*. The amount of alkalies, as potash and soda and their salts.

A good sample of Peruvian guano should be expected to contain from 55—60 per cent. of organic matter, producing 16 per cent. of ammonia on decomposition ; 18—19 of phosphatic matters ; 6—7 of alkalies ; 2 of silica (not more), and not more than 12 per cent. of water.

A sample containing these valuable constituents, and in such proportions, would indicate Peruvian of not more value than any other, but frequently salts of lime somewhat diminish the per centage of those valuable constituents—as being a highly nitrogenised manure, and far more so than any of the other guanos, of course it is relatively of greater value; though, as will be seen in the Bolivian variety, the less amount of ammonia is well made up by the greater per centage of phosphates, thus becoming more valuable for root crops. A sample of Bolivian guano should be expected to contain 35—45 of organic matter, 25—38 of phosphates, 5—6 of alkalies, 2 of sand, and not more than 20 per cent. of water ; like Peruvian, however, it varies much, and frequently contains even a greater amount of ammonia than some Peruvian samples ; however, as seen by this analysis, it has far less on the average, and a greater per centage of water present ; the amount of phosphate, however, makes it a valuable manure for root crops, taking as it were the place of superphosphate.

Saldanha Bay variety is much inferior to either of the above, and frequently contains a great amount of lime and such like inferior constituents, with a proportional less amount of ammonia, &c. As, however, it can be obtained much cheaper, it frequently pays well. The Patagonian likewise contains much lime—as much in some cases as from 30 to 36 per cent. of gypsum —entirely independent of any adulteration, and like the former contains an equally diminished proportion of ammonia and phosphate. In some cases, however, it is much more valuable than in others, as sometimes, if obtained from the bottom of the bed, of course more lime is mixed up with it ; it is valuable as a manure for soils deficient in lime, acting as a good manure at the same time, but it has not the invigorating effect of the Peruvian.

e. As a means of determining its commercial value—the simple analysis of the proportions in which the valuable constituents exist—as those already mentioned—ammonia, phosphates, and alkalies—is much the safest policy, calculating, of course, the amount at the usual price per pound—in accordance with the price you would expect to pay for each ingredient in any other manure. 1st, As to the determining the quantity of nitrogen, and phosphoric acid, and alkalies—the nitrogen is easily determined by combustion in several ways [which we do not describe]. And supposing a sample of Peruvian to be analysed—and a certain quantity of ammonia is found ; you would calculate its value at 8*d*. per lb. The phosphates and alkalies would be determined by other means—[which we do not describe]. The cost of phosphates is calculated at 2*d*. per lb. ; and of alkalies at 1½*d*.

f. As to the adulterations to which guano is liable :—As no organic matters can be economically applied as an adulteration, or, at any rate, in such forms as shall escape ordinary observation, the whole adulterations it is necessary for the farmer to guard against are inorganic, or mineral adulterations. The most common are gypsum, chalk, sand, earth, and clay. They can all easily be detected. Gypsum, by presence of sulphuric

acid, indicated by its action on chloride of barium; also by the lime being precipitated by oxalate of ammonia; chalk, by effervescence of the ash with muriatic acid; sand, by insolubility in water and muriatic acid: earth and clay are indicated at once by the coarse red ash peculiar to earth, due to the iron present.

g. As to the crops not benefited by guano, this materially depends on the variety of guano chosen. Peruvian, due to its great per centage of ammonia and nitrates which it furnishes to plants, is highly stimulating, and better calculated for the growth of cereals. The other varieties, as the Bolivian, &c., as they contain a superabundance of phosphatic matters, are better suited for the growth of roots, and in many cases they are employed to the greatest advantage in the place of superphosphates, provided they can be obtained at a reasonable commercial value. So the other rates, as the Saldanha Bay and the Patagonian, which are very rich in lime, are better calculated for those plants—as the leguminosæ, Peas, Beans, &c., which are much more benefited by it than by even a dressing of the highly nitrogenised Peruvian guano.

It is scarcely advisable to use Peruvian guano alone, as by its highly stimulating properties it is apt to decrease the quantity of grain, and thus its action is seen chiefly in the straw. When land is very light and thin, and especially if roots are to be grown, it is far from judicious to apply too heavy a dressing of such a concentrated manure, as its good effects on the one hand are fully counteracted by the less value of the roots produced. Moreover, in the case of leguminous plants, it would act injuriously rather than otherwise.

h. As substitutes for guano we may reckon any of the highly nitrogenised manures, as farm-yard manure, flesh, blood, and animal matters of all descriptions, those rich in gelatine or any of the protein or albuminous matters, which furnish ammonia on decomposition.—I have omitted a very essential point, viz, the occurrence of lumps of urate of ammonia, which are always to be found in good guanos, and from which uric acid is obtained. It is in a great measure due to this salt that guano is so valuable, as uric acid itself contains as much as 34 per cent. of nitrogen. Also, as to lime; in good Peruvian guano you should obtain no precipitate with oxalate of ammonia, as that would show that lime exists in a pure state. Again, it should always give a white ash—indicative of its purity. It should give off much ammonia when quicklime is mixed with it. A good bushel of good Peruvian guano should weigh about 62—64 lbs.; this is an important point.

3. The effect of quicklime on fresh and putrid urine is very different. 1st, Applied to fresh urine, it at once destroys the fermenting agents, entirely preventing the decomposition of the urea existing in it, and thus the urine will keep sweet for some long time; 2nd. Applied, on the contrary, to putrid urine, where the urea is already decomposing, and carbonate of ammonia is given off in great abundance, it assists such decomposition, and the result ultimately is a great loss in a much quicker time. This is also clearly shown in the case of any fermenting organic matter, as guano for example, which is always in a manner decaying, the appliance of a little quicklime rapidly disengages the ammonia. Hence this is of great importance to consider, as while on one hand it is very beneficial to place in a clean tank some considerable amount of quicklime previous to its being filled with urine, so on the other hand the addition of a very small quantity of quicklime to that urine after it has remained in the tank some time, and turned putrid, would be in reality counteracting the very aim and end of its previous application; so spreading lime about stables, if done when the stable is clean, and constantly, has rather a beneficial effect than otherwise.

Home Correspondence.

Crops in Sussex.—Our Wheat, which in June looked in most places very indifferent, slight, and backward, has much improved, and instead of an average of scarcely five sacks, is now likely, with a good harvest, to be above an average—7 sacks—and abundance of straw. Oats have likewise improved, and will be an average, both in straw and grain. Barley good—above an average in both; Grass a fair average where made; hops it is difficult to know anything of; there is a little improvement, possibly the present warm, or rather hot weather, may assist them. Mangold Wurzel and Turnips look well. In respect to Potatoes, the blight is as bad as ever; it commenced six weeks ago in our gardens, which now, in different places, are quite bare. I have begun to cut the haulm off close, and earth them well up, as the tubers are as yet but little affected. We had a severe storm passed over us last night, with heavy rain, and more this morning, and the weather appears very threatening. I earnestly trust we shall have a tolerable harvest, sufficient to feed us with flour, as last year, owing to the bad crop, I have no doubt it cost this populous country parish 5000*l.* or 6000*l.* to find us in food for our consumption, from other sources. *W. Baldock, Rotherfield.*

Hay.—As a good deal of last year's hay is mouldy, and more will be this year, it would be a great boon to many small occupiers if some correspondent would say whether any cheap apparatus is sold for steaming hay, and so purifying it of the mould, or whether such could be easily put up. Or could a wash-house boiler be adapted to the work? In either of these latter cases a description sufficiently full for country workmen should be given. Does steaming consume much coal? Is it possible to steam for two or three days' consumption for four cows and three horses? *Kent.* [It is advisable to steam each day the consumption of that day. Nothing is easier than to direct the steam from a covered boiler into some chamber—a cask, for instance—into which the chaff is placed; and that is all the apparatus needed.]

Mangold Wurzel running to Seed.—I have never, hitherto, been able to obtain a satisfactory reason why Mangold Wurzel is so apt to run to seed prematurely, though I have interrogated many growers on the subject; I think I may safely assert that I have never seen a crop but what was more or less subject to it. This year I think I shall lose half of my crop from this cause. We rarely see a crop of Turnips or Cabbages subject to this complaint; I think it can hardly be attributed either to the time of sowing, or the state of the atmosphere or soil; for if that was the case, it would apply equally to the whole crop. My own opinion is, that it is from the seed being ill-selected; and I fear the growers of it mix the seed of those which have run prematurely with the rest; if this is the case, I think it would account for it, as I can well imagine that roots produced from the seed of those plants which have run would themselves be liable to go to seed. However, if any of your readers could give a satisfactory reason, and, at the same time, suggest a remedy for the evil, they would confer a boon upon the agricultural interest. *A Subscriber.*

The Wheat Crop.—Allow me to suggest that you again call on your various correspondents to furnish you with a further report of the Wheat crop. When I forwarded my statement some three weeks ago, I did so as faithfully as circumstances permitted; and, as regards spring grain, I have reason to believe that I reported correctly, but, I regret to say that my opinion since then, in reference to the Wheat crop, is decidedly changed; indeed, I fear that many, like myself, have been deceived by appearances. I have examined many fields in this district during the last day or two, and scarcely a perfect ear is to be found; in many ears which I pulled, I found from six to 12 kernels either shrivelled or decayed. Should other neighbourhoods be similarly affected, the crop must be decidedly below an average. Harvest will commence here generally about the 21st of this month. *William Cubitt, Bacton Abbey, North Walsham, Norfolk.*

Saving Corn in Damp Weather.—A field of white Oats, near Plymouth, was cut wet, and the weather continuing the same, was at last stacked in layers, with dry straw between. On taking abroad the rick, the grain was found in excellent condition, not sprouted nor damaged in any way. And what answered with so precarious a grain as white Oats, will stand a better chance with Wheat, or even Barley. In this way thousands of acres might have been saved, which have been left to sprout on the ground; and where straw is all used up, other dry stalks, or even shavings, might answer. Where no dry straw, &c., is to be had, it may be dried in sheaf; either by a simple kiln, as in Russia, &c., described in "British Husbandry," vol. ii., p. 206; or without the risk of fire, by lime, as follows:—If the rick be made hollow, with the grain turned inwards, a sufficient quantity of fresh quicklime placed within, and then all closed in from bottom to top, and covered over to exclude the external air, the lime will rapidly dry the air within, which will as rapidly draw moisture from the corn; and so continue until the corn is dry, or the lime fully slaked; and as quicklime will absorb about one-third its weight of water, a ton of lime will take between 6 and 7 cwt. of water, and thus probably dry 6 or 7 tons of corn and straw. For all this water must come from the corn, if the external air is well excluded, and the lime raised from the soil by a bed of stones, gravel, or straw. The lime must not, of course, touch the corn; and therefore room should be left for it to swell in slaking and for turning it over, to slake all through; and a sort of door-way must be left on the side of the rick, which can be opened for putting in the lime, and for turning it over; but must be closed up immediately, and kept close, except at those moments. I am not aware of this lime method having been practised on the large scale; though habitually recommended (by me) in damp seasons. On the small scale the farmer can easily try it for himself, by laying a dozen or two of damp ears upon a large plate, putting about an ounce (more or less) of fresh burnt lime, broken, but not slaked, upon the same, and covering over with a basin that fits the plate pretty close. The lime may be placed on a bit of linen or calico, to prevent its touching the corn as it slakes. Let it stand thus for a week, looking at it once a day, and covering up again quickly. Another like plate of corn, covered up in the same way, but without lime, might stand beside it for comparison. If the damp corn were reaped close to the ears, and dried with lime in this way in a close room, instead of the basin, of course much less lime would do, and the drying would also be much quicker than in stack. *J. Prideaux.*

Covered Yards.—I understand that covered yards have been made of glass in some parts of England. The open space in the centre of a square of farm offices has been covered with strong glass (Hartley's rough plate), which is supported on cast-iron pillars like a railway station. Will you kindly inform me if you know in what part of England it is to be seen, and if it is found to answer the purpose for accommodating cattle and sheep, &c.? One of the Scotch architects here informs me that he will undertake to put up a yard of this description at a less expense and give more accommodation than any other method of enlarging a farmsteading, and afford greater comfort to stock of every description; and also to the people who have the charge of the stock. This may be all quite true; but as I have frequently in making improvements had to incur a large expenditure without reaping a corresponding advantage, I am desirous on that account of seeing and learning from those who have made the experiment whether this plan is worthy of being adopted. Besides it is advantageous to see the system of farming adopted in England at some of the farms where such improvements as above described have been carried out. In going from home one sees many improvements worthy of being put into practice. Mechi has covered yards, but not of the kind I have described. *J. D.* [Perhaps some correspondent will kindly give the information here desired.]

Cattle Grazing.—I suggest the following method of more economically consuming the growing produce of our Grass fields than is at present effected by the indiscriminate pasturing by cattle. The sources of waste at present are two-fold;—1st, the treading down of the Grass while the cattle are feeding; and 2d, the injury done by their droppings, which cover so much land, and render all around them over-luxuriant and distasteful. To obviate both of these evils, I propose to adopt such a plan as, like the system of folding sheep upon Vetches, shall keep the animals confined to the ground which has been fed, allowing them only gradual access to that which remains for consumption. For this purpose I would simply use a rope stretched across the field, fastened at intervals by pegs to the ground. These intervals should be the spaces allowed to the cattle, which should be tethered to the rope, one to each interval, by a running ring, allowing them motion from side to side between the stakes or pegs; the rope should be high enough to hinder the cattle from passing it, and being gradually moved forwards it would have the same use and effect as the hurdles moved forward in the Turnip field or on the Vetches, where the sheep are allowed access to the growing crop only as fast as they are able to consume it. A rank of cattle tethered in this way might commence at one end of the field. A boy ought to attend upon them and shift the pegs forward as fast as was needed. He should also be provided with a wheelbarrow, and gather up the manure in the rear of the advancing rank just as fast as it was produced. This manure should be carried to a tank close by, or at once mixed with water in the barrow itself, and a water cart being in readiness each day's produce of this kind should be spread in the liquid form in the rear of the cattle evenly over the whole of the ground from which it had been produced, and to which it is thus evenly and unwastefully returned. The Grass would spring up evenly instead of in patches, and naturally instead of distastefully and irregularly luxuriant; and the cattle, on reaching the other end of the field in the course of days, would find the beginning of it ready for them, to recommence the process of grazing upon it. I should like to know what objections there may be to my plan. Perhaps the unevenness of quality in the Grass of the field may be one of them. In that case I would empower the attendant boy to widen the intervals between the separating pegs when that may be needed, and diminish them elsewhere according to his judgment. I know that it is possible to graze land very perfectly under the ordinary system. I have seen in Lincolnshire lately fields which I might say were perfectly grazed; but for one of which, owing to the quality of the Grass or the skill of the farmer, this may be said, there are twenty to be seen where a great deal of waste unquestionably occurs. I believe my plan would diminish this waste; and I should like to know what the practical farmer may have to say against it. *C.*

Reviews.

Report of a Discussion at the Wakefield Farmers' Club, May 5, 1854: On the Merits of Chandler's Liquid Manure Drill. Tyas and Horridge, Printers.

The pamphlet thus entitled contains an essay on Turnip Cultivation, by Mr. Kemp, in which the merits of Chandler's manure drill are illustrated and proved. Our readers are aware of the rivalry between this and Spooner's water-drill. It was in consequence of Mr. Spooner's paper on this subject, at the London Farmer's Club, that Mr. Kemp's paper, at Wakefield, was prepared, and as the arguments of the former have been given in some detail (see p. 241), it is only fair that the latter, with the testimonials which he quotes, should find publication now.

The following is the report of an experiment made by Mr. Harding, a tenant of Lord Portman's, living at Durweston, near Shroton Blandford, Dorsetshire:—"One cwt. of soluble superphosphate was allotted to drill 1 acre of Turnips, at 18-inch distances, and though done late in the season, the effect produced was very distinctly marked. From the slight calculations I made at the time, I believe it will be found that the cwt. of superphosphate, if it had been placed in one continuous drill only, would have been distributed over 5½ miles of land (lineal measure), and, from what I saw of it, it was most evenly and perfectly distributed, and very distinctly showed the effects of the manure. I spoke of it then (as I do now) as a proof of the power of Chandler's Liquid Drill in nicely distributing the manure—and I have never seen any other implement that would do so. In fact, when we consider that the cwt. of superphosphate is only about 5 or 6 pecks of solid substance, it is

next to an impossibility that any mechanical contrivance can comminute that quantity and evenly distribute it over such a distance in a dry state. I have been in the habit of using all sorts of manure drills, and have personally paid great attention to the mixing of artificial manures with ashes, &c., and till I got the liquid drill, I invariably found, that in spite of all my care and attention, I could not get it on the land evenly. I find now, that with Chandler's drill, if the manure is genuine, and properly prepared, whether you use 1, 2, or 3 cwt. per acre, or 4, 6, 8, 10, or any other quantity of hogsheads of water per acre, you can, with very common care and oversight, get it laid on evenly—as the liquid seems to be all charged alike—much the same (if I may use the simile) as if you threw a pint of brandy into a quart of water, or a pailful, however small the proportion to each other allowed, still the effect is in that proportion, and acts immediately to the extent that you might reasonably expect."

This is reported by Mr. Ingram, of Shrotron Blandford, and on it Mr. Kemp remarks—"This note, I should remark, was written and in my possession before Mr. Spooner read his paper, and consequently has not been obtained for the sake of contradicting his statement."

Mr. Kemp, speaking of his own experience, adds as follows:—"After five years' experience with this liquid drill, during which time I have tried several different manures, I find that bones, dissolved with sulphuric acid, or superphosphate of lime, is the best and cheapest manure. Two bushels of bones, dissolved with 84 lbs. of acid, and drilled with from 200 to 400 gallons of tank manure, I have found sufficient for an acre of poor land, without any other manure. Two cwt. of superphosphate appears also, when applied with Chandler's drill, to produce a greater weight of meat than other management costing three times as much. As an instance of this, I will read an experiment made by Mr. Biggs, of Stockton House, Wilts. In speaking of the liquid drill, Mr. B. says:—

"Stockton House, January 29, 1849.

"Dear Sir,—I have much satisfaction in stating the benefits resulting from the use of your liquid manure drill;—it is a most valuable machine. I was surprised to see the plants come to the hoe so early. I drilled in 6 acres of Swedes, using three different sorts of manure, of which the following is an exact account.

"No. 1. Two acres, drilled May 22d, with 2 sacks of dry bones, 1 sack of dissolved bones, and 40 bushels of compost, at a cost of 2*l.* 13*s.* 2*d.* per acre; produce, 18 tons 18 cwt. 2 qrs. 8 lbs. per acre.

"No. 2. Two acres, May 29th, with 44 bushels of pigeon manure, at a cost of 2*l.* 4*s.* per acre; produce, 20 tons 15 cwt. 2 qrs. 14 lbs. per acre.

"No. 3. Two acres drilled on the same day as No. 2, with 2 cwt. of super-phosphate and 200 gallons of water, at a cost of 16*s.* per acre; produce, 28 tons 4 cwt. 1 qr. 4 lbs. per acre.

"The whole 6 acres were folded precisely alike, Nos. 2 and 3 had a slight coat of muckle. No. 3 was 12 days earlier to the hoe than either of the other two.

"Seeing the Swedes put in with the liquid manure going so much a-head of the others, I broke up 8 acres of two-year-old lay one earth, drilled-in red and green round Turnips with 2 cwt. of superphosphate and 200 gallons of water per acre, at a cost of 16*s.* per acre, and had a splendid piece of feed—some of the Turnips measuring 20 inches round. So satisfied am I with your liquid manure drill, that I shall put in all my Turnips and Mangold Wurzels with it this season.

"I am, dear Sir, yours truly,

"To Mr. T. Chandler." HARRY BIGGS."

"You will perceive, by this experiment, that Chandler's drill produces 7 tons 9 cwt. more Turnips per acre than the compost drill, and at 1*l.* 8*s.* per acre less cost. No. 1, drilled with bones, by the compost drill, does not produce so much weight per acre by 9 tons 6 cwt., although 1*l.* 17*s.* 2*d.* more per acre is expended. You will also observe that Mr. Biggs says those sown with the liquid drill were 12 days earlier to the hoe than those put in with the compost drill."

In the subsequent discussion, Mr. Simpson, of Thornes, Mr. Johnson, of Chevet, and others, stated their experience in favour of the drill. The latter said:

"He was satisfied with what had been said about the liquid manure drill, and it quite tallied with his own experience of it. The last year, when he had used this liquid manure drill, he used it upon land that was in a clotty state, but independent of this disadvantage, the crop was a good one. The land had been slightly manured before, but not to any amount. It was a capital crop of Turnips. Mr. Ringrose, whom he had called in to ascertain his opinion, said it was the best crop he had seen that year. In consequence of this commendation, he (Mr. Johnson) had got another of the drills, and being desirous of ascertaining the most proper quantity of Simpson's nitrophosphate for producing a good crop, he began by trying 6 cwt. per acre and then reduced it to 3 cwt. per acre; he had quite as good a crop with 3 cwt. as 6 cwt., thus proving that you may give land more manure than the plants can take up. He certainly approved, however, of the liquid manure drill, and intended testing it more fully in his future operations."

There can be no doubt of the value of the drill; the question between the merits of Mr. Spooner's and Mr. Chandler's drills is one simply of degree—and that will be determined only by experience in a variety of seasons.

Miscellaneous.

The Quantity of Seed per Acre is regulated in part by the variety grown, the condition of the soil as regards r chness, natural texture, friableness, altitude, the period of sowing, and the manner in which the seed is deposited, whether drill or broadcast. The usual practice is to allow too much seed. This arises partly from custom and partly from the destruction caused by crows and game. With high condition and freeness of the land from weeds, the improved practice is to allow less seed. In the case of the Turnip, 2 to 4 lbs., varying according to the fineness of the tilth. Wheat after Turnip, if autumn sown, from 10 to 12 pecks; if spring sown, from 12 to 14. Barley from 10 to 12 pecks, if sown in March; 1 or 2 pecks less if sown in April. Oats vary considerably, 8 to 12 pecks on soils in high condition, but the most common quantity is from 12 to 16 pecks. Beans vary from 9 to 13 pecks, the latter being most common. Wheat after Beans from 9 to 13 pecks. Wheat is usually prepared previous to sowing by being steeped in a solution of sulphate of copper, 1 lb. to 2 lbs. being dissolved in water for the quarter of Wheat. *From the Report on the Farming of East Lothian, by Mr. Stevenson in the Eng. Ag. Soc. Journal.*

Calendar of Operations.

JULY.

FORFARSHIRE GLENS, *July* 31.—The weather during the past three months has been generally moist and mild, with a remarkable absence of scorching days and frosty nights, so common in the early part of summer, and the effect has been the production of a more than usually luxuriant vegetation. The corn crops are bulky, but although much earlier sown, are not any nearer maturity than at this date last year. Barley is filling, has a good head, and thick on the ground. Oats are nearly at full length, show a fine ear on a strong clean stalk—clear indications of plenty of porridge meal. We do not expect harvest before the second week of September. Haymaking has been rather ticklish work, but where promptitude and energy have been exercised, it is secured in good condition, the crop is about an average one and the price remunerative. Potatoes are generally healthy and vigorous, and promise a full return; a few fields are to be seen where the stems are small and lanky, evidently the result of a weak seed; probably too much economy has been exercised in cutting: no appearance of disease. Turnips have all along been strong and vigorous, so much so that hoeing and thinning were often far in arrear; the season has been highly favourable to this crop, and present appearances indicate that it will be a full one. Grass has all along been, and still is plentiful, and flocks and herds thriving apace. The clip of wool is very deficient, from 15 to 20 per cent. below average, which it is not easy to account for, seeing the winter was mild, and the sheep in good condition; probably a general shortness of Grass during last summer and autumn may have been the cause; the price has also gone back 25 per cent., the highest realised at the Erechin fair for black-faced wool was 7½*d.* per lb. The greater part of the clip has been disposed of, but with this double drawback a comparatively small sum will be realised for the produce. A fair crop of lambs has been weaned, and as far as sold a deduction in price has been submitted to. On the Moors the grouse are numerous and strong, and sportsmen will require to ply well their vocation after the "twelfth," and keep them within proper limits, else they will be both troublesome and expensive to the tenants at the end of harvest. The "Calendar of Operations" at present is light, and opportunity is afforded of repairing the engine, and raising the steam for the labours of the coming autumn and winter. *S.*

WEST SUSSEX, *August* 15.—We have now got into the middle of harvest, and the weather for that purpose is all that we can desire. Wheat is nearly all cut; and as it has been well hardened before cutting, it will soon be carried. We fear there is not such an abundant crop as we expected. Within the last ten days it has become much blackened in the ear—not all through the field, but in large patches here and there, being worst in that which had been latest in ripening. Some, since being cut, has become discoloured outside the sheaf, while standing in the shock; and those ears that are so affected are thinner than the others. But, for all this, we must not say that the crop promises badly; but only that it is not quite so good as we thought it would be. Barley is rather backward, but is coming on fast, and the ears look large and healthy. Peas have been got together in good order, and are a good sample, better than they appear to have been for some years; they are always regarded as a very doubtful crop. Beans will not be fit to cut for a week or ten days. Cattle food is now getting very short, and the effect will no doubt be to bring down the price of lean stock, which has long been so high, especially as the late Turnips are not likely to progress much with the long-continued dry weather we have had. But the early sown do pretty well; there is still a practice of sowing later than need be done. Potatoes here still look well, and the quality is better than it has been for several years. *G. S.*

Notices to Correspondents.

CHEVIOTS: *A Young Farmer.* Stagshaw fair, near Hexham, Northumberland, is a large fair for sheep; it is held July 4th; Brough Hill, Westmorland, Sept. 30th, is your most likely place now. We have hardly any information of fairs in Yorkshire, as regards sheep.

DIPPING APPARATUS: *X.* A good arrangement for the purpose was exhibited by Mr. Rome, of Langholm, at Berwick and Armagh—of which, however, the judges gave no opinion, owing, we believe, to its non-arrival in time.

FARMS: *A Suffolk Reader, Inquirer, and Spes.* We hope to clear off arrears next week.

PARK-PALINGS: *G H.* will be obliged for information on the most economical mixture to put on park-palings, which are made of Larch. Anything that would show the colour of the wood would be best.

POULTRY: *S D.* Give your chickens the most nourishing food you can procure, and to remove their tormenters, apply a little spirits of turpentine and water, or a strong effusion of tobacco. *W. S.*

SEED: *G T., Guernsey.* We cannot direct you to seed *growers.* Many farmers grow some small portion of Swedes, Mangold Wurzel, and Carrots for seed, and we might direct you to where you could obtain any of these seeds from the grower; but we don't know any one who takes up "seed" growing as the main produce of his farming. "The earliest Vetch in cultivation" is grown near Blandford in Dorsetshire. Messrs. Sutton, of Reading, have seed of it. We shall feel much obliged for information on your methods of cropping and rotation.

SOIL AND AGRICULTURE OF TURKEY: *A B.* We are unable to direct you, except to Loudon's "Cyclopædia of Agriculture," pp. 120, 122, where you will find reference to his authorities.

VETERINARY PRACTICE: *O S.* We have sent your inquiry where it will receive a trustworthy answer.

WHEAT: *W C M.* We would not attempt to grow Wheat on a fresh grubbed Hop garden. It would most likely be laid, mildewed, and spoiled. If forced to it we should apply a dressing of salt, about 1 cwt. each time, during wet weather in November, March, and April.—*General Arbuthnot.* Your ears of Bristol Red are the most magnificent specimens we have seen; and if the sample is anything near the average, the crop must be enormous.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

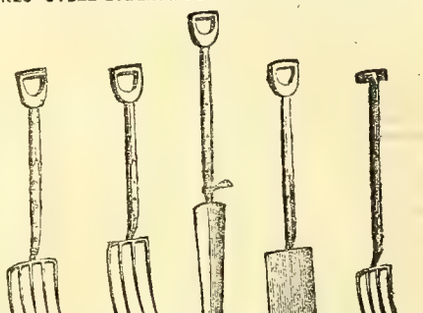
CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS AND KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—BURGESS & KEY'S Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.
103, Newgate Street, and 52, Little Britain, London.

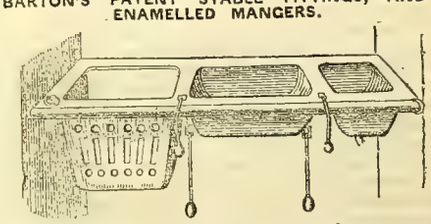
CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.
103, Newgate Street, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

BARTON'S PATENT STABLE FITTINGS, AND ENAMELLED MANGERS.



THESE FITTINGS have all the newest improvements and are the only patented invention of this description. Also Improved Stable Fittings with Rack, Manger, and Water Trough attached, New Pattern Manger and Water Trough combined; Corner and Straight Mangers, Plain, Enamelled, and Galvanised; Stable Furniture of every description, Iron Gates, Railing, Hurdles, Sheep and Game Wire Netting, Registered Poultry Troughs, Fountains, Feeders, &c.—JAMES BARTON, IRONFOUNDER, SMITH, &c., 370, Oxford Street, a few doors east of the Pantheon.

IMPORTANT TO

FLOCK MASTERS.

SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

THE ADVANCE OF SCIENCE IN AGRICULTURE.

RICHMOND AND CHANDLER'S unprecedented celebrity for their improved CHAFF MACHINES and CORN CRUSHERS, achievable only by intrinsic merit, has secured for them the highest character in the trade, together with the confidence of the public, whether as regards true economy or the unapproachable finish and sterling quality which characterise all their productions, and render them worthy the reputation of a Manchester manufacturer.

The most distinguished authorities in all civilised countries report their unqualified satisfaction with the highly-beneficial effects resulting from the use of these justly celebrated Machines, and with the now established fact of their not being subject to any of the contingencies inseparable from other machines, they are calculated to meet with general approval in the present advancing state of agriculture.

Address—RICHMOND & CHANDLER, Salford and Manchester; and 32, South John Street, Liverpool.

REAPING AND MOWING MACHINES.—CAUTION.—Notice is hereby given, that any person or persons infringing any of the Patents of Cyrus Hall M'Cormick, for Reaping and Mowing Machines, or making, or vending, or using, or exercising any Machines which in any way infringe upon any such Patents, will be proceeded against according to law. The more prominent features of M'Cormick's Patents consist in a serrated cutting blade, spear-head shaped holding fingers, and a gathering reel.

E. J. & H. LAWFORD, Mr. M'Cormick's Solicitors.
Draper's Hall, 27, Throgmorton Street, London, Aug. 19.

WEIR'S IRRIGATORS, LIQUID MANURE PUMPS, FIRE AND GARDEN ENGINES.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London, removed from Oxford Street.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£ s. d.
Patent Pump	1 15 0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3 0 0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

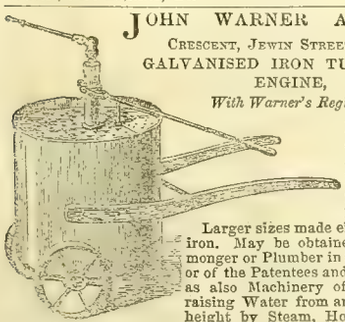
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

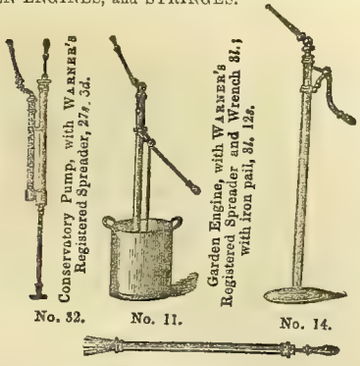
JOHN WARNER AND SONS,
CRESCENT, JEWIN STREET, LONDON.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with Warner's Registered Spreader, 27s. 3d.
Garden Engine, with Warner's Registered Spreader and Wrench 31.; with iron pail, 3l. 12s.
Patent Conservatory Pump, with Warner's Registered Spreader, 2l. 13s.; with iron pail, 3l. 5s.
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

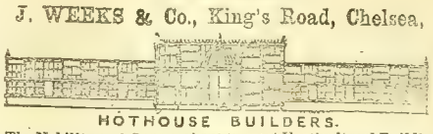
No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

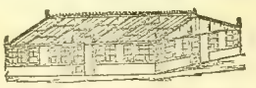
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

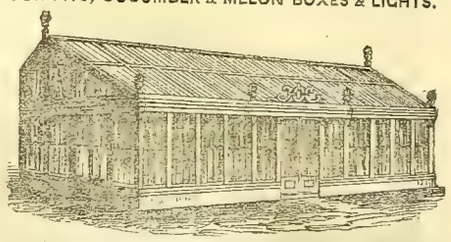
PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

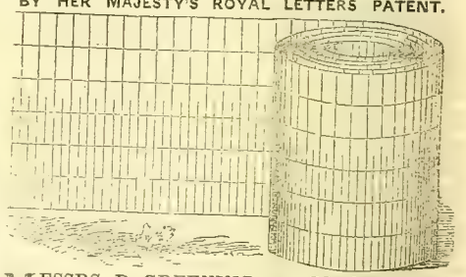


JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

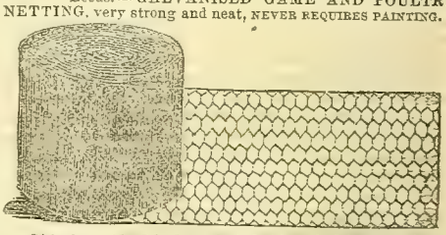
BY HER MAJESTY'S ROYAL LETTERS PATENT.



MESSRS. B. GREENING AND CO. beg respectfully to call attention to their superior WIRE FENCES, of which the following are the principal varieties:—Portable Horse and Cattle Fencing (Economical variety of ditto), Portable Sheep and Lamb, Proof Fencing, Poultry Fence, Portable Hare and Rabbit-proof Fencing, Ornamental Garden Fences, Export varieties, Poultry and Chicken-proof Fencing. Light and cheap kinds of most of the above. Trainers for Peas, &c., Garden Bordering, Tree Protectors, Hen Houses, Poultry and other Aviaries, &c.

Messrs. B. G. & Co. being the sole patentees for the machinery for manufacturing these Fences, will forward engraved sheets of Patterns, Prize Lists, Prospectuses, &c., gratis, on application to their establishments, 1 and 3, Church Gates, or 2 and 2 A, Cateaton Street, Manchester.

J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8¾*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	1 "	11 "

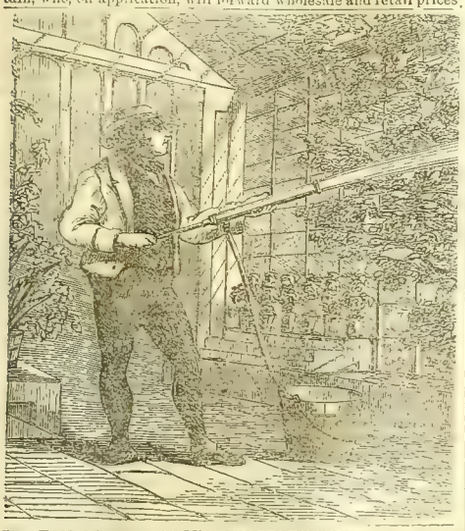
All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

HOSE PIPING.—GREAT REDUCTION IN PRICE.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 30 per cent., which advantage is offered to the public.

BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, 21s. each; Large size, for Gardeners' use, 25s. each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow.

THE COMFORT OF A FIXED WATER CLOSET for 1l.—Places in gardens converted into comfortable water closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Indispensable for the health and comfort of a family. Hermetically sealed Inodorous Chamber Commodes, 1l. 4s., 2l. 6s., and 3l.; also, Improved Portable Water Closets, with pump, cistern, and self-acting valve. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE and Co.'s, removed to more commodious premises, at 46, Leicester Square, London.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery; at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

NO MORE PILLS OR ANY OTHER MEDICINE.

DU BARRY'S DELICIOUS REVALENTA ARABICA FOOD is the natural remedy, which has obtained 50,000 testimonials of cures from the Rt. Hon. Lord Stuart de Decies, Archdeacon Stuart of Ross, and other parties, of indigestion (dyspepsia), constipation, and diarrhœa, nervousness, biliousness, liver complaint, flatulency, distension, palpitation of the heart, nervous headache, deafness, noises in the head and ears, excruciating pains in almost every part of the body, chronic inflammation and ulceration of the stomach, irritation of the kidneys and bladder, strictures, erysipelas, eruptions of the skin, impurities and poverty of the blood, scrofula, incipient consumption, dropsy, rheumatism, gout, heartburn, nausea and sickness during pregnancy, after eating, or at sea, low spirits, spasms, cramps, epileptic fits, spleen, general debility, asthma, coughs, inquietude, sleeplessness, involuntary blushing, paralysis, tremors, dislike to society, unfitness for study, loss of memory, delusions, vertigo, blood to the head, exhaustion, melancholy, groundless fear, indecision, wretchedness, thoughts of self destruction, and many other complaints. It is, moreover, the best food for infants and invalids generally, as it never turns acid on the weakest stomach, but imparts a healthy relish for lunch and dinner, and restores the faculties of digestion and nervous and muscular energy to the most enfeebled.—Barry Du Barry & Co., 77, Regent Street, London. A few out of 50,000 cures are here given:—Cure No. 71, of dyspepsia, from the Right Hon. the Lord Stuart de Decies: "I have derived considerable benefit from Du Barry's Revalenta Arabica Food, and consider it due to yourselves and the public to authorise the publication of these lines. Stuart de Decies." Cure No. 49,832:—"Fifty years' indescribable agony from dyspepsia, nervousness, asthma, cough, constipation, flatulency, spasms, sickness at the stomach, and vomiting, have been removed by Du Barry's excellent Food.—Maria Jolly, Wortham Ling, near Diss, Norfolk." Cure No. 47,121:—"Miss Elizabeth Jacobs, of Nazing Vicarage, Waltham Cross, Herts: a cure of extreme nervousness, indigestion, gatherings, low spirits, and nervous fancies." Cure No. 48,214:—"Miss Elizabeth Yeoman, Gateacre, near Liverpool: a cure of 10 years' dyspepsia and all the horrors of nervous irritability." Dr. Wurzer's Testimonial:—"Bonn, 19th July, 1852. This light and pleasant Farina is one of the most excellent, nourishing, and restorative remedies, and supersedes, in many cases, all kinds of medicines. It is particularly useful in confined habit of body, and also in diarrhœa, bowel complaints, affections of the kidneys and bladder, such as stone or gravel; inflammatory irritation and cramp of the urethra, cramp of the kidneys and bladder, strictures, and hæmorrhoids. This really invaluable remedy is employed with the most satisfactory result, not only in bronchial and pulmonary complaints, where irritation and pain are to be removed, but also in pulmonary and bronchial consumption, in which it effectually counteracts the troublesome cough; and I am enabled with perfect truth to express the conviction that Du Barry's Revalenta Arabica is adapted to the cure of incipient hectic complaints and consumption.—Dr. Rud Wurzer, Counsel of Medicine, and Practical M. D. in Bonn." —In canisters with full instructions—1 lb., 2s. 9d.; 2 lbs., 4s. 6d.; 5 lbs., 11s.; 12 lbs., 22s.; super-refined, 5 lbs., 22s.; 10 lbs., 33s. The 10 lbs. and 12 lbs. carriage free.—Barry Du Barry and Co., 77, Regent Street, London; Fortnum, Mason, and Co., 182, Piccadilly; also at 4, Cheapside; 60, Gracechurch Street; 49, Bishopsgate Street Within; 330 and 451, Strand; 63, Oxford Street; 5, Eccleston Street, Pimlico.

HOLLOWAY'S PILLS AN ASTONISHING REMEDY FOR THE CURE OF ASTHMA.—Mrs. Newton, of Hyde states in a letter to Mr. Wild, Chemist, Hyde, that for many years she had been afflicted with severe attacks of Asthma, great difficulty of breathing, a violent cough and acute pain in the side; she tried various remedies, and was under the treatment of several surgeons for months together, without obtaining any benefit; at length she was induced to try Holloway's Pills—the first dose gave relief, and by continuing them a cure has been effected. Being anxious that others so afflicted should obtain relief, she desires this fact to be publicly known.—Sold by all vendors of medicine and at Professor Holloway's Establishment, 244, Strand, London.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1s. 1½d. and 2s. 9d. per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp

THE English public have, by the test of experience, become satisfied that PARR'S LIFE PILLS are composed of simple but powerfully curative ingredients. They are so mild and so excellent that a child may take them. PARR'S LIFE PILLS will be found speedily to reanimate the spirits, improve the digestive powers, and restore the whole nervous system to a happy and natural state; the balsamic powers of this medicine produce that delightful feeling of good spirits so very desirable, and dispose both mind and body to healthy exercise—everything under its influence soon wears a joyous aspect, and the varied duties of life are performed with pleasure. For Liver Complaints, Bilious Disorders, Indigestion, Costiveness, Pains in the Back, Gravel, Lumbago, Sick Headache, Loss of Appetite, and Depression of Spirits, PARR'S LIFE PILLS will be found a safe and admirable remedy. Ask for PARR'S LIFE PILLS, sold by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, Farringdon Street; Sutton & Co., Bow Churchyard; Hannay & Co., and Sangar, Oxford Street, London; and by all respectable chemists and medicine vendors in town and country. In boxes, price 1s. 1½d., 2s. 9d., and in family packets, 11s. each.

FARMS.

TO BE LET, with immediate possession, near Havant, in Hampshire, a tithe-free FARM, 456 acres. About one-third is Underwood, about 40 acres Pasture, remainder Arable. A respectable Residence. Farm Buildings in good repair; five Labourers' Cottages. Rent 300 guineas.

In Surrey, between Dorking and Horsham, 235 acres. About one-third Underwood, about 36 acres Meadow, and remainder Arable. With a comfortable Family Residence, with a Lodge entrance, and two Labourers' Cottages. Rent, including sporting, 155 guineas.—Nearly adjoining, 226 acres; of which about 10 acres are Underwood, 30 acres Meadow, and remainder Arable. There are two Farm Homesteads. Rent 100 guineas.

Berkshire, near Reading, on the Basingstoke Road; 146 acres. About 15 acres Meadow, and remainder Arable. A good Family Residence, suitable Outbuildings, and three Cottages. Rent 140 guineas.—To treat and view, apply to Mr. W. SOUNDY, Pack Farm, Henley-on-Thames.

TO BE SOLD, OR LET FOR A TERM, an Eight-roomed COTTAGE, with Stable, &c., and a good supply of water, having two Orchards about 3¼ acres attached. The land is of excellent quality, and freehold, situated at Henbury, four miles from Bristol.—For particulars, address ISAAC JONES, Henbury.

TO BE SOLD, FIRST CLASS BULLS.—HEREFORDS.—"VENISON,"—bred by Mr. STEDMAN: the pedigree will be given in full to a purchaser.

"TRIUMPH,"—1 year and 10 months; sire, Venison; dam, Miss Truman; sire of dam, "The Duke," (493)—bred by Mr. GOUGH.

"CARLISLE,"—1 year and 10 months; sire, Venison; dam, Clara; sire of dam, "The Duke," (493).

SHORTHORN.—"JACK TAR," (11,603)—3 years and 6 months—bred by Mr. BEASLEY, Overstone. By Lord Warden, (7167); dam, Joan, by Lycurgus, (7180); g. d., Joan of Arc, by Javelin, (4093); g.g. d., Jocunda, by M'Ivor, (2237); g.g.g. d., Jacqueline, by Northern Light, &c. &c.

N.B.—For further particulars and price apply to Mr. MOORE, Coleshill, Highworth.

CORN DEALER'S BUSINESS.

TO BE SOLD, an old established Corn Dealer's Business, in the most preferable part of the West End of London, having a large connexion among the Nobility and Gentry, for which a premium of 350l. will be required, and the stock and fixtures to be taken at a valuation. For further particulars address to A. B., Mr. Millizan's office, Hungerford Wharf, Strand, or apply at Messrs. Mansell and Elliott's offices, 13 A, Belgrave Square, and 12, Birchin Lane, Cornhill.

TO BE SOLD, by a Gentleman, GUTTA PERCHA HOSE, of 1¼ inch diameter, and 210 feet long. It cost him, new, 8l. 15s. or 10d. per foot, and he will take 6l. for it. He has not used it more than six times, so that it may be considered as good as new.—Enquire of Mr. CHARLES WALTER, 18, Temple Street, Fleet Street.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

SILVER PHEASANTS.—A few pairs of these beautiful and valuable Birds to dispose of, in exchange for Gold Pheasants, or at a moderate price.—For particulars, apply to CHARLES ADAMS, Temple House, Maidenhead, Berks.

NURSERIES, CLAPHAM.

MESSRS. PROTHEROE & MORRIS are instructed by the Administrators of the late Jos. Fairbairn, to offer for unreserved sale, in the early part of September, the entire stock of specimen Greenhouse and Stove Plants, which are all of the most choice sorts, and in the best condition. The lease of the old established Seed Shop and Nursery to be sold; the Stock may be taken by valuation or by agreement: for particulars apply to the administrators, at the Nursery, Clapham, or to Mr JAMES FAIRBAIRN.

MR. W. T. ATWOOD will sell by Auction, in September next (due notice of which will be given), the unexpired term of Lease of a valuable FRUIT and GARDEN GROUND, in the highest state of cultivation, situate adjoining the high road from Hammersmith to Brentford.—Particulars may be had till day of sale by application to Mr. ATWOOD, Land Agent, Mortlake, Surrey: or Mr. PLOWMAN, 2, Upper Wellington Street, Covent Garden.

ON MARRIAGE.

Just published (to be had free, by enclosing 1*s.* or Twelve Postage Stamps, to Mr. WATSON, Clerical Agent, Robert Street, Adelphi, London).

MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF MILDEW UPON VINES, BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, AND STOVE AND GREENHOUSE PLANTS.—Extra strong, 4*s.* per gallon, sufficient to make four (jars and barrels extra); in bottles, 1*s.* 3*d.* and 2*s.* 6*d.* each. Directions for application forwarded. Ten gallons and upwards carriage free to London.

For testimonials, see whole page of *Gardeners' Chronicle*, March 11, 1854, describing the SATISFACTORY RESULTS derived from its use in cases of Vine Mildew, Thrip, Scale, Green Fly, Red Spider, Mealy Bug, &c., not only without injuring the most delicate flowers or foliage, but promotes a vigorous growth.

From Andrew Toward, Esq., Royal Gardens, Osborne Palace.

"I have great pleasure to add my testimony to the efficacy of your Blight Composition, which has been used with great success upon Rose Trees much affected with the Green Fly."

From Frederick Malleson, Esq., Royal Gardens, Claremont.

"I find it answer the purpose in all respects for Walls, also the Green Fly and Brown Scale in the Houses.—May 9, 1854."

Finest Grasses for Lawns and Parks, and every variety of Garden and Farm Seeds, at B. PAGE & Co.'s, Seed Merchants, Oxford Street, Southampton (20 yards from the Railway and Docks).

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.

It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

ROYAL PANOPTICON OF SCIENCE AND ART, LEICESTER SQUARE.—CHEMISTRY, by Mr. G. F. Ansell, Monday, 2; Tuesday, 3.15; Thursday, 2; Friday, 3.15. FRICTIONAL ELECTRICITY, Monday, 3.15; Saturday, 2. SHOOTING STARS, explained by Mr. W. R. Birt, Tuesday, 7.45. NATURAL MAGIC, by Mr. Malcolm, Monday, 7.30; Voltaic Electricity, Tuesday, 2; Friday 2. Mechanics, by Mr. C. F. Partington, Thursday, 3.15; Saturday, 3.15. Songs and Sayings of Samuel Lover, by Mr. E. L. Hime, Tuesday, 3.15; Friday, 7.30. Isothermal Lines, by Mr. Hugo Reid, Wednesday, 2. Explanation of Machinery and Manufactures, daily at 1 and 7.15. Messrs. Heinke's Improved Diving Apparatus in the Crystal Cistern, 2.45 and 7.30, Tuesday and Thursday, 8.45. Distins' Flügel Horn Union, at 9; Fountain at High Pressure, 4.45 and 9.25; Performances on the Grand Organ, by Mr. W. T. Best, at intervals; and at 8.15, Dioramic Miscellany, including Views of Verona, the Prismatic Disc, and brilliant Chromatropic Effects. Hours of Exhibition—Morning, 12 to 5; Evening, 7 to 10, Saturday evening excepted. Admission, 1*s.*; Schools, and children under 10, half price.

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "THOMAS PROUT" is on the Government stamp.

DR. DE JONGH'S

LIGHT BROWN COD-LIVER OIL, PREPARED FOR MEDICINAL USE IN THE LOFFODEN ISLES, NORWAY, AND PUT TO THE TEST OF CHEMICAL ANALYSIS, THE MOST EFFECTUAL REMEDY FOR CONSUMPTION, BRONCHITIS, ASTHMA, GOUT, CHRONIC RHEUMATISM, AND ALL SCROFULOUS DISEASES.

Approved of and recommended by the most distinguished Scientific Chemists, prescribed by the most eminent Medical Men, and supplied to the leading Hospitals of Europe.

EXTRACTS FROM MEDICAL AND SCIENTIFIC TESTIMONIALS:

THE LANCET, *July* 29, 1854.

"In the preference of the light brown over the pale oil we fully concur. We have carefully tested a specimen of the light brown Cod-liver Oil prepared for medical use under the direction of Dr. de Jongh, and obtained from the wholesale agents, Messrs. ANSAR, HARFORD, & Co., 77, Strand. We find it to be genuine and rich in iodine and the elements of bile."

"THE MEDICAL CIRCULAR." May 10, 1854.

"The pale oil, even when genuine, is deficient to a considerable extent, if not wholly, of the volatile fatty acid, iodine phosphate of chalk, the cholinic acid, bilifellinic acid, and other elements of bile, which are found in their normal proportions in the light brown oil. The utmost reliance may be placed upon the experimental researches of Dr. de Jongh, who is one of the most eminent of European chemists; the oil prepared by him enjoys also the additional sanction of the opinion of Baron Liebig and the late Dr. Pereira, in favour of its genuineness and efficacy. Our own experience practically confirms their judgment, and we unhesitatingly recommend the light brown oil as the best for medicinal purposes, and well deserving the confidence of the profession."

BARON LIEBIG.

"You have rendered an essential service to science by your researches, and your efforts to provide sufferers with this medicine, in its purest and most genuine state, must ensure you the gratitude of every one who stands in need of its use."

DR. JONATHAN PEREIRA.

"I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, whom I regard as the highest authority on the subject. The oil which you gave me was of the very finest quality, whether considered with reference to its colour, flavour, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Sold wholesale and retail, in bottles, labelled with Dr. de Jongh's stamp and signature, by

ANSAR, HARFORD, AND CO., 77, STRAND, LONDON, Sole Consignees and Agents for the United Kingdom and the British Possessions; at the following prices:—

IMPERIAL MEASURE, half pints, 2*s.* 6*d.*; pints, 4*s.* 9*d.*

*** Four half-pint bottles forwarded, CARRIAGE PAID, to any part of England, on receipt of a remittance of Ten Shillings.

New Tale by the Author of "MARY BARTON," to be published weekly in HOUSEHOLD WORDS.

On Wednesday, 30th of August,

Will be published in HOUSEHOLD WORDS, the FIRST PORTION of a NEW WORK OF FICTION, called

NORTH AND SOUTH.

Albion Nursery, Stoke Newington, London.—August 26.

CHOICE FLOWER SEEDS FOR PRESENT SOWING.

PANSY, saved from 100 of the best vars., by name,	2*s.* 6*d.* per pkt.
POLYANTHUS, do. 50 do. ,,	2*s.* 6*d.* ,,
GLOXINIA, from 24 fine varieties, ,,	2*s.* 6*d.* ,,
CALCEOLARIA, from superb spotted prize vars., by name	2*s.* 6*d.* ,,
DAISY, do. 50 of the new Belgian do.	1*s.* 6*d.* ,,
ANTIRRHINUM, do. 20 best named varieties ...	1*s.* 0*d.* ,,
ANEMONE, from the most showy and brilliant kinds,	1*s.* ,,

30 packets of Choice Flower Seeds per post free for 5*s.*

The above, per post, free—Postage Stamps received in payment.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

THE PAST WINTER AND SPRING have induced YOUELL & Co. to publish a CATALOGUE of RARE and HARDY CONIFERS and HARDY ORNAMENTAL SHRUBS, that have proved with them perfectly hardy in this well-known bleak district, exposed to the cutting winds from the North Sea.

This Catalogue also contains an extensive selection of the most useful Greenhouse Plants, Camellias, Ericas, Epacris, Chrysanthemums, Hollyhocks, Tree Carnations, Carnations, and Picotees, Fuchsias, Verbenas, Phloxes, &c., which will be forwarded (stamped) on receipt of two postage stamps,

YOUELL AND CO., Royal Nursery, Great Yarmouth.

LILIUM LANCIFOLIUM, TRITONIA AUREA, AND VALLOTA PURPUREA.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to say that his extensive collection of the above BEAUTIFUL PLANTS is now in flower, and may be viewed every day (Sundays excepted). Admittance gratis.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE begs to announce that a small quantity is still on hand of his superior seed of the above. For description see *Gardeners' Chronicle*, July 29 and August 5. Packets 2*s.* 6*d.* each, payable in postage stamps.

Streatham Place Nursery, Brixton Hill, near London.

LOCKSBROOK NURSERY.

R. SHACKELL has strong plants of his Russian Superb Violet, now in excellent order for potting, at 4*s.* per dozen. Double Purple Perpetual Tree Violet, at 3*s.* per doz. Neapolitan Violet, at 3*s.* per dozen. Other varieties at low prices; hamper included, if the order be above 5*s.* It is requisite to pot the Violet early to insure a good display of bloom through the winter months.

ROBERT SHACKELL, Florist, Locksbrook Nursery, Bath.

RHODODENDRON JAVANICUM.

A. VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to offer good Seeds of the above, just gathered, at 7*s.* 6*d.* and 15*s.* per packet, containing about 2000 and 4000 Seeds.

A. V. G.'s stock of CAMELLIAS and INDICA AZALEA is well set with bloom, at very moderate prices.

A reference from unknown correspondents. Catalogues may be obtained from his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Tower Street, London.

STRAWBERRIES.

J. HARGREAVES is now sending out Strong Plants of the four new Strawberries, viz., Ajax, Ruby, Captain Cook, and Fillbasket, at 10*s.* per hundred, or 25 each of any two sorts for 6*s.*, package included; also, all the old sorts at 3*s.* per hundred.—Address, JOHN HARGREAVES, High Street Nursery, Lancaster.

STRAWBERRY PLANTS.

CHARLES KIMBERLEY has a large stock of the following to offer at 3*s.* 6*d.* per 100:—Keens' Seedling, British Queen, Hooper's Seedling, Elton Pine, Princess Alice Maude, Stirling Castle Pine, and Comte de Paris.

Stoke Nursery, near Coventry.

STRAWBERRIES.

BARRATT'S MAGNUM BONUM.—In size, this splendid Strawberry very far surpasses the "British Queen," is an exceedingly heavy cropper, and continues in perfection later than almost any other variety. Its flavour is really delicious, most nearly approaching the true Pine Apple of any kind yet known. Price per 100, 2*l.* 2*s.*; per dozen, 6*s.* Good strong Plants of the above are now ready for sending out by

St. John's Nursery, Wakefield. WM. BARRATT.

N.B. W. B.'s List of 40 kinds of Strawberries may be had gratis.

STRAWBERRIES, 3*s.* per 100.—Strong well-rooted runners are now ready. British Queen, Eleanor, Prolific, Kitley's Goliah, Cuthill's Black Prince, Princess Alice Maude Myatt's Hautbois, Rivers' Eliza, &c.

BASS AND BROWN, Sudbury, Suffolk.

MAY'S PARAGON CABBAGE.—Fine strong plants of the above can be had at 5*s.* per 1000, on receipt of Post-office order for the amount by applying to

HENRY MAY, The Hope Nurseries, near Bedale, Yorkshire.

CHRYSANTHEMUMS.—Fine bushy plants of the above, both large and small varieties, for flowering this autumn, may be had at CHANDLER AND SON'S, Nursery, Wandsworth Road, from 9*s.* to 12*s.* per dozen.

WELLINGTONIA GIGANTEA.

MESSRS. VEITCH AND SON beg to inform the Public that they have only a limited number of their FIRST LOT OF SEEDLINGS of the above splendid HARDY EVERGREEN TREE left on sale. They would therefore recommend those parties requiring STRONG PLANTS to make EARLY application. Terms AS IN FORMER advertisements.

Messrs. V. & SON beg at the same time to intimate to THE TRADE that they have a second raising of nice healthy young plants in small pots, which they can offer to them on terms varying with the quantity taken, and particulars of which can be had on application.

Nurseries, Exeter and Chelsea, Aug. 26, 1854.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Pine-apple Place, Edgeware Road, London.

MESSRS. J. WEEKS' NURSERY, KING'S ROAD, CHELSEA.—A great alteration is being effected at this Establishment, where the various Horticultural buildings spread over nearly an acre of ground, and extending together to about 770 feet in length, covering an area of 20,000 feet, have hitherto been heated by seven boilers. These boilers worked efficiently and economically, but as great practice in every art leads to improvement, so in this case have the MESSRS. WEEKS found it desirable to replace these seven boilers by one. This one will heat every house and pit efficiently, either altogether or separately, according to pleasure. This alteration will effect a very important saving annually, as the one boiler will not consume more than two out of the seven boilers superseded, whilst the time and labour hitherto expended over the seven, will in future be confined to one. The necessary alterations for this important arrangement are now in progress, and will be completed within a fortnight, and the Nobility and Gentry interested in the principle of heating by Hot Water can here see it practically carried out, and have it thoroughly explained in all its details.

THE BEST PLANT OF THE SEASON.

"BEGONIA PRESTONIENSIS SUPERBA."

W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr. Frost, Gardener to E. L. Betts, Esq., Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with stamens and petals, resembling a double blossom with a golden tinge, exhibiting a charming contrast. The flowers are delightfully fragrant as a Tea-scented Rose. Habit—dwarf and bushy; the flowers are thrown well above the foliage, in large trusses, and altogether one of the best plants yet offered. It received the highest award in June, at the Royal Botanic Show, Regent's Park, as a new plant; also at Maidstone and Ashford. Plants in October, 10*s.* 6*d.* each; one given where three or more are taken.—Bower Nurseries, Maidstone, Aug. 26.

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy. RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, August 26.

"SIR HARRY."—The eminent success of this new SEEDLING STRAWBERRY, at the only Floral and Horticultural Exhibitions where it has been shown, viz., Chiswick, first-class Certificate; 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize—induces the proprietor (hitherto an amateur grower only) to offer it for sale.

The characteristics of the plant are these:—Ripening as early as Keens' Seedling, but continuing fruiting a much longer time—a great cropper, bearing a very large handsome dark crimson berry, which carries that superb colour not only quite through, but to its very end, whilst, being both firm and juicy, it separates itself entirely from its calyx, without having a tasteless core. The delicious and luscious flavour of the fruit, united with its high perfume, throws utterly into shade the Keen and British Queen. The leaves are few, and the vigorous extension of its bearing branches exposes the fruit to the ripening influence of the sun, the want of which exposure is a great cause of failure in many sorts of this class of plant.

An oil-painting of a one-year-old runner, with its gigantic fruit in the respective stages of growth (as sketched from nature), is now to be seen in the Birmingham Exhibition of the Society of Artists; and coloured Lithographs have been taken from it by an eminent London Artist, which may be had on application, price 2*s.* 6*d.* each, in postage stamps.

The Plants will be ready for sending out (not less than a score) on the 20th September next. Prices—100 plants, 6*l.*; 80 plants, 5*l.* 10*s.*; 60 plants, 4*l.* 4*s.*; 40 plants, 2*l.* 17*s*; 20 plants, 1*l.* 10*s.* for a score. A few plants in pots may be had. Apply to MR. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham; each application to be accompanied with a Post-office order (on Birmingham) or cash, to receive attention.—August 1854.

WARD'S "OMER PACHA" STRAWBERRY.

W. J. WARD (by permission of his employer, W. Stephens, Esq.,) offers to his friends and the public the above Seedling Strawberry, which has been proved to possess superior excellence. It is a large handsome fruit, intermediate between the old Carolina Pine and British Queen, partaking of the fine colour of the former, and by many considered superior in flavour to the latter; it is also remarkable for the fine buttery quality of its flesh. Great bearer; ripe as early as Keens' Seedling, affording a long succession of fine fruit. It was exhibited at the Royal Botanic Gardens, Regent's Park, on Wednesday, the 5th of July, and obtained the Bronze Medal. It has also been submitted to Mr. Marnock, Regent's Park, London; Mr. Thompson, Horticultural Society, Chiswick; and Mr. Spencer, Bowood, all of whom speak highly favourably of it. Also the following, who have pronounced it first-rate, and are open to take orders for it:—Messrs. Henderson, Pine-apple Place, London; Mr. C. Turner, Royal Nursery, Slough; Messrs. Standish and Noble, Bagshot; Mr. P. Lydiard, Fruiterer, Bath-easton, Bath; Mr. W. J. Epps, Bower Nursery, Maidstone; Messrs. Sutton, Reading; Mr. W. Barnes, Camberwell; Mr. Lewis Solomon, Fruiterer, Covent Garden.

Strong well rooted plants last week in August. Terms, cash or reference.—100 plants, 3*l.*; 50 plants, 1*l.* 15*s.*; 25 ditto, 1*l.*

A few strong plants in 32-sized pots, 15*s.* per dozen.

Prospect Hill, Reading, August 26.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out new seed of this year's saving, which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each; also a few packets of choice Cineraria Seed at 1*s* 6*d.* 2*s.* 6*d.* each; and 2*s.* 6*d.* each. Primula sinensis, all saved from fringed flowers, and 2*s.* 6*d.* each. A remittance or reference to accompany all 1*s.* per packet. orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.—Aug. 26.

THE

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

CHRYSANTHEMUMS, LILIPUTIAN AND LARGE FLOWERING.—Large and remarkably fine Plants of all the best Sorts, in 32-sized pots, fit to make really good Specimens at once, at 18*s.* per dozen; smaller Plants, in 48s, to flower in the coming winter, at 8*s.* per dozen.

VERBENAS.—All the new Varieties let out by Smith, Bragg, Mochett, and others, in 1854, at 8*s.* per dozen; older Varieties, 6*s.* per dozen—all well established.

FAIRY AND FABVIER ROSES.—Large healthy Plants, in 48s, at 8*s.* per dozen.

SEEDLING HERBACEOUS CALCEOLARIAS, AND SEEDLING CINERARIAS, at 5*s.* per dozen in October. These Plants have been raised from the Flowers which were so highly admired at this Nursery during last season.

FRENCH SPOTTED OR NEW FANCY GERANIUMS.—Well-established Plants of these beautiful Flowers, at 2*s.* 6*d.* each, or 25*s.* per dozen, in October next—a large consignment (including all the best raised in France, several of which have not been seen in England) having been just received at the Floral Nursery.

An immense stock of nearly all the new and best Bedding GERANIUMS, FUCHSIAS, HELIOTROPES, TROPÆOLUMS, and other Soft-Wooded Plants, always on hand, at prices equally low.

The Stock of SHOW and FANCY GERANIUMS at the Floral Nursery is unquestionably the largest and best in the kingdom, no expense having been spared to render it perfectly unique; all the new plants of the best raisers are added as they appear. Well-established plants of upwards of 1000 sorts may be had early in October next, at prices which will place competition at defiance.

The trade fairly and liberally dealt with, and all plants sent out will be warranted true to name.

A remittance or satisfactory reference indispensable from unknown correspondents. Catalogues forwarded gratis.

JOHN WESTWOOD, PROPRIETOR.—August 26.

WILLIAM BARNES begs to call the attention of his friends and the public generally to his general stock, which will be found to contain the greater part of the very best things in cultivation.

CHINESE AZALEAS, all the best varieties that have been sent out up to the present time, great care having been taken in the growth of this beautiful family of plants, all the weak delicate growing varieties being selected and worked upon strong healthy stocks, and the plants are such as are rarely to be met with for health and vigour, and will bloom fine next season.

GERANIUMS, all the best fancies, large flowering kinds, and bedding, as well as the following variegated varieties, viz., Flower of the Day, Mountain of Light, Golden Chain, Silver Queen, Silver King, Attraction, Lady Cottenham, Brilliant, and Cupped Leaf.

Also the finest varieties of Delphiniums, French and Belgian Phloxes—many of them may now be seen in bloom.

Perpetual Blooming Carnations, fine plants that will bloom through autumn and winter in great variety.

All the new French and English Verbenas, fine strong plants.

Chrysanthemums, Pompons, and large flowering varieties; newest and best fine strong bushy plants.

Roses on own roots, comprising the newest and most approved kinds of Hybrid Perpetuals, Bourbons, Teas, Chinas, Noisettes, Hybrid Chinas, and Hybrid Bourbons. These have all been kept shifted into larger pots, and are now very fine strong healthy plants. Japan and other Liliums, of which W. B. has a very large stock, both in beds and pots.

A very fine selection of all the most approved kinds of Vines from eyes in pots, among them some extra strong plants of Black Barbarossa.

Antirrhinums, Pentstemons, Petunias, Heliotropiums, Lobelias, Fuchsias, and fine plants of Hydrangea japonica variegata.

Fine new Mushroom Spawn.

An inspection of his Stock is respectfully solicited.

N.B.—Catalogues can be had on application.

Camden Nursery, Camberwell, London, August 26.

HOLLYHOCKS, DAHLIAS, AND DUTCH BULBS.

GARAWAY, MAYES, AND CO. beg to call the attention of Florists, and the Public generally, to their large collections of HOLLYHOCKS and DAHLIAS, which comprise all the newest and choicest varieties in cultivation, and are now coming into full bloom, and which they will be happy to show to all interested in these favourite Plants. Their Hollyhocks this season are particularly fine, and in addition to their collection of named varieties, they have an unusually fine batch of Seedlings, from seed sown in the spring of 1853, now in bloom.

G. M. & Co. also beg to announce that they are now receiving their annual consignment of BULBS from Holland, comprising Hyacinths, Tulips, Crocuses, &c., which are this year in good condition and moderate in price.

Priced Catalogues of Dahlias, Hollyhocks, and Dutch Bulbs may be had on application.—Durdham Down Nurseries, Bristol.

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind; it is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2*s.* 6*d.* per packet, postage free (or penny postage stamps to the amount).

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

HUGH LOW AND CO. would inform their friends and customers that they are now receiving their BULBOUS ROOTS from Holland. The collection comprises all the kinds of Roots suitable for early forcing, and they have been selected with care from the leading houses in Haarlem. Any orders entrusted to them will have every attention, and they feel satisfied they are in a position to supply them to the satisfaction of their customers.—Clapton Nursery.

STRAWBERRY PLANTS.—The best varieties for early and late growing, which have been thoroughly proved and given every satisfaction, are the undermentioned first-rate varieties, now ready.

Nimrod, 15*s.* per 100; Ajax, 5*s.*; Ruby, 5*s.*; Prince of Wales, 10*s.*; Trollope's Victoria, very superior, 5*s.*; Myatt's Surprise, 3*s.*; Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 3*s.*; British Queen, true, 3*s.*; Alice Maude, 3*s.*; Black Prince, very early, 3*s.*; Eliza, 3*s.*; Prolific, very fine and early, 3*s.*; Cremont's Perpetual, or Double-bearing Strawberry, 3*s.*

A remittance must accompany the order, either by Post Office Order or Penny Postage Stamps, on receipt of which the plants will be sent in hamper and package free, for all orders above 5*s.*

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

THE GRAPE BLIGHT.

M'ADAM'S COMPOSITION (used in the Royal Establishments), is promptly destructive of Vine Mildew (see *Gardeners' Chronicle* of May 27, June 10, and July 1), the Peach, Melon, Cucumber, Rose, and Vegetable Blights.—1 lb. packets for 18 gallons of wash, with full instructions, 3*s.* 6*d.* each.

Agents:—DAWE, COTTRELL, & BENHAM, Seedsmen, 36, Moorgate Street, London. Order through any Bookseller.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.

It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

THOMAS MILLINGTON requests attention to his present prices of SHEET GLASS in 100 feet boxes.

Squares	6 by 4 and 6½ by 4½	... ...	13 6
"	7 by 5 and 7½ by 5½		
"	8 by 6 and 8½ by 6½	... ...	16 3
"	9 by 7 and 9½ by 7½		
"	10 by 8 to 12½ by 9½	... ...	19 0
"	12 by 10 to 24 by 14		

Orchard House Squares on Mr. Rivers's approved plan, to whom I have sold some thousands of feet:—20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20½ by 12½, 20½ by 13½, 20½ by 14½, at 19*s.* per 100 ft.

200 feet cases at 42*s.*, and 300 feet case 63*s.*, in large sheets.

Boxes charged 1*s.* extra per 100 feet, and the same allowed if returned free of all charge.

HARTLEY'S PATENT ROUGH PLATE GLASS, Fern Shades, Striking Glasses, Milk-pans, Bee Glasses, Cucumber Tubes, Sheet and Rough Plate Glass Tiles, Wasp Traps; Plate, Patent Plate, Crown and Sheet Window Glass, in every thickness and quality, and Ornamental Glass, plain and coloured; pure white Shades for Ornaments, Crystal Glass for Pictures.

Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

Packed in Boxes of 50 feet each.

6 by 4 and 6½ by 4½	... ...	10*s.* 6*d.* per box.

8 " 6 " 8½ " 6½	... ...	13 6	"
9 " 7 " 9½ " 7½ and 10 by 8	...	15 0	"

For larger sizes a full List of Prices will be sent on application. Boxes are charged 2*s.* each extra, full price allowed if returned free of expense.—For further information apply to

JAMES PHILLIPS & Co.,

116, BISHOPSGATE STREET WITHOUT.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful as well as the most useful kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set off.*"—*Gardeners' Chronicle.*

DAVIS'S EXTRAORDINARY EARLY WINTER VETCHES,

REPORTED BY THE REV. A. HUXTABLE TO

THE ROYAL AGRICULTURAL SOCIETY,

To be at least ONE MONTH *earlier than any other Early Vetches, and proved to be so by many first-class Farmers in Wilts and Dorset, may be procured of*

B. PAGE & CO., SEED MERCHANTS

To the Agricultural and Horticultural Society of India,

At Mr. Davis's price, viz., 42*s.* per bushel, 11*s.* per peck, they having purchased the stock grown by a gentleman, which, being limited, early orders are requested.

TRIFOLIUM INCARNATUM, fine English ... 5*d.* per lb. | NEW ITALIAN RYE-GRASS ... ... 30*s.* to 35*s.* per qr.
PERMANENT GRASSES FOR PASTURE AND LAWN, equal to any house in the trade, PAGE & Co. having devoted their attention to this department for a number of years.

N.B. See Forty Acres Southampton Public Land sown in April last.

OXFORD STREET SEED STORES, SOUTHAMPTON.

THE

NEW RHODODENDRONS OF ASSAM AND BOOTAN.

COLLECTED BY THOMAS J. BOOTH, ESQ.,

And described in the "Journal of Botany," by his Uncle, THOMAS NUTTAL, Esq., *of Rainhill, the well-known Botanist and Traveller.*

E. G. HENDERSON & SON

HAVE much pleasure in announcing that they have for Sale these, the most remarkable new species of RHODODENDRONS ever introduced into the country, many of which surpass those from Sikkim, discovered by Dr. Hooker. Amongst these brilliant discoveries from the Bootan Alps are the most wonderful-sized flowers, delicious fragrance, and distinct colours of any that are known to exist in this the most gorgeous tribe of plants; and being combined with magnificent foliage, and distinct habit of growth, will render them indispensable, and a great acquisition both for the garden and conservatory.

The entire Stock of all these extraordinary species now growing (June 16, 1854) in the gardens at Rainhill have been purchased by them. The plants are fine, healthy, and robust. Many have been planted out in the open ground, and have proved quite hardy, with the exception of one or two slightly injured by late spring frosts.

They are now taking orders for six of the most distinct species, which will be dispatched in October. Full descriptions and prices may be seen on referring to the *Gardeners' Chronicle* of July 1, or in their

NEW CATALOGUE FOR 1854, NOW PUBLISHED,

and which will be forwarded post free on application.

Wellington Nursery, St. John's Wood, August 26.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9*s.* per dozen. A list of names forwarded upon application.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Established plants, in 3-inch pots, at 3*s.* per dozen.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

CHRYSANTHEMUM, "ANNIE HENDERSON," 7*s.* 6*d.* each, or four Plants for 21*s.*

HELIOTROPIUM, "BEAUTY OF THE BOUDOIR," 5*s.* each, or six Plants for 21*s.*

The above Plants are now ready for distribution; they are both the finest in their class, and possess very useful qualities. The descriptions of them, and the following, can be seen in the Catalogue of MESSRS. E. G. HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, which will be forwarded post free, on application.

The new French Spotted Geraniums, 5*s.* and 7*s.* 6*d.* each, according to size. The five new bedding Calceolarias, 31*s.* 6*d.*

NEW FUCHSIAS, VERBENAS, AND PETUNIAS OF 1854 AT REDUCED PRICES, with other NEW and SELECT PLANTS.

For BASS AND BROWN'S Advertised Lists of the above, see *Gardeners' Chronicle* of July 22 and 29, and August 5.

SUPERB NEW CHRYSANTHEMUMS.

12 best new Pompone varieties of last season ... ... 12*s.*
10 best new large flowering do. do. ... ... 10*s.*
60 splendid varieties of Pompone and large flowers, including new, 40*s*, or, per dozen ... ... 9*s.*

These are all fine and strong for flowering.

Catalogues free for three penny stamps. Post-office orders payable to BASS & BROWN, or to STEPHEN BROWN, Post Office, Sudbury, Suffolk.

HOLLYHOCKS.—A collection of this fine old English flower, grown at the Cheshunt Nurseries, is now in bloom, and there will be a succession till the end of October. Admirers of the Hollyhock are respectfully invited to visit the Nurseries to inspect them. In addition to the choicest varieties of other growers, there are many rare and beautiful kinds of their own production, and to be seen only at their grounds.—A. PAUL & SON, Nurseries, Cheshunt, Herts (13 miles from London, on the Cambridge line of Eastern Counties Railway).

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, August 26.

CUTHILL'S EARLY BLACK PRINCE and LATE PRINCE OF WALES STRAWBERRIES.—Very strong rooted plants will be ready August 28; the Black Prince 5*s.* per 100, the Prince of Wales 10*s.* per 100. The two sorts lasted in successive bearing this year for 75 days, in the open ground here. The Prince of Wales is a handsome and good flavoured dessert fruit, and the best late preserver; hundreds of ladies round here have proved it for these last three years.

J. C.'s Pamphlet on the Potato Culture, containing the best and only way of growing early and large crops, and avoiding the disease. It also contains 20 more articles upon the Strawberry, Rhubarb Wine, &c. Price 2*s.*, or by post 2*s.* 4*d.* Post-office orders on Camberwell Green.—JAMES CUTHILL, Camberwell.

The Gardeners' Chronicle.

SATURDAY, AUGUST 26, 1854.

ONE remarkable feature of the vegetation during the present summer is the extraordinary degree to which the foliage of plants, of almost every kind, is disfigured by the SOOT-FUNGUS, a parasite appearing in the form of dingy black patches, spoiling their beauty, and often impeding their functions so much as to cause their premature fall. The affection is one which is very general, and by no means confined to the colder parts of Europe; and similar affections, in an extremely exaggerated form, frequently occur, not only in other temperate climates, but even under the tropics. Here the patches are, for the most part, mere dingy strata of a somewhat pulverulent or membranous appearance, according to circumstances, rarely assuming a felt-like appearance; but in New Zealand, Campbell's Island, the Auckland Group, and in many other localities, they put on a looser and more filamentous habit, disfiguring everything on which they grow; while in some parts of the United States a particular form, according to the degree of moisture, appears under the guise of large spongy or lava-like masses of considerable extent and thickness. The genera Antennaria, Capnodium, and Scorias, mixed with such productions as Triposporium, form the principal part of the thicker strata; but the pest of our own woods and gardens, though capable of being referred to a dozen genera, according to varying circumstances, is all due to one and the same species, and that the common Cladosporium herbarum. The felt-like patches are far less common in England, and, like the exotic forms, belong to other genera.

The first cause of the evil is the copious deposit of honey dew upon the leaves, whether accompanied or not by different species of aphis, and it is consequently upon the upper surface of the leaves only that for the most part it makes its appearance. As the stomates are comparatively few in number there, and the under side is, in great measure, free, the injury to the leaves cannot arise from any impediment to the entrance of air into their intercellular cavities, but rather to the immense diminution of light, which must be caused by the thick veil drawn over them.

The velvety forms which infest the Orange, Olive, and other trees in the South of Europe—Madeira and the Azores—is usually accompanied by a species of coccus, as is also the case in the Coffee plantations of Ceylon, which suffer from a similar affection; but we are unable to say whether the presence of insects is universal. As regards the structure of our own smutty fungal, nothing can be more puzzling to the young student, and few productions more instructive as to the various forms which the same plant is capable of assuming. We have figured several varieties, but we could have multiplied these to a very considerable extent, as Dr. LÉVEILLÉ has placed in our hands specimens, on many different leaves, from various parts of Europe and the more contiguous regions of Asia. The thicker forms have been illustrated in two articles in the Journal of the Horticultural Society of London. Information will be found respecting that more immediately under consideration under Cladosporium herbarum in the "English Flora," and Cladosporium

Fumago, in FRIES' "Systema Mycologium," but the learned Swedish mycologist had no definite ideas as to the real nature of the different forms which he had before him. Other fungi forming a much thinner and closer stratum abound in tropical fruit, and are not entirely wanting in our own. These have a totally different structure, and belong to Asterina and allied genera. Our figures represent:—

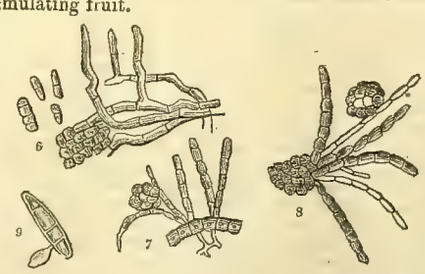
1. Cladosporium herbarum on Hawthorn, forming a thin cellular membrane, with large lacunæ and erect threads occasionally arising from little elevated patches.

2. Necklaces of cells springing from delicate colourless threads on Hazel. These ultimately are often dilated above.

3. On Quercus appenina. The subjacent membrane is extremely delicate, assuming here and there a cellular aspect, and is studded with little heaps of darker cells, some of which have a colourless thread attached, so as to resemble spores of Mystrosporium.

4. On Salix aurita. The threads still form a membrane with lacunæ, but are looser, and some of them rise from the surface.

5. On common Oak. The threads here are more hyaline, and produce large globular solitary cells simulating fruit.



6. On Populus canadensis. The cells, as in No. 1, are connected with the common fructifying form of Cladosporium.

7. On Privet. The threads approach in character those of Antennaria, and a separate globular mass simulates the fruit of that genus.

8. On Prunus Mahaleb. Another form, somewhat similar to the last, exhibiting pseudo-fructification. The threads here arise from a membranous expansion similar to that in No. 1.

9. On Tilia. A spore producing a new reproductive body from its side, very much after the fashion of the bodies observed on the spores of Dacrymyces by Tulasne. *M. J. B.*

ALL who are acquainted with the old CONTINENTAL GARDENS must have remarked the starved condition in which their hothouse plants are often found. Long-legged half naked stems, small sickly leaves, red spider, and all the other indications of a bad atmosphere, were the rule in 1818, when we first knew Belgium and France, and seem to be so now in many a remote town. And so they were, and so they still are, in even this horticultural country. So far as France was concerned, it always appeared to us incomprehensible what evil influence could be at work to counteract the efforts of gardeners thought to be skilful: and though crowding, bad heating, an uncontrollable dry summer, and underpotting, offered to a considerable extent an explanation of the fact, yet there appeared to be something still behind. A late number of the "Revue Horticole" seems to explain the mystery.

It would appear that in France there is no settled opinion as to the time of syringing hothouse plants, if they syringe at all. "Some," says M. DELAIRE, "pretend that the operation should be performed in the morning, before plants are heated by the sun; others prefer midday or the evening. Which is right nobody knows." If this be the state of French gardening, no wonder that plants should succeed so ill in their hothouses. There is not an apprentice with us that would not stare at being ordered to syringe his plants in the morning or midday; at least there should not be. People might as well water their outdoor plants in the morning or at noon.

Syringing is the imitation of rain or dew; of rain when water is dashed violently upon leaves; of dew when it is forced through fine roses and gently deposited upon leaves. We English confound the two operations under one common name; but it would render horticultural writings more intelligible if the term SYRINGING were confined to the imitation of rain, and the more gentle method were denominated BEDEWING. The French call the latter *bassinage*, and it is with that which we have to do on the present occasion.

In this, as in all things else, the operations of Nature should be imitated with all the exactness possible; we may be certain that what we call Nature is right, and that we, when we neglect her precepts, are wrong. Is dew deposited in the morning? or at noon? No. Then bedewing at noon or in the morning is unquestionably wrong; we want no argument about the matter. Dew falls in the evening, clings to plants during the night, disappears as the sun gains power. Bedewing, then, should be effected in the evening, and in such abundance that it may remain for dispersion by the returning sun. No reasoning is needed to show that this is right. We gather from M. DELAIRE that the French gardeners never think so. Is it possible?

When plants are bedewed at night, no perspiration is going on; all the surface is engaged in absorption. In this way the loss of fluid by day is virtually repaired. During the dark hours the tissues absorb the moisture in contact with them; drooping leaves straighten, bending stems stand once more erect, and the very hairs that clothe the surface of a leaf, on which they lay relaxed at sundown, presently fill, stiffen and rise up, and drink till they can drink no more, the limpid fluid at last hanging in drops from their gorged points. Were it otherwise, vegetation would perish in the autumn, however vigorous it might have been during summer; for in autumn the earth is exhausted of its moisture, and plants feed chiefly by their green surfaces. Each returning sun expels from a plant more fluid than the earth can possibly supply; but the waste is amply made up by the dews which act from sunset to sunrise. What occurs out of doors also occurs in a hothouse, so far as waste of fluid is concerned; but there is little or no restoration there at night, because dew will not form beneath a glass roof, and therefore the process of artificial bedewing becomes indispensably necessary.

Bedewing by day will not answer; it does in fact more harm than good. M. DELAIRE finds that when plants are so treated they lose their verdure and become yellow, especially if the sun shines on them immediately after the operation. Certainly it does no good; for it dries up before it can be absorbed. Certainly too it does harm; for the rapid evaporation from the surface of a wet leaf under bright sun is attended by a degree of cold which paralyses the vitality of the leaf itself. When rain falls by day the sky is overcast; or if we have a rainstorm in sunshine the occurrence is casual and the effect is transient, but in a hothouse so mismanaged a gardener has to encounter the consequences of a continually recurring bad effect.

It would appear from the memorandum which has led to these remarks that M. DELAIRE, who does not approve of dew falling at noontime, has been singularly successful in the cultivation of an unmanageable plant of very great beauty, the *Poinsettia pulcherrima*. M. CELS is represented as having declared that he never before saw so well flowered a plant as one managed by that gentleman in the Botanic Garden of Orleans. The following account of the process by which such great success was attained will be read with interest. The specimen was planted in the open border, at the (back?) wall of an Orchid house. In the spring of 1852 it was a long-legged plant, with four arms which had

been cut back after flowering. These arms had each formed two strong laterals, which, as usual, lengthened without branching. Had the plant been then left to itself, as is often the case, the specimen would have been poor and starved (*très-mesquine*). But each lateral was pinched back to three eyes, from which secondary branches soon proceeded, which, in their turn, were pinched back like the others, and the same process was repeated till the month of October. By this time the shrub had formed a heap of verdure above 6 feet wide, and had more than 100 branches, each of which produced its tuft of scarlet plumes. What a magnificent specimen it must have been! Even the Chiswick exhibitors would have turned pale at the sight of so formidable a rival. Of course M. Delaire bedewed this plant in the evening. As for the soil, it was a mixture of peat, decayed vegetable mould, and loam (*terre franche*) in equal parts.

VEGETABLE PATHOLOGY.—No. XXXIV.

153. Plants are no more capable of living without air than they are without moisture. As the spongelets perform the office of the villous processes of the stomach, imbibing those juices which are to be assimilated, or when they have given out whatever may be necessary for the exigencies of the plant, eliminated from the system, so by means of the stomates the tissues are in immediate connection with the outward air, exactly as the minute ramifications of the lungs in animals place the outward air in direct communication with that which is contained in the tissues, with the intervention only of a delicate membrane, through which the constituent gases enter at different rates, according to their different degrees of penetration, while those which are contained in the plant are given out, and thus oxygen is imbibed or eliminated, according to the absence or presence of light.

154. It is evident that any marked change in the composition of the air, or any sensible admixture of extraneous gases, must prove highly injurious to structures so highly susceptible of modification as those of plants, and which receive their nutritive matter under a form so greatly attenuated as vegetables, in which admixtures of very small quantities of adventitious matter, or even of those matters which are most necessary to health beyond the normal quantities, or in proportions varying very sensibly from those which are calculated to preserve a plant in complete health and vigour, soon impair the walls of the cells and then vitiate the matters contained in them.

155. Now the constituent parts of the air are the same in different parts of the world, as far as has been ascertained. Like a sponge, it holds very variable quantities of water in its interstices, and must of course be locally affected where large quantities of gaseous matter are poured into it, as in the neighbourhood of chemical works and large towns, where enormous quantities of fuel are consumed, involving an immense consumption of oxygen, and the accession of large quantities of heterogeneous gases, arising from the foul air exhaled, the products of putrefaction, fermentation, and the artificial production of noxious gases. In the case of chemical works the effect is notorious. In the neighbourhood of some the air is so sensibly impregnated that no vegetable can remain in health, and the largest trees speedily fall a sacrifice. The injurious effects produced on vegetation in large towns arises partly no doubt from the quantity of impalpable matter wafted about in the air, and deposited on the foliage, clogging up the stomates, and thus suffocating the plant, or preventing the proper action of light and inducing chlorosis; but there can be no doubt that the difficulties which impede the cultivation of plants in such situations, especially of those which delight in the pure air of Alpine regions, arises from the gaseous matter mixed with the air, which depresses the vital functions, induces disease of the cell walls, and ultimately death.

156. It has been asserted with much confidence that the increased consumption of coal and fuel, especially since the introduction of railroads, has made so much difference in the constitution of the air, that disease has, in consequence, been produced in the vegetable world, and that even mankind has suffered from the consequent introduction of new diseases. If, however, we reflect on the small proportion of land to water, and the almost infinitesimal proportion which that portion of the atmosphere which is immediately affected by any increased combustion bears to the whole firmament, it is at once evident that no such alteration in the general composition of the air as can effect vegetation can possibly exist. If the diseases—such as the mildew of Vines and Potatoes—were confined to those portions of the earth where the increased consumption of fuel takes place, there might be greater reason for the supposition; but when it is considered that Madeira has suffered equally with, or even worse, than other countries, in spite of the intervening ocean, and certainly without any marked increase in the consumption of fuel, it seems childish to enter into any computation of the possible change, especially when it is considered that in such questions it is quite impossible for us to eliminate every source of error. *M. J. B.*

THYRSACANTHUS RUTILANS.

This is one of the most useful plants of recent introduction, and although never likely to be a favourite where only dense compact specimens are looked upon as worth cultivation, it is, nevertheless, a very useful plant for winter flowering, and will, doubtless, be largely grown for this purpose. The bright scarlet tube-shaped flowers are produced for months in succession on drooping spikes, some two or three feet long, which look interesting, and form a fine contrast with other plants. So far as my own experience goes, however, there is no possibility of inducing it to form a compact, well-furnished specimen, for if stopped to the extent necessary to do this, it loses its leaves, and refuses to grow at all. But this is of very little importance, as if a large bushy specimen could be grown, the flower spikes, except those from the outside shoots, would not be seen to any advantage.

Cuttings planted in sandy peaty soil, covered with a bell-glass, and placed in a sharp bottom heat, soon emit roots, and if these are put in early in spring they will form nice plants for flowering next winter. The cuttings should be potted singly as soon as they are well rooted, and placed in a close, moist, warm pit or house, till well established; and if they can be afforded a gentle bottom heat, this will greatly assist in promoting the emission of roots, and inducing full growth. The young plants must never be allowed to suffer for the want of pot room, as this tends to make them even more leggy than they are naturally inclined to be; therefore, until the plants are in their flowering pots, attend to shifting before the balls get over matted with roots. The best situation for the young plants during the growing season is a pit or house where they can be kept rather warm, close, and moist; and if they can be afforded a gentle bottom-heat, this will be of great service in promoting vigorous rapid growth. A slight shade will be necessary on the forenoons of bright hot days, and the plants should be sprinkled over-head morning and evening in fine weather, affording them a liberal but careful supply of water at the root, and giving weak manure water occasionally to those that have well filled their pots with roots. Beyond keeping the centre shoot secured to a stake, very little good can be done in the way of training or stopping, for the plant never seems to grow freely or with any vigour, except when one shoot is allowed to take a decided lead of the others. Side shoots, however, are produced very freely when the plants are grown rapidly in a brisk moist temperature, and kept near the glass, and these should be slightly tied out without bending them down, so as to afford the foliage sufficient space. The habit of the plant, however, although it is what is deemed bad by plant growers, is exactly suited to the inflorescence, for the long drooping spikes of bright coloured flowers would not be half so effective if produced on dwarf bushy plants. But if, from any cause, side shoots are not produced freely, the plant should be bent down, leaving the eyes which are wished to start into growth the highest, which will check the growth of the leading shoot, and more effectually promote the growth of others than stopping would do. Discontinue shading and expose the plants freely to sunshine after August, admitting air more freely, to induce short-jointed wood. Attend, however, carefully to watering, and do not let them sustain any check, as with proper attention they will grow very freely till late in autumn. If the plants are wanted to flower early, they should be sparingly supplied with water, and kept rather cool for a few weeks; but they must not be allowed to get too dry, as this would injure the foliage; and, except for plants that are wanted to flower early in winter, there will be no artificial treatment necessary to induce them to flower profusely, which they will do from January till May. The time at which they will blossom will, however, depend upon the temperature; for, unless this is rather warm, they will not flower so early. When in bloom, they must be kept in a temperature of not less than 55° or 60°; for the flowers do not open in the temperature of an ordinary conservatory, nor do the spikes attain any length in a cool place. In order to preserve the plants in beauty as long as possible, avoid wetting the flowers in syringing, and keep the plants in good health by attention to watering, &c. After their beauty is over, remove them to where the temperature may be kept at about 50°, and allow them a month or six weeks to recruit their energies after blooming, cutting back the shoots as may be deemed proper. Before placing them in heat, give a liberal shift if necessary, and when the buds start keep the stronger shoots tied out, bending down and stopping any that may incline to outgrow the others, and syringe, &c., as recommended for last season, only that bottom-heat may be dispensed with in the case of plants that are some size. And as there will be no necessity to keep them growing late in autumn, a plant or two for early flowering may be removed to a rather cool place and sparingly watered until the growth is checked, and then returned to the stove, where they will soon flower.

The Thyrsacanthus is a vigorous grower, and not very particular as to soil, except that it should be rich and light, and efficient drainage should be secured in potting. About equal portions of turfy peat and loam, with plenty of sand, will suit perfectly, and a little thoroughly decomposed cow-dung would do no harm. *Alpha.*

CULTIVATION OF THE PEAR TREE.

On attentively perusing the observations in the *Gardeners' Chronicle*, at p. 499, and those by Mr. Rivers, pp. 516, 517, on the subject of my previous communication, I find that I may not have clearly expressed my views respecting the standard Pear trees which I have remarked near London.

In the first place, I must state that I am far from being an enemy to theory; for every good theory must be founded on sound practice. In the application of principles, the practical man should know when to deviate from them, and how to supply their defects. In fact it is he who suggests to the theorist that which becomes the basis of a formula. This being admitted, we shall pass on to another series of considerations.

To succeed with any plantation, it is not sufficient to possess a knowledge of the principles of the science, but a certain amount of experience is also necessary. The greater the difficulties which have to be overcome, the greater are the cares and precautions necessary to ensure success. The question must be considered in all its aspects.

In the first place, it is to be presumed that the primitive type of the Pear tree is foreign to our climate. The cultivated varieties have been raised from seed, and are the result of successive crossings made during 20 centuries. The most vigorous and hardy have originated in our own times, and are mostly due to Belgian sowings. (We shall return to this point on another occasion.) It is our duty to preserve these varieties in all their natural vigour, by employing strong wildings for stocks, and by judiciously selecting grafts which are capable of transmitting to their progeny all the inherent qualities of the individual variety.

We know perfectly well the difference which exists between the artificial culture on the Quince stock and in miniature, of which our honourable colleague, Mr. Rivers, gives an admirable example, and that of the culture on the Pear stock, both for dwarf and tall-stemmed pyramids. To the cultivation of the latter, and the most useful, our observations are more especially directed.

Among the new varieties obtained from seed by the late Van Mons, Esperen, Bouvier, and others, there are some varieties which are very vigorous, and which succeed remarkably well as standards. These varieties have succeeded well in our cultures and in those of our friends, and they must necessarily succeed in all similar situations. It is certain, that with respect to climate, there is a great resemblance between England, Flanders, and Brabant—the same latitude, and possessing in many parts the same kind of soil. These facts being established, let us return to the cultivation of the Pear tree as a standard on its own stock.

In raising young Pear trees from seed, in order to obtain new, improved, and hardy sorts, I remarked that the first fruits always appeared on the spurs formed on the upper part of the stock, that is to say, from 7 to 8 feet, or more, above the surface of the ground. The trees trained as pyramids only, showed fruit from year to year, so that fructification did not take place on all the lower branches till seven or eight years after the upper ones had fruited. This observation having been confirmed in our cultures, and in those of our friends, I believe that I may establish the principle, that the upper parts of a tree raised from seed are the nearest to a fruit bearing state; and, on the contrary, the lowest branches are the farthest from that condition.

Further, I have grafted a number of standards, some of which showed abundance of fruit the third year, whilst others which pushed vigorously gave no appearance of doing so after six years' growth, although the stocks sprung from seeds of the same sort of Pear—that called Cuisse Madame. In consequence of this prolonged sterility, I resolved to regraft the stocks by means of shoots situated above fruit-spurs; and the third year the trees thus grafted bore fruit. Will not this observation sufficiently justify my establishing another principle with regard to the graft?

I maintain these two principles as being of the greatest correctness, and founded on indisputable facts, of which I can produce numerous proofs in our cultures. I will suppose that these two principles are not new in practice, and that they are known to practical men, who would prefer to keep them as a secret among themselves.

To return to the subject of the article, we maintain that stocks grafted standard high, with scions taken from the upper part of a bearing tree, sooner arrive at a bearing state than those grafted low. A tree grafted standard high, for the open ground, the head trained so as to form a pyramid with a central vertical stem, with branches at equal distances and open angles, appears more likely to succeed near London than those which exist there at the present time. I have weighed the different causes which prevent the trees from bearing fruit, even in the most favourable years; and I hold the above opinion until proof to the contrary be produced. It is probable that if I lived for some years at Sawbridgeworth, I should perhaps discover other causes of barrenness in the nurseries of Mr. Rivers.

On quitting, about the end of May last, these extensive nurseries, which are placed in a very exposed situation, struck with the unfruitfulness of all the trees, large enough, in general, to bear fruit abundantly, I asked myself these questions. 1. If these trees had been judiciously pruned, and completely cleared of insects at the proper time, could we judge whether the fall of the scarcely-formed fruit is to be attributed to the variations of climate in April last or not? 2. Occupied perhaps for more than a century by fruit trees, has the soil preserved all the elements of nutrition; and have these indispensable elements been rendered to the soil in order to restore to it the powers of supporting vegetation which have been lost? 3. This soil, is it not of a stiff retentive nature; and from being too wet in winter, is it not injurious to the spongioles and radicles, of which the action on the formation of fruit-bearing organs is admitted by science and acknowledged in

practice? 4. Would it not be advantageous to make deep trenches or to thoroughly drain this, and all soils similarly situated, in order that the water in winter may run off easily, and thus to preserve the fibrils and spongioles of the roots, which are indispensable to the success of fructification?

And lastly, in a foggy, cold and changeable climate, with a heavy, cold and wet soil, no good mode of practice should be neglected when it is our intention to carry on successfully the planting of fruit trees in general, and that of the Pear tree in particular. Neither should we lose sight of the fact that the Pear tree appears to have originally been a native of low hills and other elevated situations, in more favoured latitudes than ours. Notwithstanding the changes effected by raising seedlings, the Pear tree has preserved, to a great extent, its original nature and constitution. In fact, in passing through the different provinces in England, Belgium, and the north of France, we remarked in situations such as those above mentioned, trees in full vigour. In carefully choosing the varieties of a fruit tree, originally a native of a southern climate, and which have been obtained from seed and acclimatised in northern regions, we ought not to neglect anything in selecting and improving the soil, or in respect to the different operations of pruning the tree. There are certain periods of the year when these operations should be performed. They differ essentially, according to the nature of the soil, the aspect, the vigour of the varieties, and the age of the trees. Each of these points deserve consideration in a separate article.

In conclusion, I am led to believe that the barrenness of the Pear tree in England is not to be attributed exclusively to the variations of climate, from the fact that near Brussels there are several gardens in which the trees are unproductive, from the same cause that affects those near London.

Finally, I have no personal interest in this question. By leaving matters on their present footing, England would remain tributary to Belgium and other foreign countries for a considerable quantity of fruit every year. Perhaps some of the more enterprising amateurs will pay attention to and profit by my observations. Their mode of culture will soon redound to their credit. Besides, it is only a tribute and a debt which I owe to your numerous correspondents, whose information has, in many cases, proved of great service to us. *J. de Jonghe, Brussels, Aug.* 14.

SOME

PRINCIPLES OF VEGETABLE PHYSIOLOGY,

BEARING ON THE CULTURE OF PLANTS.

By Professor W. H. DE VRIESE, of the University of Leyden.

(*Translated from the Dutch.*)

If we consider the vegetable kingdom attentively, we are astonished as much with the variety as with the greatness and magnificence of the phenomena which it offers to our contemplation. Almost every season, every day, every hour, and every place, present us plants under different circumstances, with peculiar qualities and in varied forms. Scarcely does the soft air of spring refresh the earth, when every object, in which there is still a germ of life, becomes developed with astonishing rapidity. The plants which spring has graced with foliage, summer decks with a multitude of flowers. In autumn the fruits are collected. In winter those plants, once so beautiful, are found to be some in a state of dissolution, others in a state of rest, or in a continued development, which proves that nature is engaged in an indefatigable activity. But, in winter, the greater number of plants die; the fallen foliage decomposes, returns into the earth, and becomes the rich source of nutriment for a succeeding growth.

But to judge of those changes which are observed in plants such long periods are not required. How great is the variety in the phenomena of flowers and plants daily to be seen! Observe them attentively early in the morning of June or July, when night has scarcely raised its dark veil, and when the sun is hardly risen above the horizon. Everything has another aspect than during the day. The flowers are closed, the leaves have changed their direction; those that were spread out seem disposed to close, and present quite another appearance than by day; you would even think them about to reunite into their former state of buds, and to return to a state of formation and development. The vegetable kingdom sleeps! However, not only the form and position, but also the colours, have quite a different appearance. The fields have often a green colour, like that of the waves of the ocean. And this is not only the effect of vapours fallen from the atmosphere, but also of the fact that the plants, by their altered directions, offer us surfaces that are differently coloured.

Another cause of this phenomenon is that on their surface a cover like wax is left, which the sunbeams cause to disappear afterwards, and then the original colour presents itself again. At mid-day all is in its full splendour. The flowers are opened, the leaves are spread out, and often they reflect the sun-beams from their shining surfaces; sweet smells spread over the fields; vegetation attires itself with its most magnificent raiment, and proclaims to the serious contemplator of nature the greatness and power of Him who called all things nto existence.

And in what state does the vegetable kingdom appear to us in the evening? While the last rays of the sun, the source of life in nature, yet linger in the west, the plants seem to be again in a deep sleep. The whole of animated nature, as if wearied with the day, inclines with them to repose. The birds and other animals, inhabitants of the woods, are silent, hiding themselves among the branches and leaves; the insects creep to their holes; silence and calm reign everywhere, till morning comes to revive the whole creation. When reflecting on all this, one tries naturally to mount to the causes which bring about such contrasts, and to give a reasonable explanation of them, which is not founded upon a principle already received, but on one derived from the very phenomena. The science designated the physiology of plants proposes to itself such investigations. A zealous and unprejudiced inquiry has already explained many difficulties. But when we consider the immense field of our labour, the knowledge which we possess is still very limited. There is much, perhaps, that we shall never wholly understand; but this must not discourage us from pressing forward. Every good observation, every remark is an element—a gain for science.

If the reader will follow us, we will centre our thoughts in the great laboratories of nature, and there observe attentively what are her actions, and in what manner she performs them; perhaps we shall be able to explain one or another of those great contrasts which we have just mentioned, and which, at first sight, do not seem susceptible of solution.

In considering a plant externally and superficially, we should not easily presume that its structure is so beautiful. However, it is composed of elements so small, that the most sharp-sighted eye is unable to distinguish them. For this we make use of instruments called microscopes, consisting of a series of polished glasses, which have the apparent power of enlarging small objects some hundreds of times, and which help us in finding out what it would be utterly impossible to perceive with our unaided senses.

The microscope was first invented in Holland about the end of the 16th or the beginning of the 17th century, and in late years it has been brought to a high degree of perfection. By means of it we learn that plants consist of membranes or vesicles, which are hollow, or rather fill up and inclose a certain space, and are generally spherical; which afterwards, on approximating one to another, change their form, and often become elongated, and when joined together form the body called vegetable tissue. This membrane is colourless and transparent, it has no openings and contains fluids, and in those fluids there are different substances, the productions of vegetable life, either in solution or in a solid state. The membranes take up fluids externally, particularly water; they bring them into the nearest vesicles or cells, and in this way the fluid, which the outer cells of the root take up from the ground, is carried up and circulated in all directions through the whole plant, and becomes the source whence are formed all the different organs of which the plants consist; and though all are formed upon one and the same principle, however, each is separately modified to discharge a more or less determined service, and to contribute its particular part in maintaining the organism of the whole. So the root has functions to perform quite other than the leaves, and again these serve to other purposes than the flower, the fruit, the seed, &c. Though the membranes which surround the cells are shut, and have no openings at all, yet they are pervious to fluids. This property is common to membranes of the bodies both of animals and plants. The most simple examples prove this. If I expose in the air a bladder filled with water and well closed, all the water will be lost by evaporation on the surface, and the bladder will fall together, though it has no openings. The thinner the membrane of the bladder the sooner all the fluid will be lost. If we expose membranes with each surface to different fluids, they penetrate through the membranes and mix with each other. The degree in which this takes place depends greatly on the nature of the substances which are used; the thinner fluids penetrate, however, in greater proportion than the thicker ones. This may be proved by a calf's bladder, half filled with the white of eggs, which, when put into water, will swell and burst; such a bladder, filled with water, being put into an albuminous liquid, will become empty and fall together. This is no doubt a remarkable property. The cavity which contains the thicker and more glutinous substance admits through the membranes of the cell a more fluid one. The same is to be observed in this respect in the membranes or vesicles of animals, and in the cells of plants. Gum, slime, sugar, albuminous and other substances are found in a smaller or larger quantity, in the cavities of the young cells of all, particularly younger organs; they are also present in those of the outer points of the root, which takes up from the soil a moisture, consisting chiefly of water, mixed with small quantities of different substances, soluble in that water. The moisture from the earth, being thinner than the fluids in the cells, penetrates the membranes of the cells in the roots, and with it those substances, the nature of which allows them to penetrate through the membrane and to mix and unite with the sap, are admitted into the cells; whereas, on the other hand, those substances which cannot be united with it, are not absorbed by the roots. It is as if the roots had a preference for some nourishing substances in the ground and a dislike for others; and it is alone by this that we must explain how some substances of the ground are taken up by the plants, and others not; why, in fine, each plant requires its own soil and is often unable to grow upon other sorts of ground.

(*To be continued.*)

Home Correspondence.

Woods and Forests.—In the *Gardeners' Chronicle* of the 29th ult., you have some remarks on the subject of the report of Mr. Drummond's committee on crown forests. I have myself just read that report, and beg to advert to one or two points in it. With reference to Alice Holt Forest, it is stated "the evidence adduced to the committee leads them to the conclusion that the management by the present surveyor has been satisfactory and judicious." I believe that just such a statement as this was expected to come from the committee; whether it fairly represents the truth of the case is yet to be proved. When I visited Alice Holt Forest in November, 1852, I found the greater extent of such drains as were on the land so overgrown with Grass, &c., that I frequently stumbled into them without previously observing them; and in them all there was a considerable depth of standing water, which could not escape except by percolation through the soil or by evaporation into the air. The trees on many parts were far apart from one another, and in consequence rough and branchy, while on others they were excessively crowded and drawn up to mere poles; those under both these conditions being of the same age. This I maintain was the truth of the case with respect to a considerable portion of Alice Holt Forest when I visited it; the management which brought about such a condition of forest matters is, however, styled by the committee "satisfactory and judicious!" On the ground of my report on this forest under notice, I was condemned and discharged from Dean Forest by the Treasury; and the only reason that I can yet assign for their dismissing me is that I endeavoured to give a true and faithful account of the state of the property. I could not do this without of necessity exposing the mismanagement of the deputy-surveyor, which course, it would appear, some parties in the Treasury did not approve of, so that I was thrown overboard for no other reason than that I unhesitatingly spoke the truth irrespective of party. In a former communication to you, I think about the middle of May last, I stated that I was prepared to prove on the spot and in the presence of impartial judges, the accuracy of the statements which I had made in my report respecting the size of the trees and the number of these on the acre in Alice Holt Forest,—the principal point in dispute between the deputy surveyor and me, and the one on the ground of which the Treasury thought proper to dismiss me from their service; but such an opportunity has not yet been granted me, nor have the committee even called upon me to ask me one question on the point. Their reasons for thus keeping me and my case so utterly in the dark are best known to themselves; but I would again thus call public attention to the manner in which I have been treated by the Treasury. In the case in question the deputy surveyor, who knows almost nothing about the culture and management of forest trees, is said by the committee to have managed "satisfactorily and judiciously," while I, who in justice to the public endeavoured to guard them against his mismanagement, have been condemned as far as the committee can condemn; for in their report they state (I presume respecting me) that, "It is to be regretted that Mr. Kennedy sent a stranger of very limited experience to examine and report upon the state of the Forest, without apprising either the Treasury or the local surveyors." As to this, I have only to say, that, however limited in their estimation my experience may be, it is too well known to the public generally for my reputation to stand much chance of injury from anything the committee can put forth. I ask nothing from the gentlemen of Downing Street than that the simple truth should be brought out as far as I am concerned, and this, I am persuaded, a discerning public will cause to be done ere long. *James Brown, Grantown, Strathspey, Aug.* 18.

Clerodendron fœtidum.—As it appears, from the interesting communications concerning this plant, that it may be considered root-hardy, the important question remaining is—whether it throws up flowering wood in the course of the summer. The Fuchsia does invariably; but it does not follow that whatever comes up again from the root will blossom. *A. H.*

Cucumbers, &c.—The gardener of the Rev. William Ponsford, the rector of this parish, has this year grown four plants of Cucumbers (Evans's Conqueror of the West) in a two-light frame, 7 ft. 9 ins. wide by 6 ft. 9 ins. long, from which he has cut 82 very fine fruit. He has also grown in the garden a plant of the Impatiens or Noli-me-tangere Balsam, which is very luxuriant, being 6 feet high and 13 feet in circumference, and covered with the pendulous blossoms. *William Collyns, M.R.C.S., Drewsteignton, Exeter.*

Manure and the Potato Disease.—There is here a field which has been for many years in Grass; it was ploughed the beginning of the year (February), and planted with Potatoes called Regents, and sprinkled with salt and soot. The Potatoes were in general free from disease, except in one corner where there had been a manure heap, and there (and extending for some distance from it on all sides) there is a considerable quantity of disease, both in the haulm and tuber, diminishing both in quantity and virulence as the distance from the former manure heap increases. *R. H., Putney.*

Pears, and their non-productiveness.—This season I have a fair average crop of Pears, and on three trees of an old kind, called "The Lammas," I have gathered 25 sieves of fruit for market, for which I received 3*s.* 6*d.* per sieve. These, however, have been the best of my

trees, other kinds have not been so productive, and some kinds have scarcely any fruit on them. Williams' Bon Chrétien, which I am now gathering, is not at all good, and the Jargonelle has been equally thin; while the Sweet Water, Green Chisel, and some others, having only local names, have been tolerably plentiful where the trees are healthy; but my orchard is old, and I find that the Pear is far from being so long lived as many people affirm. I took up about 20 large old trees that were dead, or nearly so, last winter, and I shall have some more to take up this season. It is, however, proper to observe that the trees had been cut down and grafted some years ago, but it is often just as the trees get into a bearing size again that they begin to die off; the disease seems to be an inability of the stock to maintain the top, and not in any way connected with the union of the two. Now, it is very unfortunate to see trees die one after another just when they arrive at a good bearing size. I am, however, no worse off than my neighbours, who all suffer in the same way, and trees planted, or rather growing on tillage ground, are equally affected with those on Grass; most kinds are subject to it, with me the best one to withstand the evil is the Ashdown Park, a small Autumn Pear, which also bears pretty well, but this season it is a failure. Marie Louise also succeeds pretty well, last year it bore an excellent crop, and this season it is tolerably good; the fruit of this kind is smaller on standards than on walls, but on the former it is much better flavoured. Beurré de Capiaumont is also thin, and the Brown Beurré still more so; in fact, the last-named is one of the shyest bearers I have. Of Glout Morceau I have but a few trees, but there is a fair sprinkling of fruit on them. Crassane is a total failure, and I have not a single fruit of Gansel's Bergamot; in fact, I have only one tree and some few grafts of this kind, which never produces a good crop. Beurré de Aremberg, and some others, are better; but as I only grow a very few of them, I cannot speak with certainty as to their productiveness. My principal autumn fruits are Marie Louise, Ashdown Park, and Duchess d'Angoulême, the two first-named especially, but as these rarely realise more than 6s. per sieve, and often much less, I do not think that Pears can be called a profitable crop; for even with the little attention and labour which I give them, they still cost a something, and the many adverse seasons we experience add materially to the expense of their culture. Now, having stated this much, what I want to know is, how am I to manage my trees so as to induce them to bear even in the worst of seasons, for be it understood I am far from believing that frost is the only enemy we have to encounter; in fact, I believe that frost often gets the blame that ought to be attributed to something else. Last spring we had no frosts here during the time in which the Apples were in bloom, and yet there is very little fruit, and the trees are in many places in an almost dying state. My opinion is, that where the buds of fruit trees are well formed and perfected in the preceding autumn, they will resist more frost than many people are aware of; but then, how are we to manage to get the buds so perfected? This question I must leave to your readers, and I shall be glad to be favoured with their opinion and experience on the subject. *H. L. H., Maidstone.*

Sulphuric Acid as Paint.—If any of your correspondents have tried diluted sulphuric acid instead of paint for preserving wood-work out of doors, they will oblige by stating if it has proved successful, and the proper strength to use. *B., Aug.* 19.

Red Tiles, their Colour Removed.—Having a cottage under one wide roof, in an exposed situation, I feared that the mass of red, unrelieved by the green of trees, would be too strong. I therefore heated half the tiles at the lime-kiln, and whilst warm tarred the outer side with gas-tar once only, the result is a pleasant brown. *Somerset.*

Stanwick Nectarine.—Having lately called at Trentham, I inquired of Mr. Fleming if he had succeeded in ripening this Nectarine; he replied that he had succeeded in ripening it well and of good flavour, the latter somewhat resembling that of a Green-gage Plum. His practice is to take a young shoot and inarch (or bottle graft) it on the points of the shoots of established trees of other varieties upon its own stock. He found it to grow too luxuriantly even under glass, and the fruit to crack and not ripen well. *William Adderley, gardener to M. Bell, Esq., Bourne Park, Canterbury.*

Aphis Rumicis.—It is singular that a species of plant louse, which is generated on the common Dock, should this year have infested the Turnip crops in Yorkshire. I received the following communication from a gentleman residing near Richmond in Yorkshire:—"I send you specimens of the insect that has committed so much injury on the late sown Turnips this year. Those Turnips that were put in previous to the 24th of May have escaped. All my Turnips had farm-yard manure applied, as well as 2 cwt. of guano. One part had bones instead of guano, which was much worse than the guano. The insects are invariably under the leaf. I have not, or rather I did not, find any to-day at the root. There are now few left. I had some difficulty to find a good sample for you, but I fortunately met with some winged specimens. I had nine acres of the Hybrid Turnips destroyed last year." In a former letter to the Secretary of the Royal Agricultural Society, the same gentleman stated that "hundreds of acres are almost destroyed by this fly in the North Riding of Yorkshire and Durham;" and he added, "I have five acres quite destroyed, and several more acres are more or less injured." Mr. F. Walker says that A. Rumicis is hatched on the Dock, and then migrates to the Bean, Pea, Thistle, Chenopodium, Laburnum, Broom, and Furze, but it is a new plague, I believe, in the Turnip field; as the only species hitherto known to injure the Turnip crops were Aphis Rapæ, A. dubia, A. Brassicæ, and A. Floris-Rapæ.* I believe A. Rumicis was very abundant last year in the north of England. About the beginning of this month there were myriads of this species in the neighbourhood of London, and on the evening of the 1st they were seen in prodigious numbers near Highgate, and soon covered the plants in the gardens, causing considerable mischief to the Dahlia buds. They died, however, in two or three days, after some very heavy showers. There is still a great deal to be learnt about these remarkable insects, for species which at one time seem to be attached to one plant suddenly affect others, and this may be the cause, in some instances, of their sudden death; as the sap of the Dahlia, for instance, may poison a species which was bred on the Dock, whilst the Turnip may be wholesome food for it. Electricity also appears greatly to influence the appearance and disappearance of the aphides. *John Curtis.*

Fluke Potato.—Allow me to inform Mr. Ayres that he need not be alarmed about the Fluke, as there are thousands of acres planted in this neighbourhood, all of which are in the best possible health, with not a symptom of disease about them at present. *J. D., Manchester.*

Water Weeds.—In an artificial stream and small ponds, concreted and cemented to keep the water clean and clear, we are puzzled to prevent the growth of a fibrous and slimy mass of vegetable matter, which accumulates upon the surface, and forms large patches beset with globular heads of water. In a young state, these masses or patches are bright green; but in the course of two or three days they change to brown; putrefaction, and a gradual subsiding to the bottom, then commences. Now these masses of vegetable matter sadly disfigure the water, more particularly the surface. Hitherto, we have removed it by manual labour, but it proves a "tax" which we ought to get rid of; and I am anxious to ascertain whether or not we can employ some cheap chemical agents to prevent or destroy its growth. Although the flow of fresh water is but small, yet it would weaken the power of the agent employed, and this would involve the necessity of a renewal half-yearly, or perhaps quarterly, as the case might be. I calculate the small ponds and streams to contain from 10,000 to 12,000 gallons, and about 200 gallons of fresh water pass through hourly. I may here state that we cannot obtain a stronger stream, as the supply is limited. We have no fish in these waters—consequently, animal life is no consideration. Would common agricultural salt placed at the head of the stream prove effectual? Any useful advice on the subject will be thankfully received. *W. C. E.*

Damp on Lime Walls.—The following not exactly literal extract from the great Liebig's "Letters on Chemistry" may perhaps help "D. V." and "Somerset" as to damp on lime walls. He is speaking of the means of purifying air for respiration, and says "hydrate of lime is a strong purifier" (in reference to carbonic acid, a product of respiration) from its great power of absorbing carbonic acid, which is rapidly removed from air by slaked lime on a board, 0.551 cubic feet, which, when moist, weighs 18 to 20 lbs., and contains two-thirds its weight of dry lime, absorbs in order to be converted into carbonate of lime 38.8 cubic feet of the gas. The inconvenience is that, as the lime combines with the carbonic acid, the water of the hydrated lime is set free and partly evaporates, and the air soon becomes saturated with aqueous vapour. This inconvenience is well known to those who inhabit new houses. It appears during the first months very strikingly in the winter months, by an excess of moisture, condensing in drops on the windows and cold walls. This is observed in houses which have for years been exposed to the action of dry air; and always for the first time such houses are first inhabited. It does not proceed from ordinary moisture in the walls, but from the dry hydrate of lime in the mortar, which only gives out the 24 per cent. of water (which are chemically combined in it) as moisture, when the lime obtains a supply of carbonic acid to combine with and displace the water. This carbonic acid to combine with and displace the water. This supply is abundantly furnished by the lungs of the inhabitants." The remedy, then, does not consist in building with hollow bricks, though they are excellent in themselves, but in providing for the removal of the carbonic acid and aqueous vapour produced by respiration; by the most efficient ventilation of the building; and that this is the fact I could give a case in point, but as it is not horticultural your journal is not the proper place. *J. P. S., Chesterford, Aug.* 22.

Notices of Books.

The Globe prepared for Man; a Guide to Geology. Adams. 12mo. pp. 339.

THIS little volume is intended as a school book, and the highest compliment that can be paid it is to say that it answers its purpose; for, of all things, school-books are the most difficult to write. The woodcuts, though coarse, are good, and the diagrams excellent. It would form a very useful class book for young people for the first time beginning geology. The style of the author may be gathered from the following fragments:—

"About 60 years ago Mount Hecla, in Iceland, threw out two streams of lava that ran for the distance of 40 and 50 miles. The streams were 10 and 15 miles wide, and 100 feet in height. Moving lava does not sink at once, like water, to the level of the ground. The stony liquid usually begins to flow out of the crater about as thick as honey, and when its outer crust cools, it stiffens with sufficient force to stand up like a high solid wall, yet continues to move on as if pushed forward. 'In the spring of 1852 a large mountain in the Sandwich Islands was presenting a beautiful and grand display of volcanic eruption. By accurate measurement, a column of glowing molten lava rose from the crater 500 feet in height and 100 feet across, presenting a sight that excited, even at a distance of 40 miles, the most lively feelings of admiration and awe. In some places the lava was flowing down the mountain as a river, a mile in width; at other points it had filled up ravines one, two, and three hundred feet in depth. It entered a forest, and the giant growth of centuries was cut down before it, like Grass before the scythe; no obstacle arrested its descent to the sea. Mounds were covered over, valleys filled up, and the habitations of man consumed like Flax in the furnace. The eruption began 10,000 feet above the level of the sea, about 50 miles from the Bay of Hela; and if it succeed in reaching the ocean, having filled up the ravines and inequalities of a very broken country, it will be one of the most extensive eruptions of modern times.' Sometimes jets of red-hot dust and ashes are driven by the wind to great distances, and, as they fall, set fire to whole woods and villages. During an eruption of the volcanic mountain of Truxillo, in Mexico, in 1835, its falling ashes killed thousands of cattle. Deer and other wild animals ran into towns for protection, their bodies, in many instances, becoming one mass of scorched flesh. Birds, as well as animals, for 24 miles round, were suffocated in the depth of the ashes, and all the neighbouring streams were completely strewed with dead fish."

"Rivers are great blessings to mankind; they afford an easy means of communication between distant places; they supply moisture to the air, and rich stores of water for our domestic, agricultural, and manufacturing purposes. They drain low marshy tracts, and greatly assist in clearing away decaying particles of matter. So various are the substances carried by river streams into the sea, that were the beds of our present oceans to be lifted up, we should behold strange treasures mingled together in their widely-extended layers of sand and mud. We should find the bones of all kinds of land animals, and the wood of trees from all countries, buried among sea weeds, beds of coral, sponges, shells, and skeletons of fishes, together with pieces of wrecked vessels, and shattered furniture. These substances are regularly laid in vast ranges or beds, just as different storms, currents, and eddies in the water have driven them forward over the bed of the sea, until they have finally settled upon its muddy shingly deposits; each layer having in its turn been the uppermost bed, so that if the bottom of the ocean were really to be lifted up, and our eyes were to behold its broken edges, we should find them matching our present sea cliffs, which often display many different materials resting upon each other; such as beds of sand on gravel, gravel upon chalk, layers of hardened mud upon pebbles, and pebbles upon sand. Several qualities of sand may often be seen in banks by the road side. At the top, vegetable mould generally lies, then, perhaps, layers of sand; below the sand may be a line of pebbles, or possibly a thin stratum of stone, and under these substances there may be sand again."

"The earth is a vast collection of minute atoms, forming a ball of heavy matter, flattened at its poles something like an orange. It hangs in the air upon nothing, and spins round itself in 24 hours. The centre or middle part of the earth is believed to be in a thick fluid state, because the flattened shape of the earth is the form that a thick fluid takes when rolling round in the air. And just as the juicy centre of an Orange is covered by two or three rinds, so around the fluid centre of the earth are many rocky layers of varying thicknesses, which are believed to form altogether a depth of eight or ten miles. Yet so large is our globe, that this depth of eight or ten miles is not a thicker crust upon its surface than a sheet of paper would be upon the surface of an Orange. What the fluid substance is that lies in the centre of the globe is not exactly known, but it is believed to be a mass of red-hot metals, about as liquid as iron and silver when, by intense heat, they are thinned down to the consistency of mud. The idea of the globe's internal heat is favoured by the fact that in various parts of the earth flames rise from cracks in the ground, and also out of summits of mountains. These flames are generally accompanied by smoke, steam, and red-hot muds, that roll down the sides of the mountains like broad rivers of fire. And in many parts of the world springs of water rise up sufficiently hot to break glass and to boil eggs. Another striking proof of the intense heat in the centre of the earth is, that the lower men descend under ground the warmer they find the air and rocks. Not that men have been able to go very far under ground; the deepest mines that have been sunk for the purpose of obtaining such ores as lead, silver, copper, and iron, do not exceed the depth of about one mile from the surface. If the workmen tried to go deeper, they would certainly be suffocated for want of fresh air to breathe."

We should add, that at the end of each chapter is a number of questions which the learner is expected to answer.

New Plants.

79. Alloplectus chrysanthus. *Planch and Lind.*

"This is the fourth species of this genus obtained from the inexhaustible flora of Columbia; several other species from the same countries, and not less beautiful than the first, will in turn, be ready for distribution. The species in question is quite as fine as its predecessor A. Schlimii. The leaves are large, with long stalks; their upper surface is like glossy velvet, and the under is of a violet purple colour. The flowers, which are numerous, are, as the name indicates, golden yellow, the corolla contrasting well with the lively red velvety calyx. This has been described by M. Planchon in the "Flores des Serres," t. viii., p. 211. It was discovered in 1851 by Mr. Schlim, who found it in the province of Ocaña, at a height of from 5000 to 6000 feet above the sea." *Linden's Catalogue*, 1854.

We hope this will prove a still handsomer plant than A. Schlimii, which, although not a favourite in England any more than A. speciosus, is a magnificent plant when really well grown, that is to say, when the true character of its glorious leaves are developed. Among plants with fine foliage these Alloplects are surpassed by few. We see it is marked 15 fr. in Mr. Linden's trade list.

80. Coutarea hiervilloïdes. *Planchon and Linden.*

"This is a shrub belonging to the natural order Rubiaceæ, and reminds one, by the size and shape of its flowers, of Weigela rosea. The flowers, of a pure white inside, and of a beautiful pink outside, form rich terminal panicles. The leaves resemble those of Lonicera tatarica and of Symphoricarpus, but are much larger. Introduced by Mr. Schlim, who discovered it in July, 1851, in the province of Ocaña." *Linden's Catalogue*, 1854. Sold at 25 fr.

Garden Memoranda.

Messrs. Lane's Nursery, Great Berkhampstead, Herts.—The culture of small fruit trees in pots, first introduced to notice by Mr. Rivers, has within the last two or three years been adopted to a greater or less extent by several of our leading nurserymen; but, perhaps, nowhere has the plan been more successfully carried out than it has been at Messrs. Lane's this year. Those who had the good fortune to be present at our great metropolitan exhibitions in July last, would see the Cherries and Currants which these gentlemen showed in pots, at that time; and now the display of Peaches, Nectarines, and Plums, which they have grown in this way, is well worth a journey to Berkhampstead to see. Several of the Peaches and Plums are ripe, and some have dropped; but the Nectarines are not quite so forward. Among Peaches all of them small trees in 10-inch pots, we counted 10 fruit on a Royal George, large and well coloured, some of them measuring 9 inches in circumference; on a Noblesse were 13 fruit; on a Bellegarde a similar number; on a Barrington 14; on a Millet's Mignonne a similar number, and on the Catherine Peach were 6 fruit. On a Red Roman Nectarine there were no fewer than 33 fruit; on a Murray ditto 17; a Newington 8; a Hunt's Tawney 16; and on a Violet Hative 22. On a very small tree of the Quetch St. Martin's Plum we counted 34 fruit, all ripe and in great perfection; and on Coe's Golden Drop were two fruit, unusually large and fine. Plums, we need scarcely say, succeed uncommonly well in pots, and if the fruit is kept from wasps, and allowed to hang on the tree till quite ripe, the flavour, in good kinds, is found to be delicious. We noticed one or two plants of the Stanwick Nectarine in pots, but its fruit was cracking and not swelling at all kindly. It is also later than other sorts, but Mr. Lane does not despair of yet having a few fruits of it in perfection.

As regards the kind of treatment pursued, the great object aimed at here (as it should be everywhere), is to get the wood thoroughly ripened and the flower-buds set early in autumn. This is effected by keeping the trees in the open ground plunged in beds, as long as the weather is fine; after that they are moved into a glass house open on one side, where they are wintered. In spring they are placed in the warm end of a long span-roofed house, in which they are allowed to remain plunged in sawdust till they ripen their fruit. This house is heated by a kind of Polmaise stove, and has constantly a nice circulation of air in it. It stands up and down a rather steep hill, and when we say that the plants were in the warmest end of it we mean the highest end, which is that farthest from the stove, and where there is nothing in the shape of scorching, but that mild agreeable warmth in which all kinds of plants so much delight. Under such circumstances, associated with skilful management, the result, as will be seen from what we have just stated, has been eminently successful.

The kind of soil employed is a mixture of loam and dung, and the plants were watered four or five times while they were growing, with liquid manure.

FLORICULTURE.

Pelargoniums.—As you have already given the mode of growing these useful plants for exhibition, perhaps the following remarks on their cultivation for the greenhouse of a private gentleman may not prove unacceptable, as my mode of treatment, though nothing new, has invariably been followed by an abundant head of bloom and healthy foliage. After the plants have flowered the first time, they are removed into the open air, placed upon cinder ashes, to protect them against the worms, and are cut down the beginning of August; in a fortnight the shoots will have pushed to about an inch, when I proceed to repot them. My practice is to shake off all the old soil, and to prune the roots to within 3 inches of the stem. This process I consider favours the production of a fine head of bloom, by checking the rapid and vigorous growth of new wood. The plants soon recover, and the destruction of the old roots is succeeded by new and active fibres from the points where the knife had been employed. The following compost I use for the winter potting, viz., two barrowfuls of loam, two of leaf-mould, half a barrowful of peat, with one peck of silver-sand. The plants are placed where they are partially shaded, receiving a little of the morning sun only; in three weeks they will have made new roots sufficient to bear removing to a more open situation, where they will receive plenty of light and air. Here they remain till the weather becomes wet and cold, when I remove them into the greenhouse. I place them as near the glass as possible, and admit all the air I can to prevent their being drawn, and water sparingly during the winter months. In October I stop the shoots to within four or five eyes of the stem. In the beginning of December I prepare to repot for blooming, using the following soil, which is richer and stronger than the compost previously employed. To two barrowfuls of loam I add two of cow-dung one year old (I prefer it of this age, as it affords nourishment a greater length of time), half a barrowful of leaf-mould, and one peck of silver sand. If the loam be heavy and strong, I add peat, but this is not necessary if the loam is of a sandy nature. I give good drainage by giving plenty of potsherds, and shift into pots a size larger than the plants were previously grown in—either 8 or 9-inch ones. I rub off nearly all the old soil and fill up with the compost above described. The house is kept closed for a fortnight or three weeks, and when I see the plants begin to root freely I give air as the weather permits; the temperature of the house ranges from 40° to 45° Fahr. when the plants are growing freely. I keep them well tied out, forming them into broad and uniform heads. I begin to syringe the plants about the middle of February (choosing the afternoon of a fine day for the purpose), and continue this operation twice a week till the plants begin to show their bloom. During the months of February, March, and April, I water twice a week, and increase the quantity as the weather becomes warmer. I fumigate for green fly, and shade from the midday sun. *S.*

Dahlias.—These will now require a considerable amount of care. They will not bloom well unless a degree of moisture is kept up at the root; and sedulous attention to this is indispensable. Many fine flowers are stunted in their growth, and deformed in their bloom, because the soil is too dry. Constant watering being attended with trouble, and also being undesirable, because it washes the best properties of the compost beyond the range of the roots, it is best to mulch the surface to about 9 inches all round the plant. I have known persons put the mowings of the lawn to this use, laying on a thick stratum of Grass round each Dahlia. Previous to this being done the soil must be thoroughly soaked, and one such watering will last for a week, although without the mulching, one dry day would render the operation again necessary. These mulchings should be kept moist, and this can be done by sprinkling a little water daily from the rose of a watering-pot. This is necessary to keep the soil beneath equally wet, and also to prevent earwigs and other insects from lodging in the Grass. Earwigs and woodlice hate a wet situation, and are always found in the driest places; hence, the wet state of the Grass will prevent their stopping among it. Earwigs are the worst enemies of Dahlias, feeding on the young and undeveloped petals of the flowers, as every amateur knows to his vexation. Perhaps the best trap is a small flower-pot at the top of the stake, for these insects seem to have a strong propensity to ascend as high as they can for a lodging. This may be turned to good account by the gardener, who will find the pots occupied every morning by the enemies he is in search of. I have killed many thousands in this way. In my neighbourhood earwigs are more than usually abundant, rendering watchfulness highly necessary. A little diluted cow-dung may be applied once a fortnight, and all decaying flowers should be cut off. These contain earwigs, which must not be allowed to run away. *D.*

Propagating Camellias: *J H.* They are increased by inarching, grafting, and budding on the single red and Middlemas red, cuttings of both of which strike readily. These latter should be taken off in August or September, as soon as the young shoots are ripe. They are prepared by being cut through horizontally at a joint, or better taken of with a "heel," divesting them of a few leaves at the base, and potting them in sand. They should then be well watered, and the pots placed in a cold frame for a month or six weeks. They may then be introduced into a gentle bottom heat, and potted off into small pots next spring; still keeping them in heat until they have made their growths, then gradually hardening them off. In the succeeding season they will be ready to be inarched, budded, or grafted.

SEEDLINGS.

Calceolarias, &c.: *Cheadle.* There is nothing remarkable in your seedlings.

Miscellaneous.

An American Way of Obtaining Prizes for Seedlings.—At a meeting of the Massachusetts Horticultural Society, held May 27, 1854, the chairman of a committee appointed for the purpose offered the following report:—The select committee appointed by this society to examine into all the circumstances attending the award to Messrs. Hovey & Co. of a gold medal, for a seedling Cherry, and a gratuity of 20 dols. for a seedling Pear, report the following facts: That at the last meeting of the Society (in 1853), previous to the incoming of the newly-elected officers and committees, the chairman of the fruit committee presented a draft of his report, which was recommitted to him for completion. That, in the draft of report so submitted, no mention was made of any award of medal or gratuity to Hovey & Co.; nor up to that time—the last day of their existence—had the question of such awards been discussed in committee. That after the adjournment of the society on the day above mentioned, and after the departure of the chairman of the fruit committee, C. M. Hovey called together three members of the committee (which consists of seven members) and urged upon them, very strenuously, the merits of the seedling Cherry, which he claims to have originated, and of the Pear, which he claims to have introduced. That two of the three members were of opinion that the Cherry had not been exhibited for five years, as required by the rules of the Society. This position was controverted by Mr. Hovey, who also contended that his seedling was conceded to be the best that had been exhibited. Your committee understand that, when the matter was pressed to a vote, one member (of those present) declined to vote, one other voted for the award of a medal, with the proviso that it should be proved to have been exhibited for five years, and the other member voted for the award without conditions. The vote upon the Pear was about the same. The committee are further informed, that the first intimation received by some members of the fruit committee that such awards were even contemplated, was obtained from the printed Transactions of the Society. In the opinion of your committee, this conduct on the part of a competitor for the highest premiums of the society ought not to pass unrebuked. Not only is it subversive of all order and good government that committees should be called together without proper authority, but the offence is magnified when the person usurping the powers of the chairman is himself the claimant before the committee—a party to a suit, before judges whom he may select for himself, and the ex-parte advocate of his own interests. The Society is wronged, because their rules are trampled upon; the committee is wronged, because they are deprived of the benefit of a full discussion and of time for consultation; the unnotified members are wronged because they are allowed no voice in the decision; the members present are wronged, because they are subjected to the personal solicitations and persistive pleadings of the applicant; other competitors for the premiums are wronged, for their claims are pushed aside; the public is wronged, because it accepts as the well-considered action of the Society what is, in truth, but the opinions of one or two members, hastily convened and hurried to a decision by the party most interested. If this instance of irregularity which has been brought to the notice of the Society is suffered to pass without censure, your Committee believe that the public will regard with diminished confidence the decisions of the Society; for they will, with reason, suspect that our medals and gratuities for new varieties of fruit, flowers and vegetables, are indices rather of the adroit management of the applicants than of merit in the articles. The number of exhibitors at our shows and of competitors for premiums will be sensibly diminished; for modest merit will have no chance against unscrupulous assurance. Already complaints, "not loud, but deep," have been heard, that rules, which are stringently enforced against some members, are broken with impunity by others. In view of the facts above stated, your committee present the following resolution for your adoption:—"Resolved, that the conduct of C. M. Hovey, a member of this Society, in procuring the award to Hovey and Co. of a gold medal for a Seedling Cherry, and of a gratuity of 20 dols. for a Seedling Pear, was irregular and improper, and is censured by this Society."

The Vine.—Among the instances given of enormous Vines, we may quote the following: Pliny records a Vine in the Porticos of Livia, which overshadowed the whole area used as a promenade, and yielded annually 22 amphoras (154 gallons) of wine; the same writer states that he had seen at Populonia a statue of Jupiter, made of the trunk of a Vine, and that the columns of the temple of Juno at Metapontus, and the steps of that of Diana of Ephesus, were also of Vine wood. In more modern days, Sodenini mentions a Vine in Portico di Romagna, which extended over 1000 braccia. In the Mémoires de l'Académie of Paris, for 1737, a Muscat Vine at Balançon, is described, which at 20 years old produced 4206 bunches of Grapes. Giovanni Targioni-Tozzetti, our author's grandfather, in his travels in Tuscany, quotes one in the woods near Montebamboli, the trunk of which two men could not embrace. Santi found a Vine at Castellottieri, in the Maremma, torn up by a storm in 1787, whose trunk is preserved in the botanic garden at Pisa, with a stem 5½ feet in circumference; and Prof. Targioni has himself recorded in the article "Botanical Chronology," in the "Dictionary of Natural History," printed at Florence by Botelli, two Vines near Figlini, in the upper Val d'Arno, with trunks 5 feet in circumference. The doors of the Cathedral of Ravenna are made of Vine wood. *Journal of the Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Acacias, Kennedyas, and other New Holland plants used as twiners, will flower much more profusely if they can be kept rather dry at the root during the autumn, in order to get the wood well matured, for unless this is effected it will be in vain to hope for a first-rate display of bloom. Care must be observed, however, not to let the soil about the roots become excessively dry; for although these plants are subjected to long periods of drought in their native habitats, and are said to be found growing in soil in which there is hardly any appearance of moisture, they cannot safely be subjected to such excessive dryness in this country; nevertheless, to flower them profusely, they must be as sparingly supplied with water after they have made their growth, as can safely be done. And this treatment will also be proper for many of the permanent occupants of the beds, that is, supposing they have made a fair amount of growth, especially the varieties of Citrus, which flower but very sparingly unless their young wood is well ripened. Shading, if not altogether dispensed with, must be used very sparingly, and unless we experience a decided change of weather there will be no danger in removing it for the season. Give careful attention to large valuable specimens of hard-wooded plants, removing decaying leaves immediately they are perceived, and see that they are nicely supplied with water, especially such as have been recently repotted, for they will be easily injured by any neglect or excess in watering. Many of the Fuchsias will now be past their best, and should be removed to make way for the Liliums, &c., and if cuttings have been rooted the old plants may be thrown away at once, particularly large specimens of worthless old varieties, with which it is folly to crowd the houses in winter, while immense specimens, for early flowering, may be grown from cuttings put in now. STOVE.—The unusual amount of cloudy damp weather which we have this season experienced has been more favourable to the rapid growth of stove plants than to securing short-jointed wood, or such as is likely to bloom profusely next season. It will, therefore, be necessary to pay timely attention to getting the young wood of such things as bloom upon last season's growth well ripened; for future success, either as regards growth or blooming, is more dependent upon having the wood well matured in autumn than persons not well conversant with the culture of plants are apt to suppose. Take advantage of any leisure time to get young specimens neatly tied, keeping the shoots rather thin, so as to expose the foliage to light and air, which will greatly assist in preventing mildew and damp in winter. Plants, however, which have not made their season's growth should be encouraged with as much warmth and moisture as they will bear; but avoid shading, which after this season would only tend to the production of long-jointed weakly wood. Gloxinias, Achimenes, &c., removed here after blooming in the conservatory, should be sparingly watered for some time, and not dried off all at once, which is a too common practice, and frequently results in the loss of a portion of the stock. Attend to the repotting of winter flowering stock, and do not let these sustain any check for want of pot room until they are in their flowering pots.

FORCING DEPARTMENT.

PINERY.—Plants growing in dung pits must be freely supplied with air, to prevent their getting drawn, &c., which is apt to be the case with plants in dung heat in cloudy weather. They should also be kept near the glass, and allowed plenty of space; for strong robust plants can hardly be expected unless this is attended to, and weakly drawn plants never throw up fine fruit. Give those swelling their fruit plenty of manure water, and afford them a thoroughly moist atmosphere. Remove useless suckers and gills, as soon as they are perceived, and maintain a steady bottom-heat of from 85° to 90°, but do not exceed this. Young stock in free growth and standing rather closely together should be rearranged, so as to afford them plenty of room, in order to prevent the foliage getting drawn; also attend to shifting any that require more pot room, keep them near the glass, and encourage rapid growth by means of a brisk moist temperature, giving sufficient air to keep them stocky. These will also enjoy a liberal supply of good strong clear manure water, particularly those that have well filled their pots with roots. VINERIES.—Where there is any danger of the border of the early house becoming too wet it should be covered with something to throw off the rain, as there will be considerable difficulty in getting the wood thoroughly ripened, if the borders are saturated with moisture. Keep Vines, from which the fruit is cut, clear of laterals, and expose the principal leaves to all the light possible. Use slight fires on dull damp days in houses where the fruit is ripe, so as to allow of giving air freely, and look over the bunches frequently, cutting out any affected berries. Late Grapes colouring must be assisted with slight fires, especially Muscats. Thrips are frequently very troublesome in late Vineries, and if these make their appearance, no time should be lost in giving the house a heavy smoking, choosing a damp close evening, and shading the Vines slightly the next morning. This repeated two or three times at intervals of about a week or ten days will effectually clear the house of this most destructive pest. PEACHES.—Give every attention to ripening the wood, for upon this being properly effected next year's success will largely depend. Keep the foliage clear of insects, and endeavour to preserve it in health as long as possible. Give air abundantly, both day and night, but keep the borders as dry as can conveniently be done, therefore do not leave the sashes down when there is a prospect of a wet night. Any gross shoots should be stopped, as these, when allowed to grow as long as they will, draw the roots and keep up a tendency to growth longer than would otherwise be the case. Loosen the surface of the inside border, in order to expose the roots as much as possible to the influence of the atmosphere; also in case of a continuance of heavy rains, cover the outside border with something to prevent its getting soaked, which would greatly retard the ripening of the wood.

FLOWER GARDEN AND SHRUBBERIES.

The earliest put-in cuttings should be potted off as soon as they are sufficiently rooted to bear the operation, placing them in a close pit or frame until they get fairly established in their pots, when they should be freely exposed to the air, in order to induce short-jointed firm growth, which, with ordinary care, will be easily carried over the winter, whereas, plants got up late in autumn in a close moist atmosphere will, despite every care and attention, be largely thinned before spring. Push forward the putting in of cuttings, and get the autumn propagation out of hand as speedily as possible. Where alterations involving the removal of large trees or shrubs are in view for this autumn, the necessary arrangements for commencing them cannot be made too soon; for although large plants may be removed successfully at almost any season of the year, it can be done more cheaply, and with less risk of failure, in September than at any other period of the year. Therefore, where such work has to be done this season, it should not, as is too frequently done, be put off until the season is so far advanced as to prevent any chance of the plants emitting fresh roots before winter. Get early-struck cuttings of Pansies, &c., planted out as soon as they are well rooted and fit for removal. Also plant out Dianthuses, Sweet Williams, and other things raised from seeds before they suffer through being crowded in the seed beds. Rose cuttings will now be readily obtained; and if planted in sandy soil, and placed in a close frame for a few weeks, and then afforded a slight bottom-heat, they will root with great certainty; especially the autumn-flowering varieties, which are vastly more desirable than those which flower but once in the season. Partially ripened, or firm short-jointed shoots should be selected for cuttings, as there is no possibility of rooting gross soft shoots.

FLORISTS' FLOWERS.

Propagate Hollyhocks. This may be done by taking buds and inserting them in light sandy soil in thumb pots. Care must be taken not to give them too much water, as they are apt to rot off, and it will be requisite to keep them closely covered down in a cold frame. Seed of Tulips may now be gathered; of course care has been taken that none but pure flowers have been saved from. The amateur may purchase good varieties at a moderately low price now; for amateurs are making up their beds, and have often surplus stock to dispose of at a reasonable rate; at all times it is advisable to give a good price for a good strain, rather than have a bad one for nothing. Carnations and Picotees should be layered; gentle waterings will be required, and the pots must be kept free from weeds. Attend to other departments as previously advised.

HARDY FRUIT AND KITCHEN GARDEN.

See that the Strawberry plants for forcing are well cared for, as nothing but proper attention in preparing the plants will ensure a good crop. Keep them regularly supplied with water, expose them fully to the sun, pinch off runners immediately they are perceived, and use every means to secure fine strong plants with bold crowns early in autumn, with which there will be no risk of failure next spring. Cover Morello Cherries with thin nets, to protect them from birds, without excluding the air; also, if not already done, net up some of the latest keeping Gooseberries, to afford a late supply. The Red Warrington is one of the best to hang late on the trees, and is also of good quality. Gather early Apples and Pears as they become ripe, and before the greater portion is blown down and injured. Tomatoes must be kept thin of wood, checking all shoots, and exposing the fruit to the action of the sun's rays as much as possible. Take advantage of dry days to earth up early Celery, sprinkling a good dusting of quicklime or soot about the plants in the lines, and over the surface of the ground for some distance on each side, to destroy slugs, which generally do considerable damage to Celery, especially in wet seasons. The soot or lime should be applied two or three times before soiling up the plants, at intervals of a few days, and early in the morning, before the pests have retired to their hiding places. Take up and dry Onions that have completed their growth. The continued wet and showery weather is exceedingly favourable to the growth of weeds, and most unfavourable to their destruction; therefore lose no favourable opportunity which a few dry days may offer to ply the hoe and rake vigorously among growing crops, or wherever weeds are becoming unsightly. Vacant ground may still be planted with winter greens, if there is any danger of a deficient supply; but as those put in now cannot be expected to attain much size, they should be planted thickly, and the ground should be well manured.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 24, 1854, as observed at the Horticultural Gardens.

August.	Moon's Age.	Barometer.		Temperature.					Wind.	Rain.

The highest temperature during the above period occurred on the 1st, 1843—therm. 85 deg.; and the lowest on the 29th, 1850—therm. 32 deg.

Notices to Correspondents.

APHIS: *J M.* With regard to your young Apple trees, on Paradise, which are annually covered with green-fly, we do not suppose that feeding the trees either more or less will render the sap less attractive to the aphis. Tobacco-water, as you observe, if strong kills the leaves; if weak it is useless. You can make sure work if you employ snuff, that is to say genuine snuff made from the Tobacco plant. Rather than be in doubt on this point, you could purchase some good strong oily Tobacco leaves; dry, pound, sift, and apply, with safety, to any kind of plant infested; but with certain destruction to the aphis. ‖

DEODARAS: *W C* would be glad to know where the Deodaras and Araucarias at the Crystal Palace grounds were purchased.

INSECTS: *Rusticus.* The insects taken from the base of your hayrick are myriads of a minute Acarus closely allied to the common cheese mite. We suppose they were attracted by the hay being put up in too damp a state. They are an exceptional case, and we would recommend that as long as they last (which we do not anticipate will be long) the hay should either not be used, or if cut, each day's supply should be steamed before it is given to the horses. *W.*

MEASURE WORK: *L.* will be greatly obliged if some of our readers will give him the prices of garden piece work, such as the market gardeners pay—digging, picking, hoeing, planting Cabbage, &c.; also the proportion of hands for glass structures per 1000 feet, whether for forcing, early Vineries, Pine stoves, &c.; and where day work is adopted, the number of hands per acre. This is a large question, but for an essay on the same subject in agriculture the Royal Agricultural Society of England awarded a prize.

MELONS: *J Miller.* We assure you we are unable to say which is the worst of the two.

NAMES OF FRUIT: *W C W.* Your Plum appears to be the Azure Hâtive.‖

NAMES OF PLANTS: *Exeroum.* 572, Campanula Biebersteiniana; 408, C. alpina? 1215, C. sibirica? specimens bad; 549, Scabiosa syriaca; 452, Pterocephalus brachiatus; 516, Cephalaria alpina; 1101, Scolopendrium vulgare; 6, Crocus Iterius; 778, Crocus nudiflorus; 777, cannot be determined; is it naked-flowered or not? at what season does it flower? 1131, it is near Caucasica, but apparently different in its roots; 514, Cephalaria syriaca var. pedunculata DC., but surely very different from C. syriaca β; 372, Scabiosa ucranica.—*G R A.* A morsel of some Niphobolus, probably N. rupestris.—*Sphinx.* Campanula rapunculoides, Potentilla collina, Linaria glaucophylla.—*B Lathom* 1, Hieracium sylvaticum; 3, Carex panicea. —*Shrewsbury Sub.* It seems to be Æthalium flavum, a great pest. Try the effect 1, of flowers of sulphur; and, failing that, 2, of clear and fresh lime-water, or caustic soda.—*W S.* Hypericum calycinum, Anemone japonica.—*C R.* Impatiens glanduligera.—*Phyllis.* Not Tway-blade, but the rare Peristylus viridis.—*W F.* A variety of Tropæolum majus. We see nothing remarkable in the Heliotrope.—*Hasodunos.* Myoporum parvifolium (white), and Tetratheca hirsuta.

OSAGE ORANGE: *F A.* You will find the information you seek respecting this plant at p. 300 of the present year's volume.

PAGE'S ANTI-BLIGHT COMPOSITION: *J R.* We cannot undertake to print any account of this. If the substance is of any value, why do not Messrs. Page & Co. send it to us for trial and report?

PEACHES: *J M.* The following will enable you to distinguish the Royal George from the Noblesse:—The flowers of the Royal George are *small;* those of the Noblesse are *large.* The fruit of the Royal George is deep red, breaking off towards the shaded side in small round dots; the Noblesse is of a duller red, marbled or blotched with dark red, but not dotted. The flesh of the Royal George is rayed with red at the stone; but that of the Noblesse is pale yellowish, white throughout.‖

PLAN OF GARDEN: *Amateur.* Such inquiries as yours cannot be answered without consideration. The plan of the flower garden is good. Look for an answer next week.

PLUMS: *J M.* Plums in pots are liable to crack if they are irregularly supplied with water. If the variety is very thin skinned, cracking may arise from too much atmospheric moisture; but it is most apt to occur when roots that have been previously rather dry suddenly receive a full supply of moisture.‖

POTATOES: *W B Jeffries.* It is a very nice Potato, with a particularly even surface, which prevents waste in peeling.

RHODODENDRONS: *Jas. Smith.* You may graft them in the spring like Apples, or in the autumn—now, if the wood is hard enough. No bottom-heat is wanted if your soil is favourable, but you will find them take all the better for being well shaded from sun till the scions have united, care being taken to expose them to air at night or whenever it is moist.

TRANSPLANTING: *M P.* It is no easy matter to move a Cedar of Lebanon, 20 feet high, with certain success. We would proceed thus:—Describe a circle round the tree the radius of which shall equal the length of the lower branches. Along this circle, and with a narrow draining spade, open a trench 2 feet deep, so as to cut through the extremities of all the roots. Then fill in the trench with any soil rich in vegetable mould, but not manured. Perform the operation immediately. By the end of October tufts of new roots will have formed in the space occupied by the trench, and the tree can be taken up without much injury. At that time, by any mechanical power at command, transplant the tree, taking great care of the new tufts of roots, and placing them evenly in the new hole. Fill earth in lightly till near the surface; then drench with water, without treading, and cover up with more earth. Secure the tree by a timber triangle.

MISC: *A Constant Reader.* We believe that the Mahogany tree exists in the hothouses at Kew.

UPPER PERUVIAN GUANO ON SALE.—Apply to W. & J. RAVENSCROFT & Co., Liverpool.

Extract from a Report of Dr. Ure, F.R.S., &c.

"Your Upper Peruvian Guano is worthy of all commendation."

Extract from the Report of George Layton, Esq.

"RAVENSCROFT'S Upper Peruvian Guano will last longer, and eventually do more good than Gibbs', or any other I have ever tried. It possesses the very finest qualities of both Guano and Bone Dust."

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.

WM. INGLIS CARNE, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodoriser and fixer of Ammoniacal matter, on Sale. Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec. Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

REAPING AND MOWING MACHINES.—CAUTION.—Notice is hereby given, that any person or persons infringing any of the Patents of Cyrus Hall M'Cormick, for Reaping and Mowing Machines, or making, or vending, or using, or exercising any Machines which in any way infringe upon any such Patents, will be proceeded against according to law. The more prominent features of M'Cormick's Patents consist in a serrated cutting blade, spear-head shaped holding fingers, and a gathering reel.

E. J. & H. LAWFORD, Mr. M'Cormick's Solicitors. Draper's Hall, 27, Throgmorton Street, London, Aug. 19.

LINSEED AND CORN CRUSHING MILLS. E. R. AND F. TURNER, St. Peter's Iron Works, Ipswich, have, during the present season, obtained the Prizes of the Royal Agricultural Society at Lincoln, the Bath and West of England Society at Bath, and the Yorkshire Agricultural Society at Ripon, for their celebrated ROLLER MILLS for Crushing Corn, Seeds, &c. These are manufactured of various sizes, particulars of which, with Illustrated Catalogue of Steam Engines, new Prize Chaff Cutter, and a variety of other Implements, manufactured by E. R. & F. TURNER, may be had free on application at the Works, Ipswich, or by Post, inclosing two postage stamps.

TWENTY-FIRST PUBLIC DRAWING. SECOND ANNIVERSARY OF THE CONSERVATIVE LAND SOCIETY.—On THURSDAY, September 7, at EXETER HALL, after the transaction of the regular business of the 8th Quarterly Meeting, at 3 o'clock, the Drawing for 100 RIGHTS OF CHOICE on the Society's Estates, will take place, and 50 SHARES will be added by seniority, the last number so placed on the order of rights by date of membership, being already 1146. Drawn shares, if in arrear at the drawing, lose their privileges. Rights may now be exercised either to select lots or estates, or to enable the holders to advances for building. Shares, 50*l.*; Monthly Payments, 8*s.* Plans of the Estates, Prospectuses, and Circulars, as to building advances, may be had of CHARLES LEWIS GRUNEISEN, Secretary.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

YEOVIL AND WEST SOMERSET POULTRY SHOW, WEDNESDAY, September 20. Entries close on September 8. On receipt of a postage stamp, a Prize List will be forwarded on application to the Secretary, at Yeovil.

JOHN GLYDE, Jun., Hon. Sec.

The Agricultural Gazette.

SATURDAY, AUGUST 26, 1854.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, August 31—Agricultural Imp. Society of Ireland.

MAXIMA AND MINIMA possess but little influence on agricultural statistics. This is true even when they relate to large fields and whole farms. Ayrshire will not stand much higher than Berwickshire or East Lothian in point of beef and mutton made per acre, because of Mr. KENNEDY'S luxuriant Italian Rye-grass, or Mr. TELFER'S enormous crop of hay; nor will Berks or Yorkshire be so very much affected in its general produce by the local failures of the Wheat reported by some of our correspondents.

Averages and totals are what the statistical inquirer deals with, and these remain almost undisturbed by individual results, however extraordinary. If this be true when such results concern whole farms, how much more so when the instances are single ears; and yet we have before us illustrations of the extremes of quality limited to single ears, which we consider worthy of discussion. For general experience, on which "averages" depend, *might* be influenced by single instances, if the lessons which such instances are capable of teaching were more prominently and generally insisted on; they would thus become as seeds from which, though insignificant themselves, results of great importance might arise.

We have before us some of the finest ears of Wheat we have ever seen—and some of the poorest; the merit is made up of several particulars—number of spikelets on the ear, productiveness of individual spikelets, and size and quality of grain; the demerit is equally compound—we have short and puny ears, long but withered ones, spikelets with abortive florets, and lean and shrivelled grains. It is worth our while to study the limits of productiveness in both directions; causes are most distinctly seen in the extreme instances of their operation, and they can often be read in single flower-stalks, and their produce, as certainly as in the general aspect of whole fields. The specimens on our table include two or three ears of red Wheat, sent to us by General ARBUTHNOT, from Northamptonshire — a few of bearded Wheat, from Lois Weedon, sent us by the Rev. S. SMITH, results of his row culture—an ear of a white Wheat from Cirencester, and some also of white Wheat from Ayrshire. General ARBUTHNOT'S specimens are astonishing—5½ inches long, with 11 spikelets on each side, each spikelet containing five large, plump, and well ripened grains, the whole yielding 110 grains, exclusive of tail corn, of which there is hardly any. Those from Ayrshire are as bad as any we have seen—not for deficiency of parts; the ears are tolerably long, there was room and place for twice as many grains upon them as they actually bear, and each grain might have bulked to twice or thrice its actual size — the appearance is that not of over crowded, and therefore small and spindled produce, but of a growth for which ample means had been provided, but only up to a certain stage, at which accordingly it stopped. Other ears could, of course, be easily exhibited whose produce was of little quantity or value, owing to other very different and, perhaps, more frequent causes.

Now between these two extremes, what are the influences whose presence or whose absence has produced this difference of produce? Some of them are within the power of man, and ought therefore to be studied by him. It is evident that General ARBUTHNOT'S plants are of a good sort; the "Bristol Red," as it is called, appears, from other specimens we have seen, to possess a good habit of growth; that, then, is one point of importance. It is evident, too, that this habit has been seconded by vigorous life during that early period in the history of the plant, when its different parts in embryo were assuming the distinctive characters of their ultimate products, for we have an ear containing a very large number of spikelets, each spikelet including a large number of florets. It is plain that the plant has not been stunted subsequently to this formation of its parts, for they have all fulfilled the purpose of their formation—none of the spikelets are abortive, each of the florets holds a ripened seed; the nourishment of the plant during its growth has been perfect, the soil in its texture has been suited to the habit of the plant, and in its composition has been able to supply its wants. The plants, too, have not been crowded, and each has had its fitting quantity of air and light. Lastly, they seem to have escaped all insect pests, and the attacks of those vegetable parasites which, however, appear to prosper chiefly when the conditions already indicated have been wanting.

They have been wanting, then, in the case of the Ayrshire specimens, for these are either partially or wholly blighted. "Up to the time of flowering, this crop looked exceedingly well and healthy; but soon the stems began to get yellow from the bottom upwards, the lower leaves withering prematurely, and a mouldy decay, in most cases, had commenced at the root." "The evil appeared in spots, which gradually extended till they nearly met." So says our correspondent; and the description of our own experience, written several years ago in this Journal, will, we have no doubt, apply to his this year:—

"The failure was owing to the appearance, after blossoming, of certain spots, on which the Wheat plants died away; these spots extended gradually all around their respective centres, attacking the several plants as they fell within the widening circle, and killing them in the different stages of growth which they had respectively attained. Adjacent spots occasionally united; in other cases, they had merely approached one another when the natural completion of the ripening process had taken place, and in others they were then still far apart. In the last cases the field presented the appearance of having experienced the influence of several detached and isolated causes of blight, at the respective centres of whose operation the work of destruction was complete; the plants, once fine blooming specimens, being there shrivelled into stunted, blackened, dead straw, with a few dusky, chaffy ears; but as one proceeded outwards from each, plants would be met with having some few shrivelled grains in each ear, until, after traversing a part of the crop in which the occasional appearance of pale dusky straw and chaff indicated the premature death of the plant, he would by-and-by arrive at the ripe and healthy crop."

Probably cases of this kind arise more from absence of the causes which produce the vigour of General ARBUTHNOT'S specimens than from the operation of any positive mischief. Vigorous vitality in the seed has probably something to do with it, and the selection of a good sort may be important on this account, as well as for the hereditary style and character of growth which it possesses. Fitness of the soil, in respect both of texture and of composition, is another essential point, affected as these are for any particular plant under the ordinary course of cultivation by the frequency with which it is grown on the same ground. The right proportioning of the seed to the surface sown is a third important point, so that each plant shall have such room for development as is best fitted for its abundant seeding, for which, as for other departments of its growth, air and sunshine are essential. The provision of all these conditions are within the reach of the cultivator; and if they were more generally attended to—if good samples of good sorts were chosen as seed, if every possible means to promote vigorous growth from the very earliest stage were adopted—if attention were paid to everything by which air and rain and sunshine being provided, the plants shall be enabled to make full use of them—then General ARBUTHNOT'S Wheat would be a commoner experience than it is, and the limits of productiveness in the case of Wheat (which none have ever seen, and few, perhaps, have ever thought of) might be rather more nearly approached than they are at present.

At present an average ear of Wheat contains perhaps 30 or 3 dozen grains. The ear from Cirencester (sort unknown) to which we have alluded has 11 florets on each side, and 4 grains in each; those from Lois Weedon (Payne's Defiance, a bearded Wheat) have 13 florets on each side, and 3 or 4, generally 4 in each; ears of the same sort of last year, contained 14 spikelets on each side, and 4 in each; the Bristol Red, sent us from Northamptonshire, contained 110 grains, 11 spikelets on each side, and 5 grains in each spikelet!* And that these are not the limits appear from a spikelet from another ear of Bristol Red before us, in which we count six perfect grains, three on each side, and the rudiments of further florets between them!!

What immense scope does this indicate for the development of our averages! They of course will grow out of improvement in individual instances, just as the experience of individual cultivators is to be improved by attention to such lessons in detail as single ears can furnish.

FOOT-ROT IN SHEEP.

[An instructive discussion on this subject took place the other day at Mr. Watkins's ram sale, at Woodfield Ombersley, in the county of Worcester. We abridge the following report of it from the *Worcester Herald*.]

Mr. WATKINS said—"I endeavoured at my last sheep sale to give some opinions I had formed on the subject of foot disease in sheep, as distinguished from the old and well known disease called foot-rot; and I then stated, and still believe, it was very little known in England till the increased imports of sheep and cattle from the continent after the reduced tariffs of 1842. I am still anxious to call attention to this particular point, in order that a remedy might be found, for I am thoroughly convinced that the sheep stock of this country has been greatly deteriorated since the time that disease appeared; and not only has the flockmaster been a considerable loser, but the public generally have been sufferers on more points than one. It is unreasonable to suppose that when a flockmaster finds this disease in his fatting stock that he puts them

* We shall feel much obliged if General ARBUTHNOT will kindly give us the history of the field from which the ears were gathered—when its produce is known.

on one side till a cure is effected. The butcher cares not for a defect so little perceptible to his customers, and by which he loses nothing, or probably gains by the infusion of blood in the inflamed limb; even in bad cases he is enabled to procure a fair price for an unsightly joint from the manufacturers of soups, sausages, &c. And at any rate, it is offensive to suppose we are consuming under any form the meat of an animal slaughtered in a state of inflammatory disease. The foot disease is known to exist in all the richest farming and grazing districts of the country, but the mountain sheep of Wales and Scotland appear to be exempt, and as foreign sheep have not been introduced into those parts, this adds to the probability that it is an imported disease. And I am led to this conclusion from constantly seeing foreign sheep in the districts round London that have been purchased in Smithfield market in a deplorably diseased state. I have often talked to men I have seen dressing them, and I have invariably heard the same remarks from them, that the sheep stock of the country will never be healthy again, as long as diseased sheep are imported and allowed to be driven to our markets; for as soon as one lot is cured or slaughtered fresh ones are purchased, which infect the whole district again. Surely it must be desirable, if not for the health of the public, yet for the sake of economy, that some extraordinary means should be adopted to remedy so great an evil; for it is useless to suggest measures for its cure so long as the disease is allowed to be imported; and it is most desirable that inspectors of stock should be appointed, under very stringent regulations, at every port, to watch the disembarkation of stock, with power to order all ships containing diseased sheep or cattle from our shores.

Mr. G. Whittaker said that to get anything done by the legislature, those who complained of the importation of infected animals must make out a good case. They did not doubt that the disease was imported, but how were they to prove it? No foreign sheep had ever reached the Ombersley district, still the disease had come here to some considerable extent. But they must remember that during the last eight or ten years there had been blights and various diseases such as had never been heard of before.

Mr. Watkins said he was now residing principally within 20 miles of London, and was riding continually about in various directions. He had never yet seen a single flock of imported sheep but what had been more or less diseased. The merinos, which had been largely imported, were the most subject to the disease; and he had seen them huddled together like pigs, and unwilling to stir until they were threshed up with the sheep hook.

Mr. Curtler intimated that the Royal Agricultural Society had already taken up the subject, and that, in his opinion, if the Council of the Society thought they could move the Government to do any hing beneficial they would do so; therefore it struck him that the interference of the local societies would not be attended with much good. He agreed with Mr. Whittaker that the strongest proof would be required before the Government would do anything by which the importation of foreign stock would be prohibited, or put under such restrictions as would amount to a prohibition. Mr. Watkins had shown that the sheep on the mountains of Wales and Scotland had been found to be free from this disease. Last year he (Mr. Curtler) saw thousands and thousands of such sheep on Salisbury Plain, and asked the shepherds there questions upon the subject of this disease, and he did not meet with a single shepherd who had it in his flock. It struck him that it was questionable whether the disease was imported. Where pastures were much elevated, and the herbage short, fine, and dry, there was no disease; and so far as his experience went, there was most disease where the pastures were the richest. It was incontestable they had got disease among the sheep in this district, and without the presence of foreign sheep it still broke out again. He observed that last year in the wet season it was very prevalent, but on the disappearance of the wet the disease in a great measure disappeared. In his own flock of 500 or 600 sheep the disease had entirely disappeared, and for months not a single sheep or lamb had had anything the matter with it in the foot. Last year he had not a single ewe, or indeed a single sheep, that was not diseased several times over. No foreign sheep had been near his flock. His plan to get rid of the disease had been to see his flock dressed every day, and often twice a day. He believed he should not have got rid of it without, because every sheep took a long time in dressing; and a great deal of patience and attention were required, as well as much cutting, because, unless every particle of disease, up to the very coronet itself, were removed, and the foot dressed with care, the disease would break out again. He did not think all the efforts of the agricultural societies would induce the Government to interfere, and his advice was, that every man should use his best endeavours to get rid of the disease in his own flock.

Mr. Watkins doubted whether Mr. Curtler and he were alluding to the same disorder. There were three distinct diseases of the feet of sheep. One was the old-fashioned foot-rot, now prevalent about this neighbourhood, which everybody knew by the peculiar appearance and smell of the foot. Then there was another disorder, which became prevalent when he was a young man, which people in the neighbourhood of Kidderminster called "wildfire," in order to distinguish it from the foot-rot. It came on with a violent swelling at the ankle and often at the fetlock joint; matter would form in a large abscess, the sheep very often rubbed its nose or its eye against its foot, and those parts became inoculated, and the sheep was in consequence badly disfigured about the face. Sometimes the sheep would get inoculated on the breast, where there was a little bareness from lying down, and then abscesses would form about the body. But this was not the disease to which he wished to direct their attention. The disease he meant was not known in this country before 1843 or 1844, when it spread rapidly across the country, taking a flock here and there and missing others. The sheep appeared to be palsied when taken with it. He at first fancied his sheep had a complaint in the back or spine, they seemed to have so little power about the legs. It turned out to be a disease in the coronet and round the hoofs. As he said last year, he believed that when the disease appeared the best plan was to puncture the coronet, put a seton in, and drive away the virulent matter before it penetrated between the sensitive part of the foot and the hoof, and caused separation. He still believed the disease was imported, because it was talked of by the old German writers centuries ago, and had not been written of in this country, and moreover first made its appearance on the introduction of the new tariff. Where the sheep had been injured by this disease the old-fashioned foot-rot was sure to follow, but that was very easily cured; if not, it was from the ignorance of the shepherd.—Mr. G. Whittaker mentioned, as a remedy, pyroligneous acid, in which as much blue and white vitriol as possible is dissolved, and then mixed with Armenian bole, in order to make it stick to the sheep's foot. Butter of antimony, which was an old-fashioned remedy, was too strong.

AGRICULTURAL CHEMISTRY.

ROYAL AGRICULTURAL COLLEGE.—SESSIONAL EXAMINATION. JUNE, 1854.

2. Give a general characteristic of organic substances.
3. Explain the terms putrefaction, decay, fermentation.
4. What is the most probable constitution of fatty substances?
5. Mention the distinguishing properties of albumen, casein, fibrin, legumin, gluten.
6. Describe the most approved modes of preserving organic matters from entering into decay or putrefaction: and explain the chemistry of the various processes you describe.

[Answers by Mr. H. Chancellor.]

2. The following would represent the general characteristics of organic substances:—1st, They are all combustible, *i. e*, burn away, mostly with the simultaneous deposition of black carbon. 2d, Consequently all contain carbon (the characteristic element), and that combined at least with one or more elements, with hydrogen, in some oils, or with hydrogen and oxygen, in starch; and with hydrogen, oxygen, and nitrogen in protein, and then with the addition of sulphur and potash in leguminous seeds, &c. 3d, They are of a very complex character, and give rise to a great variety of fresh products of oxidation; humus, for instance, becomes converted into humic, ulmic, geic, crenic, and aprocrenic acids. 4th, The uniting number of their equivalents is very high, as margaric acid, in which 64 equivalents of carbon, 68 of hydrogen, and 8 of oxygen are contained. 5th, They have a peculiar arrangement, and cannot be divided into binary and ternary compounds, &c., having electrical opposition. 6th, As a rule this cannot be obtained artificially, though this has one or two exceptions.

3. The terms *Putrefaction*, *Decay*, and *Fermentation*.

Putrefaction may be considered as a spontaneous variety of decomposition of an organic substance, the products of which are very numerous, thus differing from the other variety of true spontaneous fermentation. Among putrefactive processes may be reckoned the lactic acid fermentation — a variety to which all feeding and azotised substances are particularly liable, during which lactic acid is produced, which rapidly increases the already putrifying mass. The more common products of putrefaction, or rather lactic acid fermentation, are—sulphuretted and phosphuretted hydrogen, hydro-sulphate of ammonia, carbonate of ammonia, and many such like. Owing to the great variety of products resulting from the putrefaction of an organic substance, the odour given off is particularly disagreeable; the sour smell is due to the lactic acid. The variety termed lactic acid fermentation proceeds under an elevated temperature from 70° to 100°, while below this the acetic acid fermentation sets up.

Decay is a slow oxidation of an organic substance, the whole being eventually dissipated in the form of carbonic acid gas. This is well seen in the case of decayed trees, where the material is gradually wasted away. *Peat or humus*, which consists of several acids, already mentioned, is an intermediate state of decay, which is still continuing, and carbonic acid gas is evolved, till ultimately the whole of the organic matter is in this way dissipated. It is, in short, a slow oxidation of the organic matters.

Fermentation is properly of but one variety, that known as the vinous fermentation. Lactic acid and acetic acid fermentation cannot be called true sorts of fermentation. It is a spontaneous decomposition of an organic substance, the products of which consist entirely of carbonic acid and alcohol; in fact it is the breaking up of the elements of sugar, and their reconstruction in the form of carbonic acid and alcohol.

4. As to constitution of fatty substances. Fatty substances seem to consist of three essential constituents, which are present, for the most part, in different proportions in different varieties of fats. They are margarine, stearine, and oleine; and it is to the partial absence or preponderance of one or another of these that the great differences of fats are due; those, then, containing much stearine are of a much more solid composition, as is the case with lard and the hard internal fat of the animal structure, while those preponderating in oleine are of a more liquid character; and in cases where margarine abounds intermediate proportions are present. Margarine, stearine, and oleine are, as it were, salts of glycerine—compounds of acid with glycerine; and hence, by the addition of a strong alkali, the composition is broken up, and soaps are formed; and by after adding a strong mineral acid, the peculiar acids are obtained pure, the acid uniting with the base used, as potash or soda.

5. The following would represent, in a measure, the distinguishing properties of the following protein compounds.

Albumen is easily distinguished from either of the following by its coagulating on boiling. It is precipitated by acetic acid, but when in a coagulated state is dissolved by acetic acid. It contains sulphur, and of course all the general characters of protein compounds.

Caseine is likewise precipitated by acetic acid, and is soluble in alkalies; is distinguished easily by its forming a curd in boiling, which is a peculiar characteristic; does not, like albumen, coagulate on boiling.

Fibrine is readily distinguished by its perfect insolubility in water, it has all the peculiar characteristic feel of muscle; like caseine, is precipitated by acetic acid and is soluble in alkalies.

Legumin, a peculiar protein compound, so termed as occurring in all leguminous plants, particularly the seeds, and is in fact the vegetable caseine. It is also distinguished by its forming a curd on boiling, and from albumen by not coagulating on boiling, but is precipitated by acetic acid, soluble in alkalies, rich in sulphur and phosphorus.

Gluten, or vegetable fibrine, distinguished by its perfect insolubility in water, and having the peculiar feel of muscle, and is very sticky.

Besides the peculiar properties I have mentioned, they all contain of course the general properties of protein compounds, as being highly nitrogenised, containing sulphur and phosphorus, or both, being easily soluble in potash, &c.

6. The means in use for preserving organic matters from entering into decay or putrefaction, are chiefly the following, depending on the three principles. *A*, Antiseptic properties and removal of ferment; *B*, the exclusion of air; and *C*, surrounding the organic matters with an atmosphere of nitrogen or carbonic acid, and thus preventing decomposition.

In the first place, as antiseptics, there are a great many for particular uses, as sugar, salt, spices due to volatile oils, &c., which are used chiefly in the preservation of fruits, vegetables, and meats. Also, creosote obtained from the dry distillation of wood has very powerful antiseptic properties, and it is to the agency of creosote that the smoking of hams is due, and the preserving power of tar which contains much creosote. Creosote is used also for the preservation of timber to some small degree, and can stand great dilution. It is a common and good plan, in the place of smoking, to add a drop or two of creosote to the brine of the ham. Charcoal has great antiseptic properties; hence, why game will keep so well in powdered charcoal, and water keep free in charred vessels; also, why timber placed underground is so materially preserved by being charred previously. Besides the more common antiseptics, there are others, as metallic oxides, the agency of which is due to their forming insoluble compounds with the protein compounds in the timber; and thus prevent their setting up decomposition. These are much used in preserving timber, for which purpose they are very useful. Among many others, the bichloride of mercury, or corrosive sublimate, is very useful; but, as being expensive, cannot be economically used in the case of timber: it consists in impregnating the outer exposed portion of the timber, &c., and is termed Kyanising; the mercury forms an insoluble compound, and thus the timber is preserved. There are others, as the acetates of iron and copper and the chloride of iron, which, as being much cheaper, are better adapted for this purpose. Besides the antiseptic agents, the removal of the albuminous or fermenting principle by washing it out, as carried out in the preparation of Flax, either by the slow process of placing bundles in running water or in pits, or by the quick process of boiling or hot water and steam, or by the immediate destruction of the albuminous matter by the agency of potash [1 of potash, 400 of water], which leaves the cellulose perfectly untouched; the potash is afterwards removed by an acid, &c. This washing out of the albuminous materials is also seen in the preparation of timber by soaking it in water, when the protein compounds are removed, and the water entering the cells has an additional antiseptic effect.

The second means, by the exclusion of air, is also much carried out in preserving pickles and fruits and meats of all descriptions.

By placing the organic substance in a tin canister which has an opening, and heating this in a water bath, or so elevate the temperature as to expand the air, and cause it to be expelled at the opening; the opening is then immediately soldered up, and consequently but little fermentation can proceed.

The third mode consists in the surrounding of the organic substance with carbonic acid or nitrogen, or such like gas—as by placing at the bottom of the vessel some protosulphate of iron and lime in a moist state, and covering the jar air-tight, when the oxygen of the confined air is taken up by the iron, which is peroxidized, and the lime is taken up by the sulphuric acid, forming gypsum—which itself materially assists in absorbing water.

FINGER AND TOE IN ROOT CROPS.

By James Buckman, F.G.S., F.L.S.

(*Continued from p.* 538.)

In the spring of 1849 the reserved roots were taken out of the ground with a view to transplantation, for which purpose only the best were put aside; these were rather more fleshy than those just noted, and, though forked, yet the ones less so than others were replanted for seed.

Late in the summer of 1849 the seed was collected, and a patch of it sown in a different part of the garden in the spring of 1850, the result of the second sowing being that the leaves in all indicated the advance to the cultivated form. Some specimens, however, were much finer than others; and in the autumn of that year some examples were taken up for illustration in the lecture room, when it was remarked that those which had been so chosen were of a good size and of tolerably smooth outline, and, in short, showed a disposition to become "respectable roots" (see drawing 6). Of this crop the best roots were reserved for seed and treated as before, the seed of 1851 being planted once more in a different portion of the garden. The result of the roots of 1852, however, showed how futile was the attempt to carry on an advance under the same circumstances, ofttimes repeated, of soil, situation, climate, and mode of cultivation, inasmuch as the whole crop evinced a disposition to retrograde rather than advance; the plants had a wilder aspect, and the roots reverted to the form of the first year's cultivation, instead of improving upon the second. However, this year the seed has been saved, not with a view of continuing these experiments in the college garden, but in places where all the circumstances are as distinct from those under which the seed was grown as possible.

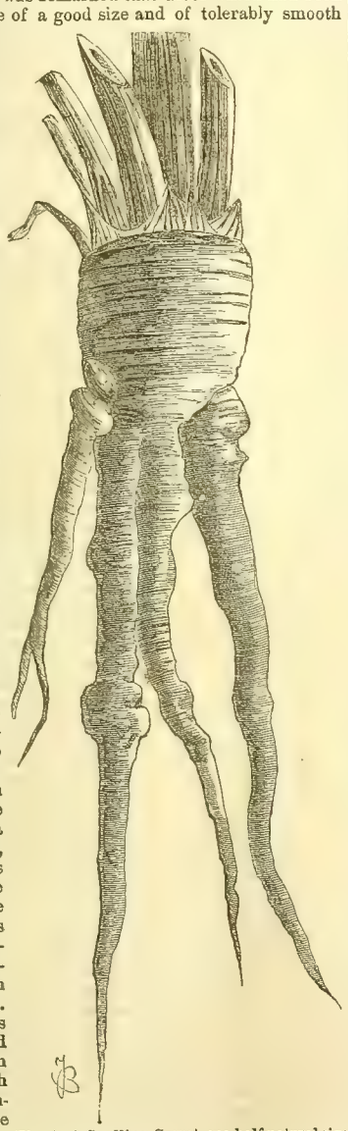

Fig. 4. A Seedling Carrot, one-half natural size.

Now, in order to render these experiments with the utmost clearness, I have here repeated their results in the tabular form, and shall again refer to them in the explanation which will follow.

Result of Experiments in the Growth of Wild Parsnips (Pastinaca sativa):—

First Crop.

1848. Spring—wild seed sown ... Some of the plants had smoother leaves, of a light green colour. [forked.
Autumn—roots examined ... Their tissues increased, much
1849. Roots cultivated for seed.
Summer—seed gathered.

Second Crop.

1850. Spring—seed of 1849 sown ... All the plants free from hairs.
Autumn—roots examined ... Larger, and not so much forked.
1851. Roots cultivated for seed ... The plants presenting the stems and foliage of cultivated examples.
Summer—seed gathered.

Third Crop.

1852. Spring—seed of 1851 sown } No advance in any stage upon
Autumn—roots examined } the second crop; but, if anything, a disposition to retrograde.
1853. Roots cultivated for seed }
Summer—seed saved ... }

As respects the Carrots, which were cultivated in the same manner, it may be remarked that the change effected in them was not near so great as that observed in the Parsnip. Of the first crop all the specimens manifested a disposition to send up several heads from the crown and most of them ran to seed, the roots were much forked, and but little inclined to increase tissue; however, the most likely ones were reserved for future growth, and, as in the Parsnips, the second crop was certainly improved, the crowns of many displayed but one bud, and the roots, though still forked, became more succulent and enlarged; the third year's growth, however, like that of the Parsnip, was a reversion to the wild state. Still the progress with the Carrot as well as the Parsnip was quite sufficient to show that it is within any one's power to renew both of these plants in a cultivated form from wild specimens by acting in conformity with the physiology of their growth; in short, as will presently be shown, not by growing them in soil suitable for them as wild plants, but by constantly surrounding them with circumstances as totally opposite as possible.

But besides this, these experiments seemed to point out the way to a solution of the mystery of finger and toe in root crops, to which the Parsnips and Carrots of our garden culture have always been peculiarly liable. The time and mode of sowing the seed would naturally tend to an enlargement of the roots in the best examples of the resulting crop, inasmuch as spring sowing induces a more determinate biennial character; and as the roots of the wild plants are always more or less branched, it is but reasonable to suppose that the ramifications as well as the main root would equally put on cellular tissue in the majority of examples; and it is only by putting aside the cleanest roots for seeding—indeed, taking care to get your seed from plants which possess the qualities you require to the greatest possible extent—that you are at all likely to be successful either in ameliorating wild plants or in getting pure stock from acknowledged cultivated varieties.

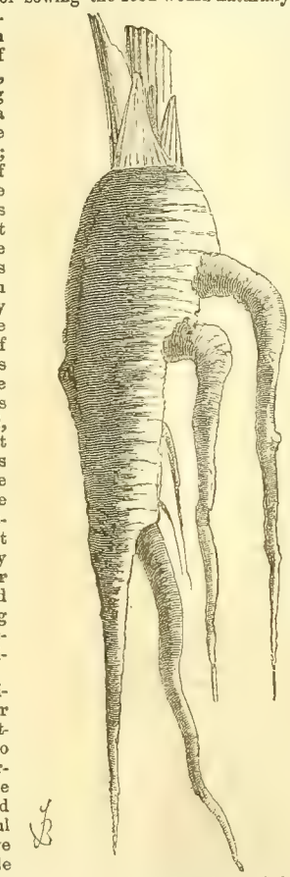

Fig. 5. A Seedling Parsnip, one-half natural size.

A tap-root (fusiform) with a clear and unbranched outline is not natural to the Parsnip or Carrot, but can only be attained from wild plants by careful cultivation. May we not then conclude that the branching in cultivated roots (finger and toe) results from a reversion of these to a greater or less extent to their original wild form? In other words, inasmuch as in the passage from the wild to the cultivated state the branching of the roots becomes more conspicuous, may we not therefore conclude that, as finger and toe is a mark of cultivation in wild plants, so this deformity in cultivated plants is an evidence of reversion to wildness? These remarks, then, tend to show that the question is one entirely belonging to the inquirer into vegetable physiology; and it is, therefore, no wonder that chemical analysis, either of soils or crops, should have done nothing towards its elucidation.*

2d. *Notes on the Natural History of Root Crops in Cultivation.*—In considering my second position, namely, the confirmation of my theory of the cause of finger and toe from observed facts in reference to cultivated crops, it will be well to state that, having as I thought become experimentally acquainted with the nature and cause of the distortion during the progress of growth of wild plants, I set to work diligently to inquire into the circumstances of the mischief as it affects cultivated crops; and both from observation and inquiry I arrived at the following general conclusions, which I shall state and comment upon *seriatim*.

Finger and toe will always be found to a greater or less extent in every field of Roots, whether of Parsnip, Carrots, or Turnips.—Now, if we consider that these, as crops, are at all times derivative—that is, that they are altered states of original wild examples from which they sprang—and that the change from the wild state produces not only one form but several, which we term varieties, and that these sorts are only to be maintained by a rigid adherence to the circumstances which produced them, we must ever expect a tendency to some change; so that, though the mass may be maintained in tolerable purity, others will show a disposition to revert to the posit on from which they sprang, as varieties can never be absolutely permanent. In this case, then, finger and toe marks degeneracy.

Finger and toe will always prevail where the crop is derived from seed brought from a rich to a poor soil.—Cultivation of roots presupposes that manure has been employed, the result of which is to cause a great increase in cellular tissue or succulency; hence then, as rich soil is an element in advance, so poverty of land is equally a reason for retrogression; it is, then, no wonder that, as a general rule, there should be found more malformed roots in a poor than in a rich soil.

The deformity is likely to result where seed has been grown in the district in which it is sown for the crop.—In cultivating wild specimens our experiments showed clearly that constant growth, under the same circumstances of seed and place, tends to degeneracy; and this is a matter fully proved by the experience of every one with every kind of crop: hence few venture to repeat the sowing of their own seed-corn to any considerable extent. On this subject a case has come before my own observation during the last two years, which may not be without interest in our present inquiry. A poor man in my own district cultivated a patch of White Globe Turnips for seed, and in the summer of 1852 he got so good a crop of seed as to induce him, on clearing off the first crop, immediately to try a second in the same ground. During the past summer, 1853, he again got seed, but much less in quantity, as the roots were all diseased. Now, as I constantly watched this piece of about a quarter of an acre, I am enabled to say that finger and toe was very prevalent throughout the whole patch, whilst many roots had a tendency to decay, so that the flower-stalks dropped away for want of support. I have had no further opportunity of tracing this seed, but nothing can be clearer than that the second year's growth had degenerated from that of the first; and if, as is very probable, the seed be used again in the district in a similar soil, one cannot wonder at an unsatisfactory result.

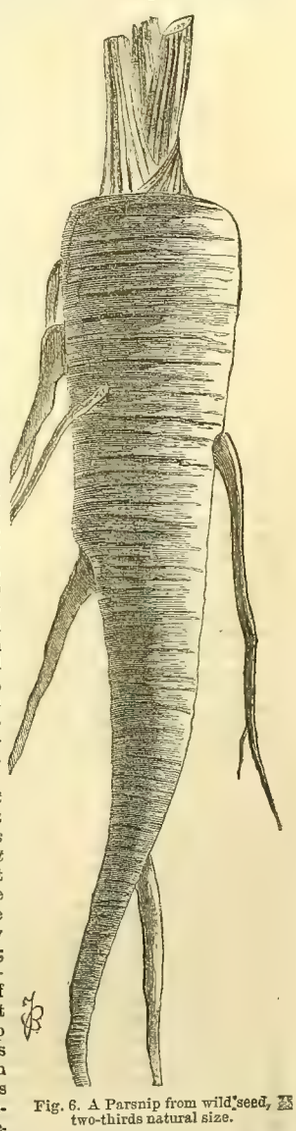

Fig. 6. A Parsnip from wild seed, two-thirds natural size.

Degeneracy must always result where a whole patch or field is indiscriminately put by for seed.—Amongst every crop there are sure to be some examples unworthy of being progenitors; and as, with the continued cultivation of any sort, the constant want of keeping up those circumstances of care and attention by which original sorts may be produced necessarily ends in degeneracy, it is no wonder that any kind which has for a long time been a favourite in a particular district should ultimately lose caste. For seeding, the best examples should always be chosen, and these should be transplanted, for it is by these processes of culture that the impress of cultivation can be maintained. And again, this transplantation should in all cases be as far from other patches of the same tribe as possible, in order to prevent the influence of hybridism. *Journal of the Agricultural Society of England.*

(*To be concluded next week.*)

* In confirmation of this see a Paper in the Transactions of the Highland and Agricultural Society of Scotland for October, 1853.

Home Correspondence.

Harvest at Brough, Yorkshire, Aug. 23, 1854.—Wheat: Good average, and likely to be a good sample; harvest now pretty general. Barley: Bulky; above average; sample promising to be small. Oats: Considerably under average. Green crops: Looking well, but much finger and toe prevails. Potatoes: Looked promising to a late period; but now disease is fast appearing. The above in my opinion is a correct outline of the present state of the crops within an area of ten miles from this locality. *P. Deane.*

Drainage and Land Improvement Companies.—The agricultural community have to thank you for your remarks on the Drainage Bill of this session, which was rejected by the House of Lords upon the most futile and insufficient grounds. So long as the Corn-laws existed, the question of agricultural improvements, either permanent or temporary, was not much mooted, because the duty operated as a premium upon the growth of grain to the exclusion of foreign articles. On

the withdrawal of the Parliamentary bounties, and with a view of meeting the difficulties of the farmer's position, and of improving the natural resources of the country, a bill for the improvement of agricultural tenant right in England and Wales was proposed and brought in by Mr. Pusey, and the report of the select committee of the House of Lords for inquiring into the expediency of charging entailed estates with the expense of drainage and permanent improvements caused much attention, and 3 and 4 Vict., ch. 55., was passed enabling the owner of settled estates to defray the expense of draining the same by way of mortgage, to be paid off by instalments. This I remember at the time was thought rather piece-meal legislation, and the act 9 and 10 Vict., ch. 101, was introduced authorising the advance of public money to a limited amount, to promote the improvement of land in Great Britain and Ireland by works of drainage, and this act was subsequently enlarged and amended by the 10 and 11 Vict., ch. 11. I need not, I am sure, trouble your readers with all the ramifications of the 12 and 13 Vict., ch. 100, and the 13 and 14th Vict., ch. 31; private money drainage acts, or the Farm Buildings Acts, which extend the provisions of the Drainage of Land Acts, and give powers for the advance of private money for the erection and repair of farm buildings on land in Great Britain and Ireland. I think I have stated enough to show that so much having been done by legislative enactment for the landed interest, the indignant remonstrances of Lords Portman and Redesdale might have been spared on the Drainage Bill, after passing through the Commons, with considerable discussion on its provisions. We know from the reports in the different journals, that the river Nene, on its frequent swellings, often overflowed 10,000 or 15,000 acres between Northampton and Peterborough before it entered the Fens; the Ouse probably damages a greater extent, and the Welland and other Fen rivers inundate in a similar manner, and they all have bad and inefficient outfalls, and which were imperfectly provided for by Lord Lincoln's Act, 10th and 11th Vict. I therefore agree with you that great credit is due to Mr. Ker Seymer, who is a most energetic and enterprising landlord, to attempt by his bill to give greater facilities of outfall; and it has often struck me that the powers of these Drainage and Land Improvement Companies are exceedingly apt and opportune in the present improved condition of agriculture, as they are now doing what the Government ought to have done upon the issuing of the report of the "Agricultural Customs Committee" of 1848, and it would save a vast amount of trouble and litigation if the improvements, particularly in the West of England (so much recommended by the *Times* commissioner) were carried out by these companies, instead of being executed piece-meal, as they now often are, by heavily incumbered landlords, or by tenants on commission under the now fashionable tenant-right agreements which are fast superseding leases. *E. B. Acton.*

Farmers' Clubs.

HADLEIGH.—*The Construction and Arrangement of Agricultural Buildings.*—Mr. Cook, of Holton Hall, recently delivered a lecture on this subject, before this club, from which we make the following extracts:—My landlords having last spring determined to erect entirely new buildings upon Holton Hall Farm, it was left to me in a great measure to suggest and arrange the plan on which they should be constructed. I have therefore inspected many farm homestalls in this and other counties, and I have availed myself of the opinions of several sound practical farmers and others connected with the management of landed property. I find there is a decided preponderance among these authorities in favour of covered homestalls; and I entirely coincide in their views. I will proceed shortly to furnish you with the advantages which I contemplate from its use. First, the greater facility for fatting cattle, and economy in their food. We are all aware that economy in this department of our business is much needed; for the process of yard-fatting, under the old system, is very generally attended with a serious loss to the grazier, and but seldom with a profit. I cannot but think that by the erection of lofty and well-ventilated buildings, thus ensuring a tolerably equal temperature and less exposure to vicissitudes of climate, the animals so treated must fatten faster and at a less cost. I am certain they require less food, and that there is much less waste than in an open yard. I assume also that the cattle so treated will be less liable to disease; and this, at the present time, is a great matter for consideration, as so much sickness and loss of life has prevailed in this locality. That these advantages are to be obtained I have great confidence; and if a saving of only 20*l.* or 30*l.* a year is effected under this head, upon a farm of 400 acres, it is an important item in the balance-sheet. Next, I will take your attention to the increased value of manure made under cover, and the saving which is contemplated in its application to the land. There can, in my opinion, be no question but that manure made under cover is far more valuable than that made in an open yard; and I wish to put a fair and reasonable estimate upon this item. I assume that on a farm of 400 acres (chiefly arable and in a fair state of cultivation) at least 300 loads are made in a year; and it surely is not putting too high an estimate to assume that manure so made is worth 1*s.* per load more than common farm-yard muck; if so, a further saving of 40*l.* a-year is effected; but in order to keep quite within the mark, I will call this 25*l.* per annum, and add to this the further saving which takes place in labour. As the manure thus made is fit for use from the yard, the additional filling, stirring over hills, and preparing earth bottoms is unnecessary. I had a conversation with a gentleman who farms largely near Chelmsford, a short time since, and he has had time to test the advantages we are discussing, and he assured me that his saving under this head is not less than 40*l.* or 50*l.* a-year upon 700 acres. Reducing this in proportion to 400 acres, gives about 25*l.* Formerly the plan pursued was to keep what are called straw-yard beasts fed principally on straw; but experience has taught us that even with the prospect of little or no profit on animals, the farmer must keep a larger quantity of stock, and feed it better, for the sake of improving his manure. The consequence is, that a larger quantity of corn and cake is consumed, and a heavy outlay is thus created. Generally speaking, but little care is bestowed upon the manure so expensively made; and, fortunately, this care is not needed in the covered homestall. There is no surplus moisture; no tanks are required. The straw takes up all the liquid manure, and holds it: thus the quality is retained, and a much less quantity is requisite per acre than of the common farm-yard muck; and by using it direct from the yards no waste ensues from unchecked fermentation. Thirdly, I will call your attention to the "general convenience" and the variety of uses to which a covered homestall may be applied, and to the comparative ease of the farmer in his superintendence. I have already noticed the health of cattle; their aptitude to fatten; and the economy of food: to these I would add their adaptation to summer-grazing. I feel confident that if the buildings are properly constructed, with a sufficiency of height and good ventilation, the cattle will not be incommoded with flies, and that green food may be used during the summer months to advantage. The yards are also more easily subdivided, and a greater amount of accommodation can be obtained than on any other system. Next, their uses in a fickle hay-time and harvest, for securing the loaded waggons from the weather, is, to say the least of it, a great convenience; and if the health of cattle is secured, a less outlay will be required for the veterinary surgeon. I am, perhaps, to a certain extent antiquated in my notions—or, at any rate, I shall be thought so by some for not having enumerated amongst the advantages that of spline-feeding. [Feeding on open boarded floors is, we presume, here meant.] I confess I am not friendly to this discipline. I have had several opportunities of seeing cattle fed upon this plan; but so far as I am able to judge from a short and casual examination, I do not put much faith in the results, and I doubt very much whether they will fatten as fast as they would do in a comfortable covered yard, on an easy bed of dry straw; but if they will, the object which most farmers have in view is defeated, viz., that of converting their straw into manure. I had an opportunity of seeing this system carried out in July last, in some low, badly-constructed boxes; the effluvia from them was most offensive; the poor brutes were punished dreadfully by flies, which were congregated in thousands, and they seemed to me to have just about as much comfort as a fellow on the tread-wheel, and about as likely to get fat. But assuming that all my prejudices against this system may hereafter be dispelled by the greater lights that now rule the day, and that the Mechi and Huxtable plan is the preferable one, then the covered homestall will become doubly valuable on account of the adaptation of the yards for carrying out the spline process. I hope you will pardon the digression in which I have indulged in this division of the subject. I am aware also that there are others whose ideas of progress in other particulars far exceed my own. Some are for dispensing altogether with stables; others with barns; but it will be seen by reference to the plans on the table that I have availed myself of the use of both these old-fashioned appendages. Where stables are dispensed with, boxes generally are used; and this is done to a great extent in some counties. These often are low and much too confined for working horses; and I confess I am unable to detect any advantage over the covered yard either in utility or expense. Others are substituting a circular horse-truck or threshing-room for the barn. I can see no particular advantage in this; if there is any at all, it is in the less cost of erection, and even this is doubtful, for I know of instances, where this plan has been carried out, that it has been necessary afterwards to build open or Dutch barns near. I come therefore to the conclusion that on a large farm the barn is indispensable; and it affords an opportunity for the employment of labourers in the winter months, when often other employment cannot be found; and I still think that a constant and uniform supply of soft corn, straw, and chaff during this period of the year is very desirable, and these cannot be had without barn-room. In the early part of the evening I stated that I had relied more on the opinions of those I had consulted, on account of their long experience in these matters, than on my own; and amongst others I have been favoured with that of Mr. Baker, of Writtle, who is known to most of you. In a letter just received from him he says:—"I some years since wrote an essay for the Royal Agricultural Society on this subject, and I supplied them with plans, &c., for farm premises; but I confess, however, my views are materially changed since that time. Covered yards I now see are best for fatting purposes, but young stock perhaps do as well in open sheds." I have also reasons for knowing that in these views Mr. Beadel, of Chelmsford, entirely concurs, and he has had great experience in his capacity of land-agent, and he has also a covered homestall in use for his own purposes. I will now furnish you with the opinions of a very eminent agriculturist in Essex, who has had five years' use of a covered homestall:—

How long have you used a covered homestall? Five years.—Do you find the dung made in it fit for immediate use? Yes.—Is there any drainage so as to render tanks necessary? No.—Is there any unpleasant smell during the time it is making? No.—Is there more or less straw required for littering the cattle? About the same.—Are the cattle warmer and more protected than in open yards? Yes.—Do they appear to you to fatten quicker on that account? Yes.—Is the consumption of food less? I think it is.—Is the quality of the dung better? A vast deal.—Do you generally use a less quantity per acre? Yes; one-third less, with better effect.—Do you consider the homestall useful for cattle during summer? As much so as in winter.—Do you, from experience, approve of the covered homestalls; and can you recommend them? I should like to have them on all my occupations, and I recommend them most strongly.—State any objection your use of them may suggest. I know of none.—Are they useful for the temporary protection of hay and corn during a fickle harvest? Decidedly so.—Your opinion as to the comparative money value of the dung made in the covered homestall, as compared with that made in open yards? Nearly double.

Having now enumerated the principal advantages contemplated by the uses of the covered homestall, and the opinions of several gentlemen respecting them, I will now lay before you the results as I estimate them:—

Fatting cattle, and economy in food	...	...	...	£25
Additional value of manure	...	...	...	25
Diminution of expense in labour	...	...	...	25
Summer grazing and minor uses	...	...	...	15
				£90

Say, in round figures, 100*l.* a-year upon 400 acres. This surely is an important item in the year's account, and I do confidently hope and believe that this will be realised by a fair trial.

Reviews.

Profitable Poultry, by W. B. Tegetmeier. Darton & Co., Holborn Hill.

A PAMPHLET containing simple descriptions and instructions such as the poultry keeper needs. The object is purely practical—its aim is to place in the hands of persons who have not had much experience a book which should contain all that is most essential to be known respecting the housing, feeding, breeding, and treatment of fowls; and to this has been added such information as the experience of the author has enabled him to give respecting the most profitable varieties viewed as agricultural stock. So the author states in his preface, and as he has fairly hit the mark at which he "aimed," we may adopt as our own the terms in which he describes his work. The following extract on the hatching and feeding of chickens, will serve as a specimen of the work:—

"I am aware that these recommendations to leave natural operations to nature are contrary to what are frequently found in books, but I am merely writing the results of my own experience, and I have always found the more the hatching hens are meddled with, the worse the result. It is a notorious fact that when a hen steals a nest in some copse or place where she can remain unmolested, she almost invariably brings forth a more numerous and stronger brood than when she sits in the hen-house.

"The chickens require neither food nor drink on the day on which they are hatched; in fact, *both are injurious*, as they interfere with the natural digestion of the yolk, which is absorbed into the bowels at the period of hatching, and constitutes the first food. If grits, oatmeal, &c., are spread before the hen on the twenty-first day, she is induced to leave the nest, and the last hatched chickens, which are perhaps not yet dried, are unable to follow, and being weakly, perish; or unhatched eggs may be left.

"If undisturbed, the hen seldom leaves the nest on the twenty-first day, and on the twenty-second the chicken will be found strong enough to follow her, and any unhatched eggs may be destroyed, for those chickens that are not then able to follow her will seldom be found to repay the trouble that may be taken with them. The plan of cramming peppercorns and other spices down the throats of chickens is cruel in the extreme, and, moreover, exceedingly injurious. I have found the best food to be two-thirds sweet coarse Oatmeal and one-third Barley-meal, mixed into a crumbly paste with water; this is very much relished, and the chickens make surprising progress upon it, they are also very fond of a little cold oatmeal porridge, and by way of variety I sometimes give them a few scalded grits, dusted over with a little barley-meal, to cause them to separate.

"Milk is frequently used to mix the Barley or Oatmeal, but from the extent to which it is then exposed to the air it soon becomes sour in summer, and is decidedly injurious if employed in that state; no more food, therefore, should be mixed with milk than can be eaten in a couple of hours. Sopped bread is by no means desirable, the chickens become weakly and affected with diarrhœa from its use; in fact it has not that degree of solidity which is requisite to afford an opportunity for the exercise of the natural grinding action of the gizzard. A little chopped Onion, or, still better, some finely shred green Onion tops mixed with the food, is highly advantageous, and, in the opinion of many persons, lessens very much the susceptibility to roup.

"With regard to animal food there is none equal to the natural supply of worms and insects obtained by the hen; small worms, or a barrowful of mould, containing an ant's nest, may be given if the chickens are in a con-

fined situation, and will be found far superior to boiled egg, chopped meat, or any more artificial substitute. Curds are frequently used, and, I believe, furnish the best substitute for the natural insect food, but I have had no experience in their use, as I have never kept, nor even think it desirable to keep fowls, or at all events to rear chickens, in situations where their natural food is unattainable. It is requisite that chickens should either have a constant supply of food or be fed at very short intervals—even every hour is not too often, if practicable."

Miscellaneous.

Increased production of Wheat in the Black Sea.—The exports of Wheat from Odessa and the Black Sea have increased to a vast extent during the past three years, for instance,

		Quarters.
Exports from Odessa in 1851 were	...	... 800,000
" " 1852 "	...	...1,400,000
" " 1853 "	...	...3,160,507

Had there been a continuance of peace the supplies to this country would have been overwhelming, in years when no other country required foreign imports of Wheat.

Management of Poultry.—The remark is often made, that chicken reared in the country by cottagers are more vigorous and healthy than those bred in the most expensive poultry houses; this I believe to be entirely owing to the more natural circumstances under which they are brought up. Fresh air, fresh Grass, and fresh ground for the hens to scratch in, far more than counterbalance the advantage of expensive diet and superior lodging, if these latter are unaccompanied with the more necessary circumstances just described.—*Tegetmeier's Profitable Poultry.*

Calendar of Operations.

AUGUST.

Border of the Fens, *August* 22.—Now that the harvest has made some progress it becomes daily more evident that we shall this year have an abundance of corn of excellent quality; the colour of highland Wheat is more uniformly of that bright healthy rich brown tint which does not often gratify the eye; and the weight of the sheaves is every where noticed by the reapers as remarkable; even where the crops are thin the bushel is soon filled, and the country will once more be blessed with corn enough of home growth for home consumption. The Fen Wheats are not yet ripe, and cutting has only partially commenced in the low lands; blight is complained of, but the favourable weather we have lately had has in a great measure restored the injured crops to a more healthy condition. We yesterday noticed a few pieces mildewed and looking dirty, but many heavy crops will, we think, yield a large return of good Wheat; price of reaping, 8*s.* to 12*s.* per acre. Barley is also productive this year, the colour is not acceptable to maltsters, although the grain is heavy, it may be still hoped that the malt will be good; the price has fallen at once below 30*s.* per quarter, and we should not be surprized to find the decline continue still further; cutting fom 7*s.* to 8*s.* 6*d.* per acre. Oats will be lower also, the crop is remarkably heavy and fine, and if secured in good order will be the best we have had for some years; mowing, tying, and dragging, 8*s.* to 12*s.* per acre. Beans are not good; Peas and Tares are spoken of favourably. Turnips and Coleseed are growing fast, and are generally a full and forward plant. Potatoes look well, and we have heard but little at present of disease; they also are cheaper, being 6*s.* to 8*s.* a sack of 16 stone, in place of 12*s.* to 16*s.* Stock of all kinds are now doing better, the pastures are not abundant, but sweet and nutritious. Care is required to see the ponds well cleared out where any water exists, and where water is scarce it is a good plan to have a trough nigh at hand, for the cattle and horses to drink from, instead of trampling in the ponds and wasting the water. Forward beasts have 3 lbs. or 4 lbs. of Linseed cake a day each, which improves them as much by making them quiet and settled as by the nutriment it affords; cows also require a little cake, 1 lb. or 2 lbs. per day will be sufficient, with some green Clover, to keep up a supply of milk and a fresh thriving state of the animal. During dry seasons, like the present, it is necessary to keep in readiness a couple of tools, a horse and a cart-rope, to pull out of muddy ditches such luckless horses or beasts as have a wandering propensity to stray from the limits of their inclosure,—sometimes, alas, compelled by lack of water, sometimes enticed by shortness of keep. Sheep also occasionally make fools of themselves by slipping down a bank, and barely escaping being smothered in mud. Hogs will luxuriate in such places, and wallow the course of several dike bottoms if not well tended, and perchance find their way into neighbours' corn. Smaller fowl also commit great depredations; ducks and hens raised as a perquisite to the farming man will occasionally swarm into fields of Barley, Wheat, or Oats, without leave, and with great loss to the next farmer. This is robbery by connivance, and should not be "winked at" but prevented. The custom is to give such cottage or farming man 3*d* per score for eggs, and 6*d.* each for all chickens raised fit for the market, the farmer providing fowls and food; such custom not uncommonly realising to the watchful cottager's wife 3*l.* or 4*l.* per annum. *J. W., Peterborough.*

Farm near Chelmsford, 17*th August.*—Since the commencement of harvest, on the 9th inst., we have been cutting Wheat and Barley extensively. The Peas which were cut in the preceding week are carried and secured, and yesterday we completed the first Wheat stack, and this morning, in full anticipation of a fine day, we commence another, as well as one of Barley, bu about 3 o'clock the rain fell in torrents and closed our harvest operations, since which not a breeze of air has been stirring. The first two days of the month were partially fine, but the 3d, 4th, and 5th, it rained without intermission, and the Wheat previously reaped is much sprouted, more so than we recollect in any former instance, and in most of the early pieces white Wheat has lost its colour, and has become more or less blighted; some pieces have changed nearly black, and the sample will be very coarse; but the pieces a week later are but little injured, and the major portion is looking as well as can be desired, but those still later are more or less beaten down and will be mildewed to a considerable extent on the portions lodged. Upon this farm we have escaped this pest, and with the exception of those pieces which were cut during the past week, have at present escaped injury, and have every appearance of yielding well. The Wheat in this district is, however, exceedingly variable, and will not, upon the whole, barely exceed an average crop, although many pieces are fine and promising beyond our most sanguine expectation. The Barley upon this farm is principally mown, and is very fine; the yield will be about 6 quarters per acre, and if fine weather succeeds, we anticipate carrying the whole by the middle of the ensuing week, but little Clover or Grass being intermixed to prevent harvesting quickly; and as regards the broad leaf or Red Clover, we never recollect so great a deficiency of plant, which we confess we hardly supposed the case, as it planted well in the spring, but now it appears to have been eaten off by insects. We have also been busily engaged hoeing out the late Swedes and White Turnips, which have planted well, and the latter are promising enough, but the former are irregular, having suffered from an attack of aphides, and the weakest plants have not since, nor will they, recover. The Mangold Wurzel is now progressing apidly, and recovering a similar attack, but it is more backward than usual, and will not be fine; many pieces upon neighbouring farms are so much injured as to render them almost valueless. The prevalence of these insects during the whole of the season has been without precedent; every description of vegetable, especially Turnips, Mangold Wurzel, and Beans being literally covered with them, and during several of the hot days of July the air literally swarmed with them, but since the first heavy rain they have gradually disappeared. Potatoes have within the last few days become diseased, upon this farm especially so, and since the suspension of our harvest work to-day, we have been busily engaged pulling up the haulm by hand, as a preventive of further mischief; it stops any further growth of the roots, but does not injure the Potatoes, and if commenced before the stems become much affected prevents extensive injury, and our previous experience enables us to state that the Potatoes are not in the slightest degree deteriorated by the process, but if left a sufficient time for the skins to become set before digging, will be found improved in quality. This, however, depends upon the varieties being early, but upon all, either early or late, we recommend the practice as the only means of saving the crop from extensive injury. You have been favoured with an article on Potato growing and thin sowing by Messrs. Hardy, but which, I believe, few Essex farmers accord with. This year the thin Wheat especially is not ripening well, and it is only such pieces that are full in plant, derived from about 6 pecks and upwards of seed per acre, that have ripened well or promise abundantly. There is a description of Rivett Wheat, called Payne's Defiance, very productive and still but little grown, as the millers do not approve of it for mealing, but it is admirably adapted for thin sowing on good land as it tillers well and is stiff in straw. Mr. Mechi states that it makes within 2*s.* per quarter of other varieties. Persons hereabout, however, have not found it so, it is one of the coarsest descriptions of bearded Wheat grown, and Rivetts, unless very fine, never reach the price of Red Wheat by several shillings per quarter, but upon suitable land the extra yield may compensate for the deficient quality. Upon our best lands we can grow as much white as red Wheat per acre, and it would not be worth our while to attempt growing such coarse descriptions, even if we succeeded; but upon land not calculated for the production of white Wheat it is quite another matter, and there, as we before stated, it may answer. The feed in the pastures and meadows is growing rapidly, and upon cool subsoils the second math Clover is good; nearly the whole upon this farm has been foddered green by horses and colts, and we regret to say is nearly consumed.

Monday, 21*st Aug.*—The foregoing was delayed being forwarded, and since that time we have been actively engaged carting Wheat and Barley. We commenced again on Friday at 10 o'clock, and have continued with four pitchers and loaders to this time; at 4 o'clock this day it again commenced raining, and with the barometer sinking fast we anticipate bad harvest weather. Scarcely any Wheat is carted in this part, except upon forward land, nor could harvest be considered general until this day. The Wheat will undoubtedly be better than we anticipated; the pitchers state the weight to be greater than usual, and the quantity of sheaves per acre exceeds our anticipation. Green crops progress very satisfactorily, but the blight is fast extending with Potatoes.

Rhins of Galloway, *Aug.* 21.—The fears in regard to the Wheat crop, which we hinted at in our last report, have turned out to be too well founded; very few fields are entirely free from rust, and many fields present a black, unhealthy appearance, so that the return will be very much below what was at one time expected. Oats are likely to turn out well, as they agree better with dark showery weather than the Wheat crop. Potato fields present a very desolate appearance, and will in many cases be an entire loss. Turnips, where free from disease, have made rapid progress of late, and promise to be over an average crop. Beans in many places are completely blighted. The pastures have been kept fresh by the occasional showers we have had, and stock are thriving well. Harvest has very partially commenced, but will not be general for ten days or a fortnight.

Notices to Correspondents.

Address: *J D.* We have a letter for you on Covered Yards, about which you inquired at page 540. Please send your address

Boiling Peas: *T L.* Lawson's Manual recommends the Early Charlton Pea as the oldest and best known variety of white Pea. It is much earlier than the Scimitar, longer strawed, and prolific.

Books: *X X.* Blacker's Essay on Small Farms, Nicholls' Farmer, Hints on Agricultural Economy as the Antidote to Agricultural Distress, by O. O. Roberts.

Four-Acre Piece: *Inquirer.* We beg pardon for the delay. The problem does not seem very difficult. You wish to have in spring 1 acre planted with Mangold Wurzel, half an acre with Rape then getting into flower, to be followed by Cabbage; half an acre of autumn-sown Vetches getting forward for use; half an acre to be sown with spring Vetches; half an acre sown with Carrots, and 1 acre planted with Potatoes. Suppose eight half-acre pieces with the following succession upon them:—1, Mangold Wurzel, April till October; 2, Potatoes, February till October; 3, spring Vetches, April till August and September; 4, Carrots, March till October; 5, Mangold Wurzel, April till October; 6, Potatoes (early sort), February till September; 7, Winter Vetches, October till June or July, followed by Rape, August till May; 8, Cabbage, June till November and December.

Gas Liquor: *J T B.* It varies exceedingly in the quantity of ammonia which it contains; 100 gallons may contain from 20 lbs. to 40 lbs. of ammonia. You will find that there is a very full account of it by Professor Way, in Blackie's Cyclopædia of Agriculture, art. Gas Waste. It is not "deleterious," much otherwise.

Guano to Wheat: *Young Farmer.* We would apply some 2 cwt. of Peruvian guano per acre, in moist weather, immediately before the harrow or the horse hoe, in early spring over the young Wheat crop. If your Wheat is liable to lodge and mildew, this will make it more so. Superphosphate, however, will not be of much service to it, and guano certainly will so far improve your promise of a crop that it will increase the straw, which will yield larger and more numerous, and, if weather permits, better filled ears.

Lois-Weedon: *Spes.* The wider intervals suggested by "I. A. C." were to enable horse husbandry. The so-called "exhaustion" of the land is needed, or your Wheat will be all down and mildewed together. On your third question we incline to think that Swedes and Beans alternately will be more productive, than if each on its own ground. We would advise, if labourers are plentiful with you, that you should follow Mr. Smith's plan in its full detail, as made known in his pamphlet.

Plot of Land: *J R, Belfast.* Your field is "out of condition, a sandy soil now in Oats, and one-half next year to be green crop:" the other half might be put to some pulse crop. If you can get it clean before winter, you might apply guano as manure, and sow Peas in March next. It would then easily be brought under alternate husbandry.

Salt and Lime: *T D.* We would not put on more than 30 bush. per acre of a mixture of 1 to 3 of this substance. It might very well be mixed with the damp sawdust you allude to.

Stock: *Suffolk Reader.* A farm of 150 acres, 60 acres being arable, "good land inclining to be heavy," is insufficiently stocked with "10 or 12 cows, 80 breeding ewes, lambs being sold in June and July, a few calves, 3 sows, and a few pigs." You ought to grow food for stock on such a farm equal to 100 tons of green food per month, and that should keep nearly 300 sheep. A cow, or a horse, may be put as equal to 9 or 10 sheep; a pig, or calf, as equal to two sheep, and you can easily perform the calculation.

Veterinary Works: *W O.* White's Compendium of the Veterinary Art, last edition; The Horse, by Youett; Cattle, by Youett; Cattle Medicine, by White.

THE ADVANCE OF SCIENCE IN AGRICULTURE.

RICHMOND and CHANDLER'S unprecedented celebrity for their improved CHAFF MACHINES and CORN CRUSHERS, achievable only by intrinsic merit, has secured for them the highest character in the trade, together with the confidence of the public, whether as regards true economy or the unapproachable finish and sterling quality which characterise all their productions, and render them worthy the reputation of a Manchester manufacturer.

The most distinguished authorities in all civilised countries report their unqualified satisfaction with the highly beneficial effects resulting from the use of these justly celebrated Machines, and with the now established fact of their not being subject to any of the contingencies inseparable from other machines, they are calculated to meet with general approval in the present advancing state of agriculture.

Address—Richmond & Chandler, Salford and Manchester; and 32, South John Street, Liverpool.

WEDLAKE'S OAT-CRUSHERS, CHAFF-CUTTERS, CARTS, HARROWS, PLOUGHS, and FLOUR MILLS.—118, Fenchurch Street, London.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY and CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS and KEY,
103, Newgate Street, and 52, Little Britain, London.

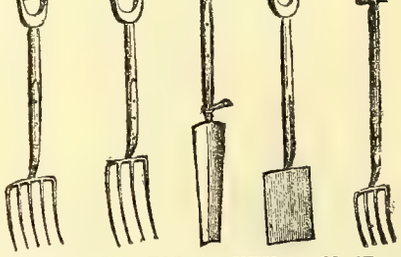
PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—Burgess & Key's Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.

103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.

103, Newgate Street, London.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

HOSE PIPING.—Great Reduction in Price.

PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.

BURGESS and KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.

IMPORTANT TO

FLOCK MASTERS.

SHEEP, LAMBS, HORSES, AND CATTLE,

Can be Dressed with

LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are non-poisonous, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as Arsenic or Mercury.

It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus promoting increased growth both of Mutton and Wool—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing no poison, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.

Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of

BARRY BROTHERS, Agents for Joseph Long,
Meriton's Wharf, and Shad Thames, London.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

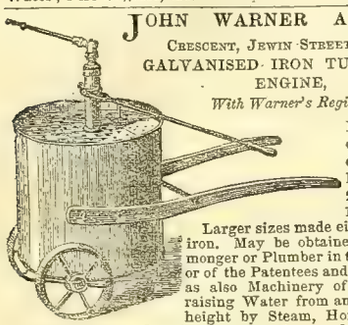
Every description of Machinery for Raising Water; Fire Engines, &c.

JOHN WARNER AND SONS,

CRESCENT, JEWIN STREET, LONDON.

GALVANISED IRON TUB GARDEN ENGINE,

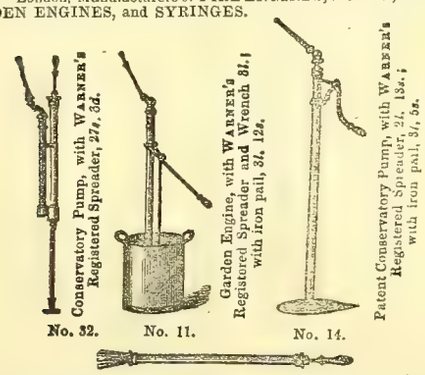
With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.



Conservatory Pump, with WARNER'S Registered Spreader, 27s. 3d.
Garden Engine, with WARNER'S Registered Spreader and Wrench 31. 1 with iron pail, 31. 12s.
Patent Conservatory Pump, with WARNER'S Registered Spreader, 21. 13s. with iron pail, 31. 5s.
No. 32.
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in stock.

Full size Syringe, on Read's principle, of the very best quality and workmanship, with two roses and one jet, 21*s.*; Plain Syringes from 10*s.* 6*d.* upwards.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

REDUCTION IN PRICE.

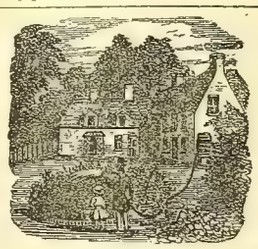
WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

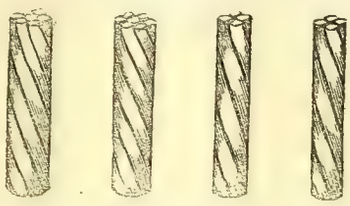
Catalogues, with Illustrations, sent free by post.



THE GUTTA PERCHA COMPANY'S TUBING FOR WATERING GARDENS, WITH ROSES AND UNION JOINTS FITTED.—27, CITY ROAD, LONDON.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

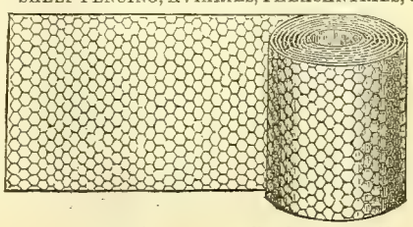
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

GALVANISED WIRE NETTING FOR GAME AND SHEEP FENCING, AVIARIES, PHEASANTRIES, &c.



Two-inch mesh, light	...	6*d.*	per lineal yard	2 ft. wide.
„ „ strong	...	8*d.*	„	„
„ „ extra strong		1*s.*	„	„

Any size or quantity made to order on the shortest notice. Special Estimates given for large quantities.

All kinds of Ornamental Wire Work made to any design.

GEORGE CASTON AND CO., Wholesale Wire Netting Manufacturers, Howard's Buildings, Brick Lane, St. Luke's, London.

Orders by post punctually attended to.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

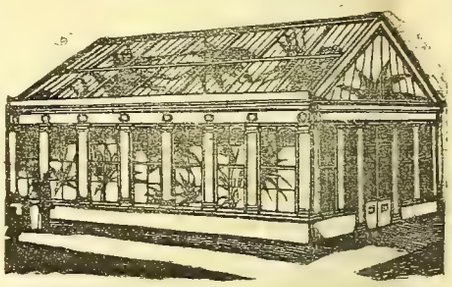
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



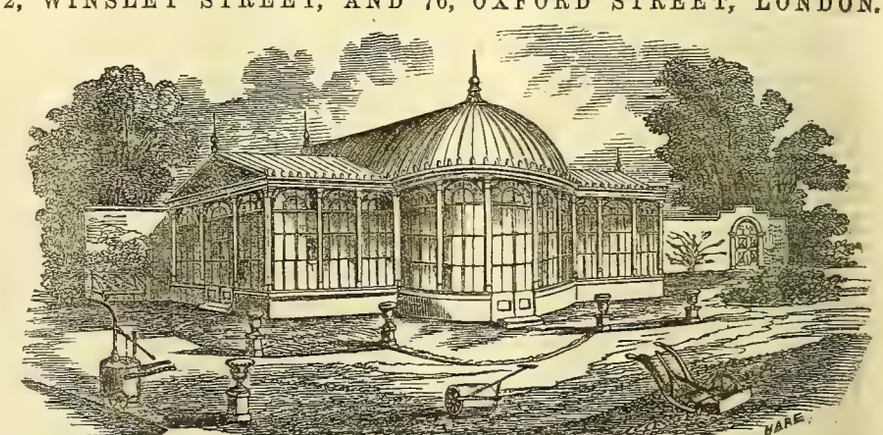
GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D, for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT SLUICE COCKS, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of FREEMAN ROE, Hydraulic Engineer, 70, Strand, and Bridgefield, Wandsworth.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. Archer, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

TO FLORISTS AND OTHERS.

J. JONES, Iron Merchant, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. Jones, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

THE CONICAL HOT-WATER BOILERS, as invented by John Rogers, Esq., are only to be obtained of JOHN SHEWEN, Ironmonger, Sevenoaks, Kent.
Contracts given for Heating.

STEPHENSON and PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

ENCAUSTIC TILE PAVEMENTS.

MAW and CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "the successful Imitation of Ofy's Alexandrinum, in the beautiful Encaustic Tile Pavement of Cloisters of Byzantine Court," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.
Specimens at 11, Aldersgate Street, City.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to Walter Carson & Son, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

THE FINEST FRUIT IN ENGLAND will be protected from Wasps by using HAYTHORN'S HEXAGON GARDEN NET, sent immediately by Mr. Haythorn, Nottingham.

WASPS! WASPS! WASPS!—No injury can be done to Fruit by Wasps, Flies, Birds, &c., if Haythorn's Hexagon Net is used. Recommended by all the principal gardeners. Direct Mr. Haythorn, Nottingham. Testimonials, patterns, and prices free by post.

THE BEST SHOW of IRON BEDSTEADS in the Kingdom is William S. Burton's.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 17*s.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21*s.*; and Cots from 21*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 19*s.* to 13*l.* 13*s.*

PAPIER MACHE and IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays,				
per set of three	...	...	...	from 20*s.* to 10 guineas.
Ditto, Iron ditto	...	...	...	from 13*s.* to 4 guineas.
Convex shape, ditto,	...	...	...	from 7*s.* 6*d.*

Round and Gothic Waiters, Cake and Bread Baskets equally low.

BATHS AND TOILETTE WARE.—William S. Burton has ONE LARGE SHOW ROOM devoted exclusively to the DISPLAY of BATHS and TOILETTE WARE. The stock of each is at once the largest, newest, and most varied ever submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Portable Showers, 7*s.* 6*d.*; Pillar Showers, 3*l.* to 5*l.*; Nursery, 13*s.* 6*d.* to 32*s.*; Sponging, 15*s.* to 32*s.*; Hip, 14*s.* to 31*s.* 6*d.* A large assortment of Gas Furnace, Hot and Cold Plunge, Vapour, and Camp Shower Baths. Toilette Ware in great variety, from 15*s.* 6*d.* to 45*s.* the Set of Three.

William S. Burton has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, 2, and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

MR. MECHI, 4, Leadenhall-street, London, feeling that these are progressive times, has made EXTENSIVE ALTERATIONS in his BUSINESS ESTABLISHMENT, which, he trusts, will be for the comfort and advantage of his customers, by enabling them to inspect readily his general manufactures, consisting of articles of luxury and economy, suitable for presents or for use. Independently of his usual extensive stock of ladies' and gentlemen's Dressing Cases, Work Boxes, and Desks, in Wood, Morocco, and Russia Leather, he has devoted one entire apartment to the most choice productions in papier mâché ware, contrasting strangely with the once much-prized ware of Japan and China. Catalogues will be forwarded gratis on application. Mr. Mechi has prepared a very choice assortment of elegancies and utilities for sale at his depôt, at the New Crystal Palace. His position is in the Nave, at the entrance to the French Court.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. Douglass, 18, Holland Street, Brixton, London.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by Dinneford & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

BLAIR'S GOUT and RHEUMATIC PILLS. Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "Thomas Prout, 229, Strand, London," is impressed upon the Government stamp

FRAMPTON'S PILL OF HEALTH.—"For upwards of nine years (writes Mr. Thomas Province, of Winchmore Hall, Middlesex), I have experienced the efficacy of this excellent medicine, and I have the happiness of saying that I never had a better state of health. I beg further to add that this medicine is in general use by my family, and we know of nothing to equal it." For females these pills are truly excellent, removing all obstructions, the distressing headaches so very prevalent with the sex, depression of spirits, dulness of sight, nervous affections, blotches, pimples, and sallowness of the skin, and gives a healthy juvenile bloom to the complexion. Sold by all medicine vendors, price 1*s.* 1½*d.* per box.—Observe that "Thomas Prout" is on the Government stamp.

HOLLOWAY'S OINTMENT AND PILLS EFFECT EXTRAORDINARY CURES OF BAD LEGS.—Mr. John Stokell, of West Harlsey, Northallerton, suffered for upwards of two years with several wounds of his legs; every means were tried in the hope of deriving some benefit, but without success, and the disease ultimately assumed so severe an aspect that it was considered amputation would be necessary in order to save his life. Hopeless as his case appeared he resolved not to undergo the operation, but commenced using Holloway's Ointment and Pills; the result was an almost immediate improvement, and by continuing these wonder-working remedies both legs were completely cured. Sold by all Vendors of Medicine and at Professor Holloway's Establishment, 244, Strand, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss Graham's NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by Ellen Graham, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss Orme.—"I have a full pair of Whiskers, thanks to Nioukrene." H. Robb, Esq.—"It has checked the greyness." Mrs. Jones.—"My hair is restored." Dr. Coffin.

METCALFE and CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—Metcalfe's celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at Metcalfe, Bingley, & Co.'s only Establishment, 130*b* and 131, Oxford Street, second and third doors west from Holles Street.

SHORT-HORN COWS FROM HORNCASTLE AND MELTON FAIRS.

MESSRS. JOHNSON, of the Manor Farm, Highgate, beg to inform gentlemen and the trade that they will show on TUESDAY next, the 29th inst., about 200 first-rate COWS and HEIFERS from the above Fairs. Out of this lot will be found several Animals of pure blood for breeding or exportation.

FARM WANTED.

WANTED, to rent, a FARM, within 25 miles of London, not exceeding 100 Acres, with Cottage and requisite Buildings. If near a Station on the South-Western or Great Western Railway preferred.—Particulars to A. K., 23, Gillingham Street, Pimlico, London.

MITCHAM, SURREY.

To Market Gardeners, Medical Herb-growers, and Others.

TO BE LET, with possession at Michaelmas next, a good mixed soil FARM, containing 122 acres, admirably adapted for either of the above purposes, with Residence and Homestead attached, only 8 miles from London, and 3 from the market town of Croydon.—May be viewed by permission of the tenant, and particulars had, on application to Messrs. Crawter, Land Agents, Surveyors, &c., 5, Bedford Row, London.

TO BE LET, with possession, at Michaelmas next, WIDNEY GREEN FARM, situate in the parishes of Fyfield and Willingale Spain, near High Ongar, in the county of Essex. It consists of 292 acres of land, of which 61 are Meadow, and the rest Arable. The whole is in very good condition, and has on it a most excellent commodious house with all requisite, very useful, and well arranged farm premises in capital repair. The whole forms a most desirable occupation, and will be let by the year or on lease.—For particulars apply to Mr. Oakley, Land-agent and Surveyor, 60, Doughty Street, Mecklenburgh Square, London.

TO BE LET, an old established NURSERY, containing a Cottage, Vinery, Greenhouses, and other Buildings, with half an acre of Land.—Apply to Mr. Cossey, Estate Agent, St. George's Middle Street, Norwich.

TO MARKET GARDENERS, NURSERYMEN, & FLORISTS.

Adjoining the High Road to Brentford and near to Kew Bridge.

TO BE SOLD, the Interest in the Unexpired Term of about 10 years of Lease of 17½ acres of highly productive GARDEN GROUND, with Cottage and commodious Business Premises. Part of the Land is stocked with healthy full-bearing Fruit Trees, and under crop of bushes, the remainder is cropped with usual Garden Crops, the whole being heavily dressed with manure. The stock may be purchased at a valuation, and immediate possession had.—For particulars, apply to Mr. W. T. Atwood, Land Agent, Mortlake, Surrey.

TO BE SOLD, GREENHOUSES — a bargain. One 12 feet long and 8 feet wide, 15*l.*; and one 21 feet long and 12 feet wide, 25*l.* Plans and particulars sent on receipt of a postage stamp, to Mr. Smith, Builder, &c., 1, Lower Street, Islington Green.

Greenhouses and Garden Lights, Window Sashes, Doors, &c., from 6*d.* per foot. Country orders forwarded.

SILVER SAND.

TO BE SOLD CHEAP, SILVER SAND, first or second quality.—Applications by letter to J. C. Spence, 32, Ludgate Hill, London, will be promptly attended to.

TO BE SOLD, GRASS CUTTING MACHINE.—Budding's Patent Grass Cutting Machine, 22 inches wide, for Lawns, Pleasure Grounds, &c., nearly new, will be disposed of considerably below the original price, the present owner having no further occasion for it. Apply to Mr. S. Mullinger, Ironmonger, Enfield.

N.B. A large assortment of Gardening Implements, the best manufacture, always on sale at London prices.

TO BE SOLD, FANCY POULTRY, consisting of imported BRAMAH POOTRA, WHITE-FACED SPANISH and PURE BUFF COCHIN, many having taken 12 and 14 Prizes, the property of Mr. Fox, who, in consequence of removing from his present residence, will dispose of the whole of his valuable collection of Poultry, which has been selected from most of the best stocks in this country.—For particulars apply at the City of London Wire Works and Blind Manufactory, 44, Skinner Street, Snow Hill, London. Illustrated Catalogues of Wire Fencing, Garden Arches, Trainers, &c., forwarded by post free, on application.

TO BE SOLD, BUFF COCHIN CHICKENS, from first class Prize Birds. Brahma Pootra Chickens, from imported American Prize Birds, and Spanish Chickens. Also some very good one-year-old Birds of the above descriptions. Wire, Game, and Poultry Netting, Poultry Hurdles, Hen-houses, Chicken Coops, Flower Stands, and Trainers, Garden Arches, and every kind of Wire Work, useful and ornamental.—T. H. Fox's, City of London Wire Works, 44, Skinner Street, and 6 & 8, Snow Hill. Illustrated Catalogues forwarded post free.

MR. W. T. ATWOOD will Sell by Auction, on TUESDAY, September 12, at 1 o'clock, at the Roebuck Inn, Turnham Green, Middlesex, the interest in the unexpired term of Lease of about 50 Acres of valuable FRUIT and GARDEN GROUND in the highest state of cultivation, situate adjoining the high road from Hammersmith to Brentford.—Particulars may be had till day of sale by application to Mr. Atwood, Land Agent, Mortlake, Surrey; or Mr. Plowman, 2, Upper Wellington Street, Covent Garden, London.

WARWICKSHIRE.

Seventh Annual Sale of Pure-Bred Shropshire Rams, Ewes, and Theaves,

The Property of the Right Hon. the Earl of Aylesford, at the Heath Farm, near Meriden, two miles from Hampton Station, on the North Western Railway, six from Coventry, and nine from Birmingham.

BROWN and CLARKE are honoured with instructions to submit to sale by Public Auction, on MONDAY, the 4th of September next, 31 SHEAR-HOG RAMS, 8 TWO-SHEAR RAMS, 1 THREE-SHEAR RAM, 100 EWES, and 100 THEAVES. Luncheon at half-past Ten o'clock, and the business to commence at Twelve o'clock precisely. The Sheep have been bred with great care, and will be found to possess all the most desirable qualities of this approved breed.—Catalogues may be had at the *Midland Counties Herald* Office, Birmingham; the Bull's Head, Meriden; Swan Inn, Coleshill; the Eagle, Rugby; and of the Auctioneers, Coventry.

NEW EDITION OF COL. HAWKER'S INSTRUCTIONS TO YOUNG SPORTSMEN.

In the press, the Tenth Edition, corrected, enlarged, and improved, with numerous Plates and Woodcuts,

INSTRUCTIONS TO YOUNG SPORTSMEN IN ALL THAT RELATES TO GUNS AND SHOOTING. By the late Lieutenant-Colonel P. Hawker. Revised and corrected by his Son.

*** The tenth edition of this work having been delayed by the death of the author, the publishers have the satisfaction of stating that, his son having carefully revised the work, it is now nearly ready for publication, with all the new improvements and valuable information collected and in part prepared for the press by Colonel Hawker, up to the time of his decease.

HARD TIMES.

By CHARLES DICKENS.

Bradbury & Evans, 11, Bouverie Street.

On the 31st inst. will be published, price 1*s.*, No. XII., completing

THE FIRST VOLUME OF

"THE NEWCOMES." By W. M. Thackeray.

With Illustrations by Richard Doyle.

Bradbury & Evans, 11, Bouverie Street.

POPULAR WORKS ON BOTANY BY DR. LINDLEY.

SCHOOL BOTANY; or, THE RUDIMENTS OF BOTANICAL SCIENCE.

400 Illustrations. 8vo. Price 5*s.* 6*d.* half-bound.

Bradbury & Evans, 11, Bouverie Street.

Lately Published,

THE ELEMENTS OF BOTANY, Structural and Physiological. With a Glossary of Technical Terms, and numerous Illustrations. 12*s.* cloth.

This completes the series of Elementary Botanical Works by Professor Lindley, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of The Elements of Botany, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12*s.*

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5*s.*

Bradbury & Evans, 11, Bouverie Street.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14*s.*,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'Vegetable Kingdom' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

Bradbury & Evans, 11, Bouverie Street.

ON MARRIAGE.

Just published (to be had free, by enclosing 1*s.* or Twelve Postage Stamps, to Mr. Watson, Clerical Agent, Robert Street, Adelphi, London).

MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

THE FOLLOWING WORKS ARE ALWAYS ON SALE AT THE OFFICE OF THIS PAPER.

Price 1*s.* 6*d.*, free by post 1*s.* 10*d.*

LABELS FOR THE HERBARIUM, CONSISTING OF THE NAMES OF THE CLASSES, ALLIANCES, ORDERS, AND SUB-ORDERS, OF PROFESSOR LINDLEY'S "VEGETABLE KINGDOM."

So printed in large type, that they can be cut out and pasted into The Herbarium.

J. Matthews, 5, Upper Wellington Street, Covent Garden.

Price 3*d.* each, or 5*s.* for 25 copies for distribution among Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, James Matthews, at the office of the *Gardeners' Chronicle*.

In consequence of the new postal arrangements, parties in the country who desire it can have copies sent by post; six stamps, in addition to the cost of the numbers, will pass 10 copies free by post.

The cost of a single copy, free by post, is therefore 7*d.*; and of ten, free by post, is 8*s.*

The Council of the Manchester Botanical and Horticultural Society, have arranged to open their NEW GLASS PROMENADE, covering an area of 1000 square yards, with a grand Botanical and Horticultural Exhibition. The articles to be exhibited will comprise Plants and Flowers, Fruits and Vegetables, Dried Flowers and Fruits, Wax Flowers and Fruits, Fountains and Vases, Flowerpots and Baskets, Garden Stands and Seats, Labels for Plants, Nets and Mats for covering Trees, Statuary for Garden decoration, Iron and Wirework for Garden purposes, Garden Implements of all kinds, with every other article connected with Gardening. Schedules are in course of preparation, and may be obtained on application to the Secretary.
By order, JOHN SHAW, Secretary.
Council Room, 40, Princes Street, Manchester, Sept. 2.

LILIUM LANCIFOLIUM, TRITONIA AUREA, AND VALLOTA PURPUREA.
HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to say that his extensive collection of the above BEAUTIFUL PLANTS is now in flower, and may be viewed every day (Sundays excepted). Admittance gratis.

CHOICE CALCEOLARIA SEED.
JOHN AND CHARLES LEE beg to state, they are now sending out packets of choice Calceolaria Seed, saved from a very SUPERB COLLECTION, price 2*s.* 6*d.* per packet.—Vineyard Nursery, Hammersmith.

PELARGONIUMS.
J. DOBSON AND SON beg to announce that their annual descriptive Catalogue of the above, containing full descriptions of the best varieties of Beck's, Foster's, Hoyle's, and other raisers, at reasonable prices, may be had on application.
Woodlands Nursery, Isleworth.

NEW PELARGONIUMS.
J. DOBSON AND SON beg to call attention to the advertisement in this Paper of August 12, which contains a full description, with prices, of Beck's and Fuller's new and beautiful Seedlings, to be sent out the first week in October.
Woodlands Nursery, Isleworth.

CUTHILL'S BLACK SPINE CUCUMBER.—Any person having any quantity, from an ounce and upwards, please to apply to the undersigned, as it is wanted for the Colonies by the end of September, and his own seed will not be ripe by that time. See last week's advertisement for Strawberry Plants, &c.—JAMES CUTHILL, Camberwell, London.

ARTHUR HENDERSON AND CO. beg to invite the attention of their patrons and the public to the splendid collection of HOLLYHOCKS now in bloom at their Kilburn Nursery. (This Nursery is in the Edgeware Road, and is about one mile from their Home Nursery, Pine Apple Place.)
Pine Apple Place, Edgeware Road, London, Sept. 2.

CHRYSANTHEMUMS.—Fine bushy plants of the above, both large and small varieties, for flowering this autumn, may be had at CHANDLER AND SON'S, Nursery, Wandsworth Road, from 9*s.* to 12*s.* per dozen.

MAY'S PARAGON CABBAGE.—Fine strong plants of the above can be had at 5*s.* per 1000, on receipt of Post-office order for the amount by applying to
HENRY MAY, The Hope Nurseries, near Bedale, Yorkshire.

LISIANTHUS RUSSELLIANUS.
J. AND J. FRASER beg to offer the above, in strong and healthy plants, such as will make large specimens for flowering next season, at 2*s.* 6*d.* each.
Lea Bridge Road, Essex, September 2.

CHRYSANTHEMUMS.
J. AND J. FRASER have a very superior Collection of the above, comprising the newest and best of Large-flowering and Lilliputian varieties. The plants are very strong, and will bloom well in the ensuing winter.

Lilliputians, fine plants	9*s.* to 12*s.* per doz.
Large flowering	9*s.* to 12*s.* „
New French varieties of 1854, not yet bloomed in this country	18*s.* „

Lea Bridge Road, Essex, September 2.

SEEDS OF CALCEOLARIA AND CINERARIA.
E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, the new Seed saved this season from their unrivalled collection, in packets at 2*s.* 6*d.* and 5*s.* each.

The CALCEOLARIA, first quality	5*s.* 0*d.*
„ second „	2 6

QUALITY, and not QUANTITY, forwarded at the above prices.

THE PAST WINTER AND SPRING have induced YOUELL & Co. to publish a CATALOGUE of RARE and HARDY CONIFERS and HARDY ORNAMENTAL SHRUBS, that have proved with them perfectly hardy in this well-known bleak district, exposed to the cutting winds from the North Sea.
This Catalogue also contains an extensive selection of the most useful Greenhouse Plants, Camellias, Ericas, Epacris, Chrysanthemums, Hollyhocks, Tree Carnations, Carnations, and Picotees, Fuchsias, Verbenas, Phloxes, &c., which will be forwarded (stamped) on receipt of two postage stamps.
YOUELL AND CO., Royal Nursery, Great Yarmouth.

BULBS FOR WINTER BLOOMING.
GOOD HYACINTHS, JONQUILS, CROCUSES, &c., for sale, at moderate prices, by the Importers.
MESSRS. SUTTON AND SONS, Seed Growers, Reading.

NEW BROWN COS LETTUCE SEED,
FOR PRESENT SOWING.
SUTTON AND SONS, Reading, have just harvested some of their choice sort of BROWN COS LETTUCE for sowing now to stand the winter. Price 1*s.* per packet. Excellent Cauliflower, Onion, Spinach, &c., for autumn sowing.

GRASS SEEDS.
SUTTON AND SONS *recommend the sowing of* GRASS SEEDS *at this season for Permanent Pasture, and are now prepared to supply excellent fresh Seeds for the purpose at very moderate prices.*
Also New Italian Rye Grass and Trifolium incarnatum, at moderate prices.—JOHN SUTTON & SONS, Seed Growers, Reading.

STRAWBERRY PLANTS.
CHARLES KIMBERLEY has a large stock of the following to offer at 3*s.* 6*d.* per 100:—Keens' Seedling, British Queen, Hooper's Seedling, Elton Pine, Princess Alice Maude, Stirling Castle Pine, and Comte de Paris.
Stoke Nursery, near Coventry.

STRAWBERRIES, 3*s.* per 100.—Strong well-rooted runners are now ready. British Queen, Eleanor, Prolific, Kitley's Goliah, Cuthill's Black Prince, Princess Alice Maude Myatt's Hautbois, Rivers' Eliza, &c.
BASS AND BROWN, Sudbury, Suffolk.

STRAWBERRIES.
WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy. RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.
Eggleseliffe, near Yarm, Sept. 2.

SPLENDID BULBS.
DAWE, COTTRELL, AND BENHAM (Successors to Frederick Warner) have just received their imported DUTCH and other BULBS in finer condition than for several years past, more especially their Hyacinths, Crocus, and Tulips. Catalogues on application.—3, Lawrence Pountney Lane, and 36, Moorgate Street, London (late 28, Cornhill). Established 1720

LOCKSBROOK NURSERY.
R. SHACKELL has strong plants of his Russian Superb Violet, now in excellent order for potting, at 1*s.* per dozen. Double Purple Perpetual Tree Violet, at 3*s.* per doz. Neapolitan Violet, at 3*s.* per dozen. Other varieties at low prices; hamper included, if the order be at once. It is requisite to pot the Violet early to insure a good display of bloom through the winter months.
ROBERT SHACKELL, Florist, Locksbrook Nursery, Bath.

HUGH LOW AND CO. would inform their friends and customers that they are now receiving their BULBOUS ROOTS from Holland. The collection comprises all the kinds of Roots suitable for early forcing, and they have been selected with care from the leading houses in Haarlem. Any orders entrusted to them will have every attention, and they feel satisfied they are in a position to supply them to the satisfaction of their customers.—Clapton Nursery.

ORCHARD HOUSE CULTURE.
THOMAS RIVERS will feel pleasure in showing his ORCHARD HOUSE TREES and their culture to any one wishing to see them. In addition to the Peach and Nectarine Trees, now in full bearing, fourteen large houses are fully stocked with Peaches, Nectarines, Figs, and Vines, in various stages of growth, and all in pots. A convenient morning train leaves Bishopsgate Station at 11.30, arriving at Harlow (1¼ mile from the Nurseries), at 12.21.
Nurseries, Sawbridgeworth, Herts.

CAMELLIAS.
TO BE SOLD, several fine TREES, 6 to 8 feet high, full of buds.
R. ERRINGTON, Oulton Park, Tarporley, Cheshire.

LARGE CAMELLIAS, AZALEAS, ETC.
TO BE SOLD, on moderate terms, in consequence of a removal, Twenty CAMELLIAS, of good sorts, from 4 to 10 ft. in height, well set with bloom; Two large AZALEAS and other GREENHOUSE PLANTS.
Apply to C. CREAMER, 4, Barnes Street, Stoke Newington.

TO BE SOLD, Sixteen CAMELLIAS, good sorts, from 2 to 8 feet in height; Seventeen ORANGE TREES, 3 to 7 feet; and Two SHADDOCK TREES, 8 feet; in the neighbourhood of Clapham.—Apply, by letter only, to A. GREGORY, Box Cottage, Petersham, Surrey.

TO SEEDSMEN AND OTHERS.
EARLY ASH-LEAF POTATOES.—One Hundred Sacks of Early Ash-leaf Kidney Potatoes, either for immediate delivery or deferred to suit the convenience of purchasers. Large buyers will find this a most eligible opportunity for purchasing.—For price, &c., apply to J. WILSON, Seed Potato Merchant, Ipswich, Suffolk.

EARLY DWARF SEED POTATOES.
ABRAHAM HARDY AND SON'S Ten selected earliest varieties of SEED POTATOES are now ready to send out, warranted free from disease. Retail and trade prices on application.
Also their improved BATH COS and Hardy HAMMERSMITH LETTUCE SEED, growth of 1854. Six-pennyworth of these, or other seeds of Cauliflower, Flower Seeds, &c., for September sowing, will be sent to any address, post free, on receipt of 6*d.*, or six stamps. Price per pound to the trade, on application.—Maldon, Essex, September 2.

THE BEST PLANT OF THE SEASON.

"BEGONIA PRESTONIENSIS SUPERBA."

W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr. Frost, Gardener to E. L. Betts, Esq., Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with stamens and petals, resembling a double blossom with a golden tinge, exhibiting a charming contrast. The flowers are delightfully fragrant as a Tea-scented Rose. Habit—dwarf and bushy; the flowers are thrown well above the foliage, in large trusses, and altogether one of the best plants yet offered. It received the highest award in June, at the Royal Botanic Show, Regent's Park, as a new plant; also at Maidstone and Ashford. Plants in October, 10*s.* 6*d.* each; one given where three or more are taken.—Bower Nurseries, Maidstone, Sept. 2.

HOLLYHOCKS, DAHLIAS, AND DUTCH BULBS.

GARAWAY, MAYES, AND CO. beg to call the attention of Florists, and the Public generally, to their large collections of HOLLYHOCKS and DAHLIAS, which comprise all the newest and choicest varieties in cultivation, and are now coming into full bloom, and which they will be happy to show to all interested in these favourite Plants. Their Hollyhocks this season are particularly fine, and in additiou to their collection of named varieties, they have an unusually fine batch of Seedlings, from seed sown in the spring of 1853, now in bloom.

G. M. & Co. also beg to announce that they are now receiving their annual consignment of BULBS from Holland, comprising Hyacinths, Tulips, Crocuses, &c., which are this year in good condition and moderate in price.

Priced Catalogues of Dahlias, Hollyhocks, and Dutch Bulbs may be had on application.—Durdham Down Nurseries, Bristol.

STRAWBERRIES.

BARRATT'S MAGNUM BONUM.—In size, this splendid Strawberry very far surpasses the "British Queen," is an exceedingly heavy cropper, and continues in perfection later than almost any other variety. Its flavour is really delicious, most nearly approaching the true Pine Apple of any kind yet known. Price per 100, 2*l.* 2*s.*; per dozen, 6*s.* Good strong Plants of the above are now ready for sending out by

WM. BARRATT.

St. John's Nursery, Wakefield.

N.B. W. B.'s List of 40 kinds of Strawberries may be had gratis.

STRAWBERRY PLANTS.—The best varieties for early and late growing, which have been thoroughly proved and given every satisfaction, are the undermentioned first-rate varieties, now ready.

Nimrod, 15*s.* per 100; Ajax, 5*s.*; Ruby, 5*s.*; Prince of Wales, 10*s.*; Trollope's Victoria, very superior, 5*s.*; Myatt's Surprise, 3*s.*; Myatt's Eleanor, the best and latest bearing Strawberry in cultivation, 3*s.*; British Queen, true, 3*s.*; Alice Maude, 3*s.*; Black Prince, very early, 3*s.*; Eliza, 3*s.*; Prolific, very fine and early, 3*s.*; Cremont's Perpetual, or Double-bearing Strawberry, 3*s.*

A remittance must accompany the order, either by Post Office Order or Penny Postage Stamps, on receipt of which the plants will be sent in hamper and package free, for all orders above 5*s.*

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm; it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & SONS can confidently recommend this, as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100, 50*s.*; 50, 30*s.*; and 25, 16*s.* Also strong Plants of MYATT'S British Queen, Cinquefolia, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5*s.* per 100.

Manor Farm, Deptford, September 2.

"SIR HARRY."—The eminent success of this new SEEDLING STRAWBERRY, at the only Floral and Horticultural Exhibitious where it has been shown, viz., Chiswick, first-class Certificate; 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize—induces the proprietor (hitherto an amateur grower only) to offer it for sale.

The characteristics of the plant are these:—Ripening as early as Keens' Seedling, but continuing fruiting a much longer time—a great cropper, bearing a very large handsome dark crimson berry, which carries that superb colour not only quite through, but to its very end, whilst, being both firm and juicy, it separates itself entirely from its calyx, without having a tasteless core. The delicious and luscious flavour of the fruit, united with its high perfume, throws utterly into shade the Keen and British Queen. The leaves are few, and the vigorous extension of its bearing branches exposes the fruit to the ripening influence of the sun, the want of which exposure is a great cause of failure in many sorts of this class of plant.

An oil-painting of a one-year-old runner, with its gigantic fruit in the respective stages of growth (as sketched from nature), is now to be seen in the Birmingham Exhibition of the Society of Artists, and coloured Lithographs have been taken from it by an eminent London Artist, which may be had on application, price 2*s.* 6*d.* each, in postage stamps.

The Plants will be ready for sending out (not less than a score) on the 20th September next. Prices—100 plants, 6*l.*; 80 plants, 5*l.* 10*s.*; 60 plants, 4*l.* 4*s.*; 40 plants, 2*l.* 17*s*; 1*l.* 10*s.* for a score. A few plants in pots may be had. Apply to MR. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham; each application to be accompanied with a Post-office order (on Birmingham) or cash, to receive attention.—September 2.

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

CHRYSANTHEMUMS, LILIPUTIAN AND LARGE FLOWERING.—Large and remarkably fine Plants of all the best Sorts, in 32-sized pots, fit to make really good Specimens at once, at 18*s.* per dozen; smaller Plants, in 48*s*, to flower in the coming winter, at 8*s.* per dozen.

VERBENAS.—All the new Varieties let out by Smith, Bragg, Mockett, and others, in 1854, at 8*s.* per dozen; older Varieties, 6*s.* per dozen—all well established.

FAIRY AND FABVIA ROSES.—Large healthy Plants, in 48*s*, at 8*s.* per dozen.

SEEDLING HERBACEOUS CALCEOLARIAS, AND SEEDLING CINERARIAS, at 5*s.* per dozen in October. These Plants have been raised from the Flowers which were so highly admired at this Nursery during last season.

FRENCH SPOTTED OR NEW FANCY GERANIUMS.—Well-established Plants of these beautiful Flowers, at 2*s.* 6*d.* each, or 25*s.* per dozen, in October next—a large consignment (including all the best raised in France, several of which have not been seen in England) having been just received at the Floral Nursery.

An immense stock of nearly all the new and best Bedding GERANIUMS, FUCHSIAS, HELIOTROPES, TROPÆOLUMS, and other Soft-Wooded Plants, always on hand, at prices equally low.

The Stock of SHOW and FANCY GERANIUMS at the Floral Nursery is unquestionably the largest and best in the kingdom, no expense having been spared to render it perfectly unique; all the new plants of the best raisers are added as they appear. Well-established plants of upwards of 1000 sorts may be had early in October next, at prices which will place competition at defiance.

The trade fairly and liberally dealt with, and all plants sent out will be warranted true to name.

A remittance or satisfactory reference indispensable from unknown correspondents. Catalogues forwarded gratis.

JOHN WESTWOOD, PROPRIETOR.—Sept. 2.

NEW CINERARIAS.

ROBERT REA begs to announce that he will send out, the first week in October, the following New CINERARIAS, and, from their first-rate character, and being unequalled by any yet sent out, he feels confident they will give universal satisfaction.

IPSWICH BEAUTY (REA'S).—Clear white, deeply edged with lake, shaded with purple; very dark disc, full size; broad petals, slightly cupped. A fine exhibition flower. First Class Certificates were awarded at Ipswich and Colchester, the only places where it was exhibited. Pronounced by all who saw it to be the finest Cineraria ever exhibited. Plants 10*s.* 6*d.* each.

GEM (PARKER'S).—A self-coloured flower; beautiful puee, with light disc; quite novel in colour, and a very striking first-rate variety. First Class Certificate, Ipswich, 1853. Plants 7*s.* 6*d.* each.

In consequence of having only one plant of the first to propagate from, the stock is very limited, early orders are therefore respectfully solicited, which will be executed strictly in rotation as received. The usual discount to the trade, and one sent over when three are ordered.—Ipswich Nursery, Ipswich. Sept. 2.

BASS AND BROWN are now saving several of their choice Seeds, and can strongly recommend the following, which have been selected with their usual care from their superb collection:—

CALCEOLARIA, very choice, 1*s.*; extra superb ...	2*s.*	6*d.*
CINERARIA, very choice, 1*s.*; extra new and choice	2	6
FUCHSIAS, from new and choice	1	0
GERANIUM, very choice, 1*s*; extra new and choice	2	6
from finest fancy varieties	1	6
"		
GLOXINIA, fine, 6*d.* extra from new and choice ...	2	6
ANTIRRHINUM, choice, 6*d.* extra from superb flowers	1	0

A List of Choice Seeds selected for Autumn sowing may be had free by post on application.

Post-office orders to be made payable to BASS & BROWN, or STEPHEN BROWN. Penny stamps received for small amounts.

Seed and Horticultural Establishment, Sudbury, Suffolk.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Pine-apple Place, Edgeware Road, London.

HOT WATER APPARATUS, adapted for Horticultural and every other description of Buildings; improved Boilers, requiring no brickwork, Warm Air Apparatus, &c.—S. S. TAYLER, ENGINEER, Battersea.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

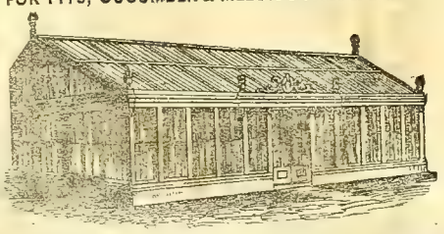
AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

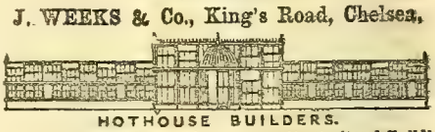


JAMES WATTS, HOTHOUSE BUILDER, 3, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in Eng and.

HORTICULTURE IN ALL ITS BRANCHES.

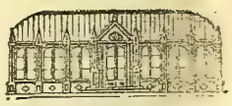
J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Building or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

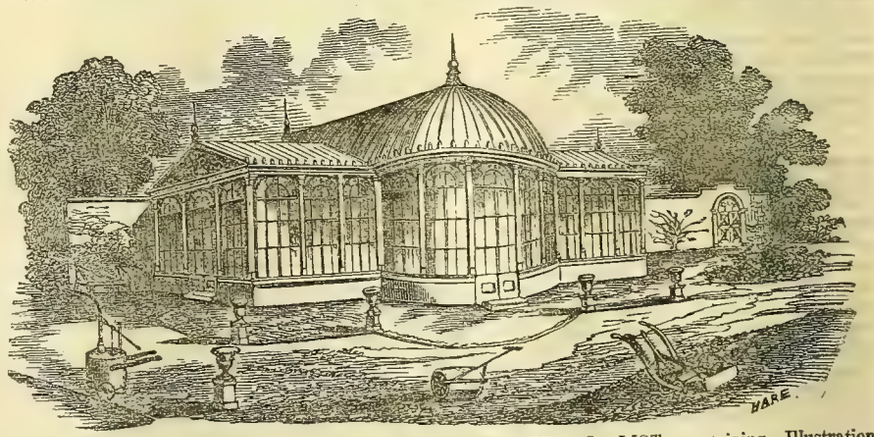
J. WEEKS & Co., King's Road, Chelsea, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out new seed of this year's saving, which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1s. 6d. and 2s. 6d. each; also a few packets of choice Cineraria Seed at 1s 6d. and 2s. 6d. each. Primula sinensis, all saved from fringed flowers, 1s. per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.—Sept. 2.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9s. per dozen. A list of names forwarded upon application.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Established plants, in 3-inch pots, at 3s. per dozen.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

LILIUM LANCIFOLIUM.

N. GAINES' Collection of this beautiful Flower is now in bloom, containing hundreds of Seedlings, many of them having obtained Prizes at the Metropolitan Exhibitions.

N. G. begs to inform his friends and customers that he has been very fortunate in Propagating the collection of French and other Pelargoniums, therefore he will be able to supply good Plants of all the leading kinds exhibited this last season.

N.B. N. GAINES' collection of Dahlias is now in flower, and may be seen any day, Sundays excepted.

Nursery, Surrey Lane, Battersea, September 2.

SPLENDID NEW CINERARIA "OCTAVIAN."

JOHN KER, FLORIST, Bristol Road, Birmingham, has the pleasure to announce that he will commence sending out Plants of this truly magnificent Cineraria in October. It possesses more good qualities than any other out, viz., a fine robust habit, continues longer in flower, commencing in December; it will continue through the whole winter, till May, to send up dense trusses of large beautifully scented flowers, filling the whole house with their odour; flowers large, colours well contrasted, petals pure white, tipped with purple, broad and well imbricated, disc dark. Has been awarded a first class certificate of merit by the Midland Floricultural Society, and pronounced by the judges then present a magnificent variety. Has been highly commended in No. 289 of the "Cottage Gardener."

Plants 10s. 6d. each, Post-office orders payable at Birmingham. Parties wishing early attention will please give their orders. Many have been received, and will be sent out in rotation.

HOLLYHOCKS.—A collection of this fine old English flower, grown at the Cheshunt Nurseries, is now in bloom, and there will be a succession till the end of October. Admirers of the Hollyhock are respectfully invited to visit the Nurseries to inspect them. In addition to the choicest varieties of other growers, there are many rare and beautiful kinds of their own production, and to be seen only at their grounds.—A. PAUL & SON, Nurseries, Cheshunt, Herts (13 miles from London, on the Cambridge line of Eastern Counties Railway).

LORD KEYNON'S FAVOURITE CUCUMBER is the best and most productive for winter cultivation ever grown, requiring less heat than any other of the kind; it is a very handsome fruit and free setter. Good old seed of the above true variety may be had, price 2s. 6d. per packet, postage free (or penny postage stamps to the amount).

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Churchyard, Bath, Somersetshire.

NEW FUCHSIAS, VERBENAS, AND PETUNIAS OF 1854 AT REDUCED PRICES, with other NEW and SELECT PLANTS.

For BASS AND BROWN'S Advertised Lists of the above, see *Gardeners' Chronicle* of July 22 and 29, and August 5.

SUPERB NEW CHRYSANTHEMUMS.

12 best new Pompone varieties of last season ... ... 12s.
10 best new large flowering do. do. ... ... 10s.
60 splendid varieties of Pompone and large flowers, including new, 40s., or, per dozen ... ... 9s.

These are all fine and strong for flowering.

Catalogues free for three penny stamps. Post-office orders payable to BASS & BROWN, or to STEPHEN BROWN, Post Office, Sudbury, Suffolk.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 2, 1854.

THE attempt to discover the connection between effects and their causes, especially in cases where unforeseen or novel results are produced, is amongst the most ordinary occupations of the human mind, constantly leading to inquiries of greater or less value, and often attended with the most remarkable as well as the most important discoveries in matters of science. It needs, however, but little foresight to perceive that the more ignorant the mind set in operation the more likely is it that false deductions will be produced; and the more marvellous the object of inquiry the more likely is it that the more extravagant will be the end arrived at. In natural history, especially, how many popular errors have been and even still are in vogue, even in relation to matters of every-day occurrence, and which a little clear-sightedness, both mentally and ocularly, would dispel. We need not go back to the days when the appearance of a comet or a meteor was looked upon as the forerunner of the direst events,* or when even the emission of the red-coloured fluid by butterflies (recently emerged from the chrysalis state) was regarded with equal dread, being mistaken for bloody rain. Nearer our own times we have been taught the doctrine of spontaneous generation, because ill-educated observers have failed to trace the cause of the sudden appearance of myriads of insects where they had not been previously observed; and at this very day the development of parasitic animals has been referred to the weakened powers of what have been termed the higher objects of creation no longer able to fulfil their own reproductive process, but still endowed with sufficient energy to develope the miscalled less-highly-organised objects. The Vine disease in Lombardy and the cholera in the south of France have, within the last few weeks, been ascribed by the peasantry to the introduction of the railroad, the carriages upon which have even been fired at and damaged as propagators of the maladies in question.

Our own country has also not been without its fallacies of a similar kind. We have had the Potato disease attributed to the attacks of a well-known species of aphis, and no less than three different common phenomena of insect life have been assumed as the origin of the cholera. From numerous communications which have appeared, both in the local and scientific journals, on the subject, we select one,* as more especially calling for comment, both from its having appeared in the "Lancet" (a periodical of sufficient medical importance to lead the reader not to expect any absolutely extravagant views in its pages), and secondly, as coming from a M.D. and a naturalist. The attention of this writer was called to several flies which had died on a window, each being surrounded by a circle of white opaque particles, evidently discharged by the fly; an acquaintance—"a bold and firm person, without fear"—thereupon swallowed about half the matter surrounding one of the flies at bed-time, and early next morning he was seized with an alarming attack of cholera, which left him weak for a day or two. Soon afterwards the cholera disappeared, no new cases had been reported for 18 months, when another dead fly (now termed a *cholera fly*) was seen on the window (he does not say where), and on making careful inquiry he found that two cases of cholera had occurred at Leith. He does, however, add that he called the attention of some friends in London to the cholera flies which stood dead on the windows, whence it was easy to foretell the approach of the disease, "which at the time raged in the north of Europe, and in a few days it fell on Newcastle." Now, the appearance in question is very common, and has been known for years. It was described by KIRBY and SPENCE as a kind of plethora, to which flies are very subject in autumn. Mr. MACLEAY described it at the first meeting of the British Association at Liverpool (at which Dr. LINDLEY compared it to the attacks of the Botrytis Bassiana on silk-worms); and 17 years ago the author of these remarks published magnified figures of it in the Transactions of the Entomological Society (vol. ii. p. lxiv. pl. xx., fig. 2 *a*, *b*, *c*.)

Not content, however, with referring the disease in one case to the dead fly on a window hundreds of miles from the place of its outbreak, and in the other to the inward application of half the matter discharged by one dead fly—the writer goes on to ascribe it to vast flights of living flies. Being on the banks of the Solway one day during the autumn of the year the cholera attacked Dumfries, he became unusually languid, and on returning and reaching Annan, he observed "seemingly over the town of Dumfries a vast cloud in motion extending from earth to heaven remaining in the same place, but every particle of it seemed to be in motion." He left the neighbourhood the next day, the languor and feebleness leaving him as he left the valley of the Solway, and next morning he was in the best health and spirits, but on that day he heard that the cholera had rested on Dumfries on the previous evening. Now the appearance given of this great flight of insects is exactly that of a cloud of midges or gnats hovering in the air in the evening. This is so well known a habit as to have entered the domain of poetry; thus SPENSER, in the "Faerie Queen," says—

> ——"When a swarme of gnats at eventide
> Out of the fennes of Allan doe arise,
> Their murmuring small trumpets sownden wide,
> Whiles in the air their clustering army flies
> That as a cloud does seem to dim the skies."

But we are told that the flies seemed to hover over the town of Dumfries, and not over the country. To this we reply that it is not possible to judge precisely of the distances of objects in the air, and that the swarm was evidently much closer to the observer than he fancied, because he distinctly saw the motions of the individual flies.

In his paper, moreover, the writer has confused this flight of gnats with the migrations of aphides, of which, during the course of last autumn, at the period when this cruel malady attacked some of the towns of the north of England, great swarms took place, just as is the case, not in every—but in many seasons—and forthwith these little flies were set down as the propagators of the disease. The attention of the Entomological Society was directed to this circumstance at the November meeting of 1853 by a gentleman who exhibited some of the flies, which proved to be of two or three species of aphides (mostly, however, of A. Rumicis) which feed on a great variety of plants. At the end of September and beginning of October, 1853, we received sundry communications on this subject. From Haddington, in the south of Scotland, one of our correspondents sent us numerous specimens of Aphis brassicæ, which had appeared in swarms at that place, injuring the Turnips as well as the foliage of Peaches and Nectarines, Cherries, and Carrots. Another correspondent sent us the same species from Tesmond, near Newcastle-upon-Tyne, where it appeared at the time the cholera was raging in that district. The aphides have, however, no local connexion with Newcastle, but during the autumnal months the usual migration of the winged females occurs often in immense swarms; thus GILBERT WHITE tells us that in the afternoon of the 1st of August, 1785, the people of the village of Selborne were surprised by a shower of aphides or *smother flies*; those that walked in the street were covered with the insects, which blackened all the vegetables upon which they alighted. They were observed at the same time in great clouds about Farnham, and all along the vale from Farnham to Alton; and WHITE observes that they were then no doubt in a state of migration, and might have come from the great Hop plantations of Kent or Surrey, the wind being at the time in the east. KIRBY and SPENCE mention another instance which they witnessed later in the year in the Isle of Ely, when their clothes were covered by them, the insects incessantly flying into their eyes, nostrils, &c. In 1814, in the autumn, they were also so abundant for a few days in the vicinity of Ipswich, as to be noticed with surprise by the most incurious observers, as they were again on the 26th and 27th September, 1836, at Hull, York, and Derby, as stated in the local newspapers of those dates. Further observations on the migrations and flights of aphides are given by Mr. G. H. K. THWAITES, in the Proceedings of the Entomological Society of the 6th September, 1847, and by Mr. WALKER in the Transactions of the same society, vol. v., p. 61. All these direct observations fully prove that the swarming and migration of aphides is a natural habit in their economy, and has no connection with the disease, which is also fully proved by the experience of the present year. During the past spring, aphides abounded to an unusual extent, and we had no cholera; now we are free from aphides, but the malady has appeared amongst us. Need we dwell longer upon the preposterous "notions" promulgated in the *Lancet*? *J. O. W.*

WE see with much pleasure that an attempt on the part of the Legislative Council of CEYLON to get rid of the BOTANIC GARDEN of the Island has been defeated by the good sense of Sir GEORGE ANDERSON, the Governor. What the precise reason may have been which led to this proposition we do not know; but we certainly think that those who attempted to carry so absurd a measure must have had very little knowledge of the object of a Botanic Garden in the Colonies. That some Botanic Gardens have failed in answering any good purpose must be admitted; and they have been suppressed, as they deserved to be, for they were little more than kitchen gardens for the support of the Governor's table. But it does not follow that such establishments are useless; on the contrary, with good management, they are among the more powerful agents of civilisation, for they teach men wants and how to meet them, and they indicate the sources of some of that natural wealth which is to be found in every country, did we but know where to look for it.

How far the garden at Peradenia fulfils these conditions we are unable to say of our own knowledge; but we most willingly bear our testimony to the zeal and capability of the present excellent superintendent, who is one of that hard-working phalanx of Indian naturalists represented by ROXBURGH, BUCHANAN-HAMILTON, GRIFFITH, GARDNER, and WALLICH—now alas! all dead—and by WIGHT among the living. He is perfectly able to deal with the subjects that must engage his attention; and if his labours shall eventually lead to no result, it will be owing either to Colonial parsimony or broken health, and not to want of industry and knowledge.

We must admit that the Botanic Garden at Peradenia has been unfortunate. It first came into notice through a miserable catalogue of plants, prepared by one MOON, a man sent out without a single proper qualification. Then came MACRAE, a good gardener and pains-taking man, inured to the West Indies, but he died in two or three years; to him succeeded a half-caste Indian gardener, named

* "Anno Dom. 793. This year dire forewarnings came over the land of the Northumbrians, and miserably terrified the people; there were excessive whirlwinds and lightnings, and fiery dragons were seen flying in the air. A great famine soon followed these tokens; and a little after that, the ravaging of heathen men lamentably destroyed God's church at Lindisfarne through rapine and slaughter, and Siga died." *Anglo-Saxon Chronicle.*

* The Cholera Fly. By ROBERT KNOX, M.D. Lancet, 1853, p. 479.

WATSON, who proved entirely unworthy of the recommendation of those who had known him in Hindostan; NORMANSELL, a clever young surgeon, followed, but the climate broke him down before he had accomplished anything; GARDNER succeeded, an excellent man, with a constitution seasoned by a long residence in Brazil, and he made considerable progress, but his "Introduction to Botany," his "Flora of Ceylon," and all his plans for developing the vegetable riches of the island, were brought to an end by excessive exertion, which carried him to an untimely grave. And now they have Mr. THWAITES, whose health seems to be proof against a Candian climate, who labours diligently to complete what GARDNER began, and to whom alone on this rich island can reference be usefully made when any question belonging to vegetable products is raised; and him the Legislative Council would remove.

Coffee, Cinnamon, and Sugar; Sugar, Cinnamon, and Coffee; Cinnamon, Coffee, and Sugar—these are the words of power in Ceylon. At present they form the peculiar staples of one of the richest islands in the world; but for Rice is not worth mentioning. What else do we get from Ceylon? Cotton? Not a bale. Indigo? Not a maund. Textile materials? None. Timber? Next to none. Cacao? None. Tobacco? None. Dyes? We believe none. From so great an island, with an infinite diversity of soil and climate, and rich in everything that Nature can produce without assistance, we receive no vegetable materials worth speaking of except Coffee, Cinnamon, Rice, and Sugar, with a few parcels of Cardamoms and Arrow-root.

The wealth of the country is unknown. If a Ceylon planter wants information he sends to Europe for it; but in Europe none exists. If he is asked why he goes to Europe for that which he should learn at his own door, he answers that in Ceylon nothing is known of Ceylon. That is true; and nothing will prevent its remaining true unless the Botanic Garden is well supported. Instead of cutting down its expenses, the Legislative Council should double the staff, and place more ample funds at the command of the superintendent. He then need not kill himself with work of detail, but could occupy himself with the greater duties of his office. We know that Mr. THWAITES is diligently employed in preparing a systematical account of the vegetation of the island, or a Flora, as it is called. That must be done. It is the foundation; but has never yet been accomplished. According to the *Ceylon Observer*, this work "will be so arranged that any person of intelligence can freely use it to advantage. The publication of such a book will enable us to form an idea of the botanical riches of the island, in other words, of the vegetables in it which are beautiful to behold, which are useful as food for man or beast, for arts and manufactures, such as plants producing fibres, gums, resins, dyes, oils, perfumes, and medicines of great value, or substitutes for them. Such a work will enable us to compare our plants with those of all parts of the world which have been described; and in our reading will enable us in a short time to know whether any vegetable in another country discovered to contain valuable properties exists in Ceylon, and if not, if there exist here allied families of plants some of which could be used with advantage as substitutes."

This is looking at the matter in the right light, and if the Flora is accompanied by the vernacular names of the plants, its importance cannot be over estimated. But such a work is one of enormous labour; it rests on multitudes of minute observations, which, like the foundations of a great building, are unseen by the crowd, which thinks only of the superstructure. There ought to be two or three good assistants employed incessantly in preparing these observations; instead of which, the superintendent is tied down to the labour personally. And so he must remain until the Flora is prepared; for, till that is done, nothing is done—unless desultory statements, ending in nothing tangible, can be alled something.

The material interest of this great island is as much bound up with a thorough knowledge of its plants as with an honest administration of its laws. What are its trees, and what their timber? What are its drugs, and what their action? What are its fibres, and what their strength? What its gums, and what their market value? What its dye-plants, and wherein consist their excellence? Until these questions can be distinctly answered, Ceylon may be held as a military post, but it can never be regarded as a great colony. The answers are to be sought in its Botanic Garden, for they are not to be found in any other place.

VEGETABLE PATHOLOGY.—No. XXXV.

157. The whole effect, however, in the most palpable cases of chemical works does not probably arise from the mere admixture of noxious gases with the air. A portion is imbibed by the soil, and there sometimes forms combinations of salts which are difficult of solution, and which only enter by degrees mixed with water into the nutritive juices. I have detailed in the *Gardeners' Chronicle*, for 1852, a curious case, in which many plants fell a sacrifice to the noxious gases which were given off in the course of a chemical lecture, which ended with the production of such an atmosphere as forced every one to quit the room. The plants did not, however, suffer at once, but after a time the greater part perished without the possibility of assigning any other cause than that just mentioned. And in the case of injury to plants from chemical works it is often attempted to evade the question of injury by the circumstance that trees have not perished at once, but only gradually, and that, consequently, the works themselves may not have been the cause of evil, inasmuch as the slow consumption might have taken place had the works never existed. The matter, however, is now too well understood, and the effects of such works are too constant and uniform to allow, except in cases of wilful blindness, of such sophisms having any great weight with sensible men.

158. Besides the air which constitutes the surrounding atmosphere, the soil with which the earth is covered, and which is the medium of nutrition of the greater part of vegetables, like a great sponge, contains large quantities of gaseous matter in its interstices, while the water which runs through it holds a large quantity in suspension. It is well known that the accession of air to the soil, and from thence to the roots, is no less necessary than it is to the leaves. The benefit derived from stirring the earth which surrounds a plant depends on this, and it is notorious that when seeds are difficult of germination those which have immediate access to the air by the insertion of any body into the soil will frequently germinate, while not another individual gives the slightest symptom of moving. It is not, however, to be supposed that the air which is contained in the pores of the soil is identical with atmospheric air. The effect of gas proceeding from a drain the fluid or half-solid contents of which have no immediate contact with the rootlets of a plant, was long since recorded by Sir H. Davy, and in fact is visible by the most ordinary observer; and a moment's reflection will at once bring conviction that, in highly manured land at least, the air contained in its cavities cannot be ordinary atmospheric air. When organic matters are contained in the soil, they give rise, under suitable conditions of air, moisture, and temperature, to carbonic acid and water, or, if they are azoted, to ammonia; the carbonic acid so disengaged must have considerable influence on vegetation, whether absorbed directly by the roots or discharged into the circumambient air ready for reception by the leaves. In estimating, however, the quantity of carbonic acid which can act upon the vegetation of a given surface, inquiries have been hitherto almost exclusively directed to the extremely small portion contained in the atmosphere, or carried into the ground with the moisture which falls from it, to the neglect of that which emanates directly from the soil. Boussingault and Lèwy have taken considerable pains to investigate this subject, which is surrounded by many difficulties, and they found that while in its normal condition atmospheric air contains .0004 in volume of carbonic acid, in soil, on the contrary, 12 months after the application of manure, from 22 to 23 times as much were found; and in land recently manured as much as 245 times in weight. Many other results appear in the memoir published in Annales des Sc. Nat., Jan. 1853. As the composition of soil is so different, of course no uniformity in them can be expected. *M. J. B.*

VALLOTA PURPUREA.

THERE are few plants so showy and useful as this which are so suitable for amateurs, or persons possessing but limited accommodation for plant growing. It is more beautiful than many varieties of Amaryllis, while it is not nearly so troublesome to manage; and its fine umbels of bright-coloured flowers last in perfection for weeks in a cool greenhouse.

It is easily propagated by means of offsets, which are produced freely on established plants. These should be taken off before growth commences in spring, and planted in separate pots, putting one or more into a pot just sufficiently large to conveniently admit the roots, according as the object may be to increase the number of the plants or to have useful-sized specimens for flowering as soon as possible. After potting they should be placed in a close pit, and sparingly supplied with water at the root, sprinkling them over-head morning and evening in fine weather until they emit fresh roots, when a free supply should be given at the root. When fairly established after potting, which will soon be the case, the plants should be placed near the glass and freely exposed to air on every favourable opportunity, affording them a temperature of about 50° at night, and allowing it to rise 10° or 15° with sun-heat. As soon as the pots are well filled with active roots, shift into others some 2 inches wider. During the warm months of summer the plants will do very well in a close part of the greenhouse or a cold frame; the latter, however, will be the most suitable, as the atmosphere can be kept more moist, and the plants will make finer and more robust foliage here than in the greenhouse. Whether flowers will be produced the first season or not will depend upon the age and strength of the offsets, for unless these are strong when taken off they will not flower the first season. But as the Vallota flowers under ordinary treatment towards September, and this without any particular means being used to induce it to do so, beginners cannot do better than treat their plants well during the growing season, exposing them freely to sunshine after the beginning or middle of August; and if they do not bloom the first season they will be sufficiently strong to do so the second. The plant should be more freely exposed to air as winter draws on, and the supply of moisture both at the roots and in the atmosphere should also be gradually decreased; for although it may be dried off and allowed to lose its foliage in winter, as is sometimes done, it does better when not allowed to quite die down. Therefore the plants should be wintered in an airy part of the greenhouse, and be very sparingly supplied with water, giving just enough to preserve the foliage in health.

Towards the middle of March the plants should be encouraged to make growth, by removing them to a close pit, or the warmest part of the greenhouse, and gradually increasing the supply of moisture. The same treatment as already recommended will be suitable during the growing season, except that repotting will probably be unnecessary, for the Vallota flowers more profusely when not over potted, and, of course, the plants should be placed in a dry, airy, cool atmosphere while in bloom, in order to preserve the beauty of the flowers as long as possible. If large masses are desired without loss of time, however, a moderate shift should be given in spring to such as have bloomed the previous season, until they are in 12 or 15-inch pots, which will be sufficiently large to grow splendid masses. And as it is not desirable to break up the plants oftener than can be avoided, the offsets should be removed occasionally from established masses, taking care to disturb the flowering bulbs as little as possible, and weak manure water given during the growing season will assist in preserving the vigour of such as have been grown for several seasons in the same pots. But the Vallota will flower finely in 8-inch pots, and those whose accommodation is not suitable for large specimens may with kindly treatment bloom it profusely for two or three years in this sized pot without breaking up or shifting. When it is deemed advisable to break up the specimens, in order to afford them fresh soil, which will be necessary occasionally, this should be done just before starting them into growth in spring, and care should be taken to injure the roots as little as possible, and very little water should be given after breaking up and repotting, especially in the case of large pots being used, until growth commences, as a too free supply while the roots are inactive would tend to sour and ruin the soil.

A compost consisting of about one-half turfy loam, one-third good rich peat, and the remainder decayed leaf soil, well intermixed with a sufficiency of sharp sand, will be found to answer perfectly for the growth of this plant. In potting care should be taken to secure perfect drainage, and this should be effected by the careful arrangement of a moderate quantity of crocks, and not by half filling the pots with them. *Alpha.*

SOME PRINCIPLES OF VEGETABLE PHYSIOLOGY,

BEARING ON THE CULTURE OF PLANTS.

By Professor W. H. DE VRIESE, of the University of Leyden.

(*Translated from the Dutch.—Continued from p.* 549.)

As the plant is fixed in the ground by the roots, so is the stem, with its organs, in relation to the atmosphere. From the different nature of these two situations proceeds a great difference in the development. We have already spoken above of the various forms assumed by the tissue, which we called the tissue of the cells. Among them there is one, of which here, in connection with our present considerations, we must particularly speak. They are, in fact, those cells which are met with on the surface of plants, and which we designate the cuticle. They differ in many respects from all other tissues, though we may believe that they consist of the same types. If the leaf of an Iris be steeped in water during a fortnight, this membrane will become detached from the undermost parts, or the surface may be separated from the fresh leaf with a sharp knife. We see oblong rhomboidal vesicles, which compose the flat cells of the cuticle. Further, we remark small openings or stomata, which may be compared to the pores in the skin of animals, and formed by two vesicles of a curvate shape, which unite at the end, and leave an open space in the middle. There are also in the membrane two sorts of vesicles, the oblong and the curvate. These openings in the cuticle are spread over the whole surface, except in the place of the fibres of the leaf, where they are missing.

All this is covered by another thin and transparent membrane, which covers the whole cuticle, the openings only excepted, and in which we discover lines, the marks of those which show in the cuticle membrane the tissue of the cells. If a Cabbage leaf be steeped in water for some days this upper membrane can easily be separated. It is caused in all plants by the evaporation of substances which remain in the cuticle in a fixed state.

It is impossible to enlarge on the subject of this cuticle, which presents itself in innumerable other modifications. This may be said here of the above-mentioned stomata, that it may be accepted as certain that they must be in a very near relation to the respiration of the plants, that is, the relation of plants with the atmosphere, chiefly when we consider in what a great quantity they are often found. In the space of □0,001

there are 2846 on an Orange leaf, 1000 of that of the Purslain plant, 480 on a Rhododendron leaf, 150 on that of the Oat, &c. More than three millions have been counted on a single leaf of the above-mentioned Iris.

But, however important those spores may be, certain it is that it is not by those parts exclusively that the communication of the exterior world with the interior of the plant is entertained. We are sure that each membrane of plants, and consequently also that which lies on the surface, possesses the property of admitting fluids, of whatever nature they may be, without the presence of determined openings, though the conditions which are required for it are not always known to us. It is a fact that the whole surface exhales or respires—takes up fluids and conveys them to the inner part of the plant.

In order to make our further contemplations useful to our readers, we have been obliged by these observations to introduce them into the structure and nature of plants.

It may be accepted as a truth that the vesicles or cells of the root may be at all times active, in a greater or less degree, even independent of what takes place in the other part of the plant which is above the soil. The "endosmosis," such is called the property of the cells (which contain thicker fluids) of taking up thinner ones—the endosmosis, that peculiar faculty of absorbing, takes place during the colder seasons as well as in the summer in the cells of the roots, and also in more inwardly situated cells. In other words, where there is life there must be movement also. The movement which takes place here consists of the exchange of fluids from one to another cavity of cells. That movement and the supply and exchange of substances which it necessarily brings about, is the only cause of the growth. It must, though in a less degree, take place in the parts under ground, even when the cold of the winter stops all growth and development—when the superficial contemplator does not see in nature the least trace of life. The following causes will explain how this is possible. When the earth seems to be changed into a crust of ice, the temperature of the ground at a relatively small depth is higher than that of the air. It has been proved by experiments that the temperature of the interior of trees is different from that of the surrounding atmosphere. It has been observed that even at periods when the thermometer has fallen below the freezing point, and thus when the air is cold, when water becomes ice, the inner part of the trees is warmer. Incisions were made in the trunks of trees in winter, thermometer-bulbs were inserted, and the quicksilver therein was some degrees higher than in that of thermometers hung up near the trees in the open air. The trees retain their proper degree of heat, notwithstanding all the changes in the temperature of the air. This may be explained by the generally known property of vegetable substances, chiefly of wood (and thus particularly of trunks of trees), preserving their proper temperature. Therefore, those vegetable substances are called "bad conductors of heat."

(*To be continued.*)

ORCHARD HOUSES.

I am induced to trouble you with a few remarks about orchard-house trees, as I fear a wrong impression as to the proper treatment of young potted trees of Peaches, Nectarines, and Apricots may be spread, from its being stated, at p. 551, that, "to get the wood thoroughly ripened and the flower-buds set early in autumn, the trees are plunged in beds in the open ground as long as fine weather lasts." Now, with the above-mentioned species of orchard-house trees, this is just the reverse of the treatment they should receive; for every gardener knows that the young shoots of Peach trees are very tender in spring, and apt to receive injury from cold and wet weather—they cannot therefore be ripened too early in the summer; and to obtain this result the trees should be placed under glass early in March, and remain there all the summer. They may be removed to the open air towards the end of August, and remain out during September and part of October, if the house they have occupied is required for other purposes, and they will not receive any injury, but to a certainty no good can accrue, for they always ripen their shoots perfectly under glass when abundance of air is admitted.

It is very interesting to observe the perfect success with which Peaches, Nectarines, &c., can be cultivated in pots. On the 12th ult. I visited the garden of Thomas Bewley, Esq., at Blackrock, near Dublin, and was much interested with his fine collection of potted fruit trees; about two years since he built two lean-to orchard houses 21 feet by 12 feet, at a very cheap rate, —I think for about 16*l.* or 17*l.* each, with the benevolent motive of showing to his numerous neighbours with gardens without garden walls, that Peaches and other stone fruits could be cultivated without their aid; his success is perfect. I have never seen trees in more perfect health and their fruit in finer condition. Several trees were quite pictures, and full of bright-coloured, full-sized Peaches (measuring from 8 inches to 10 inches in circumference) and Nectarines. This was to me the more extraordinary, for, like the trees mentioned by your reporter as growing with Messrs. Lane, they were all in 11-inch pots. I have at this moment, in a span-roofed orchard house, 70 feet by 20 feet, upwards of 100 trees of Peaches and Nectarines from four to six years old, many of them laden down with fruit, *i. e.*, I have suffered them to bring to maturity from three to five dozen each; but my trees are all in 13-inch pots. The succession of fruit given by the trees in an orchard house is of great import; but very few gardens can afford the necessary space on walls for the very early and very late Peaches, as they are to a certain extent of secondary quality; for instance a large tree against a wall of the Red Nutmeg or Petite Mignonne Peaches would give more than requisite; but a potted tree or two of each sort would give a few dozens, and occupy but little space. I commenced to gather Peaches from my orchard house trees (no fire heat employed), on the 24th of July, and I hope to have them till the end of October. The first to ripen was the white Nutmeg Peach; this sort is now very rare, it is not larger than a middle sized Walnut, and interesting from its delicate flavour and extreme earliness. Then followed the red Nutmeg, a little larger and of a richer flavour than the Petite Mignonne or Double de Troyes, a sort very scarce, but desirable for its earliness, good flavour, and productiveness. My tree, five years old, a pretty standard, with a stem about 3 feet in height, in a 13-inch pot, was crowded with fruit, and upwards of 100 ripened; they were the size of Green-gage Plums, and very juicy and good; the Early Ann ripened its fruit about the same time, and then followed the Early Grosse Mignonne, one of the best early full-sized Peaches at present known—it is exactly like the well-known Grosse Mignonne (perhaps a trifle smaller) and ripens a fortnight earlier; the Early York, an American Peach, and excellent, ripened nearly at the same time; the Noblesse, Royal George, and a crowd of good Peaches, are now following these early varieties; good early Peaches are so desirable that I have spared no pains to procure them. Accordingly I have imported from all parts of the Continent all the "Précoces and Hatives" to be found, and from America all the "earlies." I have as a matter of course met with many disappointments, for many with "précoce" attached to their names have proved October Peaches, and so on; but I have been amply repaid for my trouble by discovering two or three fine early Peaches. How much has pot culture assisted me in this! By the tedious process of planting new sorts of Peaches and Nectarines against walls I might have waited many years before I could have proved their qualities. When cultivated in pots in an orchard house, two years for the most part suffice for this. I have at this moment, to use the French mode of expression, the most perfect school of Peaches and Nectarines ever seen in so small a space; and a promenade in my orchard house, in which I grow my bearing trees, is most interesting. The fine, healthy foliage, ruddy, delicious fruit, and exquisite perfume, are in their way perfect; and then, while tasting and testing with such books in hand as Duhamel, Lindley, Le Bon Jardinier, &c., the trees and the fruit acquire a fresh and delightful interest.

I can now account for the numerous synonymes and incongruities about Peaches and Nectarines from Duhamel to the present day; thus the Alberge Jaune of Duhamel, and the Rosanne, are both described as giving small flowers and fruit with yellow flesh. Lindley describes the Rosanne as differing from the Alberge in having reniform instead of globose glands; I have never seen this yellow-fleshed Peach with reniform glands, but I feel assured that Peaches with this slight difference can be raised from stones of the same sort, and that they are not distinct enough to be worthy of a name. I have at this time seedlings from the Pitmaston Orange Nectarine, some of which have globose glands, like the parent stock; some reniform or reniformish, and some with deeply serrated leaves and glandless; all that have borne have given fruit of the same orange colour as the original, equally good and of no particular distinctive characters. Orchard-house trees give such facilities for fertilising and crossing the different varieties of Peaches and Nectarines, that I feel a new era in their culture is approaching; we shall, I anticipate, have an entirely new race of early and late Peaches and Nectarines; the Stanwick Nectarine will, with the latter, do us good service. You will, perhaps, remember sending me, at different times, some four or five years ago, four fruit of this (the Stanwick) Nectarine, to taste and to give my opinion on; I planted all the stones, and raised four trees, numbering them 1, 2, 3, and 4; they are all growing in 13-inch pots, and all bearing fruit this season; in habit, leaves, and flowers, they are exactly alike, but in fruit they differ. On the tree No. 3 there are 12 fine fruit, larger than those on the other trees, and without the least crack or blemish; while those on the parent stock tree, and on the other seedling trees, are inclined to crack. I therefore hope that in two or three generations, and by recrossing, we shall make this fine Nectarine fit for our walls, and a valuable acquisition.

Very few cultivators are aware of the large quantity of air required when the trees are in bloom: in March they should have all the air that can be given both night and day, when the weather is mild; and the same from the time the fruit commences to swell and colour, till it is fully ripe, as its flavour is much influenced by the plentiful admission of air. I observed in the orchard-houses of Mr. Bewley, before alluded to, some fine Apricot trees in vigorous health quite bare of fruit; they had blossomed abundantly, but had failed to set their fruit. On closely inquiring into their treatment I found that the houses had been kept too close while the trees were blooming, and Mr. Bewley described the atmosphere in his neighbourhood as peculiarly soft and moist; this would prevent the action of the pollen, and lead to failure in the crop. The soft moist air in Ireland should be borne in mind in erecting and managing orchard-houses in that country; means for giving a greater abundance of air than is necessary here must not be omitted, and the giving of abundance of air night and day must never be forgotten when the trees are in blossom. *Thomas Rivers.*

Home Correspondence.

Rain Gauges.—As I have a file of your Paper from time to time from a friend, it is only a day or two ago that I perceived the wish of your correspondent "T. S. P.," that I should give my reasons for thinking that his observations contain "internal evidence of error." A rain gauge, as "T. S. P." seems to be aware, indicates a larger fall of rain when placed on the ground, than it would if suspended vertically over the same spot. I find, upon good authority, that for a height of 42 feet 6 inches an addition of a fourth, or at least a fifth, must be made to ascertain the quantity which would have been indicated if the gauge had stood upon the ground. If, now, the quantity registered by "T. S. P.," as shown by the 5-inch gauge, when placed at that altitude receive such an addition, it will exceed the amount indicated by the 8-inch gauge when placed in the ground. Surely, then, this is conclusive evidence of causes of error at work quite independent of the relative size of the gauges. No one could undertake to offer any satisfactory explanation of this, nor of the discrepancy between the gauges when placed side by side, without an actual survey of the locality; but I should imagine that a dockyard with high roofs and large sheds creating many lateral draughts and eddying currents of air, must prove an unfavourable place for accurate observation; and whilst I allow, as indeed I implied in my former communication, that a 5-inch gauge is too small to yield results that will always be trustworthy, I think it remains to be proved that a 10-inch is not quite large enough to ensure accuracy, if proper care be taken to eliminate other causes of error. *John Slatter, Rose Hill, Oxford.*

Page and Co's. Anti-blight Composition.—We cannot help expressing our regret at the harshness of the expression in this day's number (Aug. 26) to some correspondent upon the matter of our "Blight Composition," which, in fact, virtually closes your columns against the subject. We are vexed at this, more particularly because we have seen similar remarks in previous numbers, but toned down to "anonymous communications," "gardeners of your acquaintance," &c., while for several successive weeks we have read half a column, quite advertising another remedy lately advertised. This at first sight would lead us to believe that your columns are made the medium of partiality, but we would much rather dispel than entertain that idea, because we do not consider that the *Gardeners' Chronicle* could be so faithless to its professed principles. We beg to furnish you with the names of a few gardeners, some of whom, we imagine, are known to you, and also the fac-simile of our advertisement inserted in the spring; but if all these go for nothing without a personal trial, we shall be but too happy to place some of the composition at your disposal; and we confess that the reason we had not done so before was that we did not wish to be troublesome. We have now had three years' trial of the composition, this year's sale being treble that of the other two; and we are glad to observe that we have been favoured by an excellent account of it by very many first-class gardeners this year, whose testimonials we hope to advertise in the *Chronicle* next spring. We have now 30 letters before us received within the last two months, and they all agree as to its merits. In fact, there is not one instance in which it has not succeeded beyond our expectation; but attaching, as we do, much importance to editorial remarks, we anticipate no good from the note in question. *B. Page & Co., Oxford Street, Southampton.* [We have intended no incivility to Mr. Page; but we cannot insert statements in favour of his or anybody's "composition" without knowing the persons from whom they come. That is essential. As to the particular substance in question, we know nothing about it. We can, therefore, only repeat that if it is sent to our office it shall have a fair trial.]

Gnats.—Mr. Fortune found in China something burned to drive away mosquitoes. Can any one recommend a sure means of expelling gnats from a sick bedroom? *R. A. H., Aug.* 28. [We are sorry to say nothing is known of the stick used in China for this purpose. It is supposed to be the "Joss-stick," a kind of pastile.]

Ferns.—Rockwork for Ferns should consist of two or three formations; for instance, Asplenium. A. nigrum must have some magnesia, and A. marinum cannot be kept alive without it. Brick clinkers or carboniferous limestone will not alone do for many species. The Hymenophylla, again, require the very minute silex of the "forest range of Sussex" to keep them alive for a week even, and then they must have a cave in which to grow; without this last (a cave) no Fernery is complete. I am about to add one, open only to the north, and screened from winds on that side, as they are the most drying; it will be built of rock, and covered with earth outside, with a small pool within. *Somerset.*

Pruning and Training Vines.—The following is my mode of pruning and training Vines; and as it has been condemned in several important particulars, by one or two of my brother gardeners, without any proper reason having been given for so doing, I shall feel obliged by any of your Vine growing correspondents pointing out to me where my practice is at fault. I consider the best mode of pruning, with a view to produce a good general crop of fine well-flavoured fruit, to be

the spur system, which is practised by most of our best Grape growers. The first season after planting, I train up one shoot to each rafter, stopping at the first joint all laterals, and cutting away the tendrils. When the shoot has attained say three-fourths of the length of the rafter, I cut away the bottom laterals, and so on all the way up as the wood hardens. This season I should not stop the shoot at all, but continue to let it run along the top of the house, so as to obtain as long and strong a shoot as possible. The second season I prune down to three or four eyes from the bottom of each rafter, and allow one bunch of fruit to ripen, in order to prove the kind. I then train the uppermost shoot to the rafter, managing the same way as I did the first season, except that I stop it by pinching the end off near the top of the rafter, to strengthen the lower buds; the two bottom eyes I stop at the third joint, to make spurs. If the Vines are strong, as they ought to be, they will push again; then I stop them at the first joint, repeating this as often as they shoot again. I then tie them so as to give the leading shoots all the benefit of the sun and air. The third season the Vines should be very strong, with short joints and good buds; and I expect this season to have a few bunches of good fruit, and I prune accordingly. If the wood be firm and of a good brown colour, I cut at about one-third the length of the rafter, which will be in most cases 6 feet or upwards. I have then something like 10 buds, from each of which I expect a bunch of fruit. More may show, but that number is quite sufficient for the third year, as the Vine has to make wood as well as bear fruit, a fact which, I am sorry to find, a great many Grape growers do not bear in mind. I then train the top shoot up the rafter again, repeating the operations of removing tendrils, stopping laterals, &c. The side shoots or spurs I stop at the joint which shows fruit, and I only leave one bunch on each spur. This I recommend as a general rule every year afterwards. I then tie the side shoots at proper distances from the centre, so that I have two rows of bunches, one on each side. The fourth season I bring up the spurs to two-thirds the intended length of the Vine, following the system I carried out during the third season, only if any of the shoots are weak I cut off the bunches of fruit so as to strengthen the spur. The fifth season the shoot extends the length of the rafter, so in that time I have all the rafter clothed with fruit-bearing spurs, after which all they require is to cut through the second bud every season. I rarely ever leave more than one bud to each spur, though some cultivators leave two; but in that case the spurs soon become long and unsightly, and the further the bud is from the main stem, the weaker it will be. When the spurs get too long I train up a young shoot from the bottom, and the following year I cut out the old shoot and manage the young ones exactly as I would a young Vine. I do this to every other Vine, if the sorts are good, or every third, just as I can spare them. *R. B.*

Potatoes.—I had in my garden a piece of Potatoes, which were just beginning to die off as the disease appeared. As soon as I discovered the evil I cut off the haulm, and about a week after took the tubers up, laid them in a heap in the garden, and covered them over with bags, not a little pleased in having such a lot of fine sound Potatoes as I have not had for years. Looking at them a few days after, I was much surprised to find that they had taken the disease, and were going very fast. I then had them sorted, but was pleased to find the disease nearly confined to the outside of the heap, so that out of 15 bushels I have about 10 bushels, I hope, saved. As a proof that they had caught the disease after being taken up, I would just say that upon digging the ground I found that those which had been missed were nearly all sound. *W. Bentall, Paper Mills, Halstead.* [They were taken up before they were ripe.]

Material for Paper.—Could not the bine of Hops be made useful for paper making? In this neighbourhood it is produced in great quantities, and appears to be an incumbrance to the farmer. Large quantities of Asparagus also are grown hereabouts. Would that answer for paper-making? *Diamond.* [We should think both the Hop and the Asparagus would furnish good materials. Cannot you get the paper mills at Maidstone to try the former at least?] Among other things I have tried Nettles for paper-making, and I find that they make a strong paper, but with my engines (common rag engines for brown paper), I cannot beat out the woody parts. If you happen to know a paper-maker who has used them, and could inform me what kind of engine is employed for the purpose, I should feel obliged. It would be a great advantage to get them into use for the purpose, now that paper material is so short; and cultivated land need not be wasted to grow them, as a large supply may be had from the hedges and wastes, and employment given to many now idle lads in collecting them. *W. Bentall, Paper Mills, Halstead.* [Perhaps some correspondent will be able to answer this inquiry.]

Heliotropes, owing to their agreeable fragrance and cheerful-looking flowers, are always especial favourites in the flower garden, and when successfully cultivated in pots they are very ornamental in a greenhouse. The only fault belonging to them as bedding plants is their being so tender as to be often destroyed by frost early in the season, while other occupants of the flower garden continue in perfection. Notwithstanding this, however, they must still be cultivated, both out-doors and in, more especially as the varieties have become so greatly improved of late, both in habit of growth and richness of colour. Voltaireanum nanum is one of the very best, having high coloured flowers, and a dwarf, compact habit, as have also corymbosum and Souvenir de Liege; all these answer either for bedding or pot culture. Cuttings taken off early in August, and placed in an old Melon or Cucumber frame, in a mixture of leaf-mould, sand, and garden soil, root freely. They should, however, be inserted rather firmly in thoroughly well drained 6-inch pots, placing a portion of the rough siftings of the soil over the crocks, to keep the mould from being washed down amongst them. Many complaints have at different times been made with respect to their damping off. No doubt, if taken off too late in the autumn, or put in badly drained pots, this may happen; but if put in early in August, or early in spring, not one in a hundred will fail. As soon as they are sufficiently rooted, pot them singly into 3-inch pots, in a mixture of leaf-mould, loam, and sand, and replace them in the frame, keeping them rather close and shaded from the midday sun until they have become well established, frequently sprinkling them over-head with a fine rosed watering pot. When well rooted remove them to the most convenient place for wintering them in; and if other accommodation cannot be afforded, they may remain in their cutting pots until spring. Their heads should frequently be pinched out to keep them bushy; for those who have but little convenience for housing bedding plants will find it best to keep a few old plants in pots, and by placing them in a little bottom heat, about the end of February, they will produce abundance of cuttings, which will strike freely if placed in a slight bottom-heat. Care should be taken to harden them off well before they are too fully exposed to the open air, and as a rule they should always be the last plants bedded out. A plant or two should also be turned out in the borders of the conservatory, or in some corner of the greenhouse, to furnish flowers for bouquets. As a pot plant the Heliotrope is valuable both for its fragrance and colour, and under good management the above named varieties will form handsome specimens. Young plants for this purpose should be started in a moist gentle heat about March, and liberally shifted into thoroughly drained pots, when found necessary, frequently pinching off the ends of the shoots, to keep them dwarf and compact. The lower shoots should be tied down to the edge of the pots, and the remainder should be neatly regulated. The plants should then be moved to a cool and more airy situation, and the syringe should be freely used in fine weather, and they should also be liberally supplied with water during the summer months, by which time they will form large handsome specimens, and should be placed in the greenhouse, where they will remain a long time in perfection. Manure water should be given freely during the blooming season. *E. B.*

Notices of Books.

Soyer's Shilling Cookery for the People (Routledge) will be found useful in the dwellings of the lower classes, and may be read advantageously in the kitchens of people in easy circumstances. According to the author, he has reduced his instructions to the simplest form of which they are susceptible, and omitted everything not likely to be wanted by the buyers of shilling books. So far as we can judge, he has kept within these limits, and made his directions plain to the meanest capacity, even although he does talk of bouilli, and marinading, and prefers telling a maid of all work to make "incisions" instead of cuts, and to have ready a "sharp" oven instead of a quick one. These, however, are small matters. The intention of the book would recommend it to favour, even if its blemishes were greater; for any competent person who endeavours to teach our poor, and, let us add, our ignorant domestic servants, how to treat economically and skilfully the food at their command, deserves public gratitude. The great difficulty in the way of all teachers of the art of cooking is that in so many cases masters and mistresses are as destitute of taste as their servants are of skill; and are satisfied with any rude mess that is not absolute garbage. Yet, even in these cases, domestic talent would, we imagine, be appreciated in the long run even by the coarsest feeders.

M. Soyer hints at the probable advantages of establishing schools for cooking. The idea is excellent. Some of the occupations of our national and parochial female schools might be advantageously replaced by a strict culinary drill, which, whatever it might cost—and it would be very little—would be more likely to render the girls useful servants and good wives than any other part of their education. Were such a system established it would be easy to have travelling district teachers who would visit the schools frequently, give instructions, watch progress, correct errors, and proceed from simple to more complicated subjects. We have no doubt that M. Soyer would be able to suggest the mode of carrying out such a scheme. In the meanwhile his own powers of teaching may be judged of by the directions he gives for Carthusian cooking, or what the French call *à la Chartreuse.*

Carthusian, or Chartreuse, in French cookery, means any article of food, such as meat, game, or poultry, so surrounded by vegetables that even a vegetarian would be deceived with its appearance, while sitting at dinner, and would not find out his mistake until helped with some of the dishes.

111. *1st Lesson.*—If in winter, cut crossways, in four, a large Savoy Cabbage, or two small ones; take off a few of the outside green leaves; wash the Cabbage well, then put on the fire either an iron pot or a three-legged black pot; put in about 3 quarts of water; when boiling, add your Cabbage, boil them for 10 minutes, or a little longer, then drain them in a cullender or cloth, pressing out the water; cut away the stalk from each piece, then chop your Cabbage, though not too fine, letting it weigh about 2 lbs. When thus prepared, which will be our proportion of vegetable to 1 lb. of meat, previous to chopping them upon the board, season with one tea-spoonful of salt, that is, if salt meat be used; two ditto if the meat be fresh; one teaspoonful of pepper at all times.

Suppose we select for this, our first lesson, three middling-sized pigs' tongues. You have put them to boil with your Cabbage, then cut them through lengthways, then place at the bottom of your pan about an inch deep of Cabbage, and half an inch round the inside of the pan, placing your meat in the centre, thus making the meat invisible to the eye when turned out of the pot; when filled, add a quarter of a pound of butter or dripping, two wineglasses of vinegar, if English, or one if French, 1 gill of water; set it on a brick, placed in the oven, for two hours; then open your pan, and place over your Cabbage a tea saucer; press out all the gravy in a cup, pass a knife round your pot, then put a dish over the mouth inside downwards, turn the pot or basin upside down, when your carthusian will turn out like a pudding: pour the gravy or bread crumb sauce over, and serve.

112. *2d Lesson.*—The above may be done in pudding-basins, or in deep oval pie-dishes, and either baked slowly, as above, or steamed as puddings, but as there will be no cover to it, put over a cover of pudding-paste (see No. 319); fix over as for pies or puddings, making several small holes in the paste, and only putting half the moisture in. When done, remove the paste, which put on the dish you intend to serve it in; press out the gravy, turn your carthusian out on the paste, already laid on the dish; then proceed with the gravy as above described; Red Cabbage is also very good, but requires double the quantity of vinegar, and more pepper; proceed the same; they require boiling in water about 30 minutes, if at all large, and rather old, as they are at Christmas.

113. *3d and General Lesson.*—Having given you the base or foundation in the above receipts on animal food, I will now in a few words describe the extraordinary variations that can be made with this favourite dish of the best judges of good cheer,—viz., the monastic fraternity of olden times.

Instead of the above, you may use pigs' feet, cheek, pickled pork, bacon, ham, liver of all kinds, previously fried, or partly so, sausages, black-pudding, or salt beef, previously boiled and cut in slices, or any part of fresh meat previously roasted, any remains of poultry or game may be done the same by cutting them in slices; if, however, they have not been previously cooked, they will take two hours instead of one. Pigeons, partridges, and all kinds of small birds, may be put in rows, only they should be larded or stuffed previously.

This will give you an idea of the various ways in which this dish can be made, as far as animal food goes.

THE second edition of *Mrs. Catlow's Popular Conchology* has been lately issued by Messrs. Longmans in the form of a handsome volume of 370 pages in small 8vo, with numerous good woodcuts, partly new, and partly reproduced from the first edition. In arranging the matter the system of Philippi is now followed, instead of that of Lamarck, which gives the work quite a new character, and forces the student to look to the animal as the basis of classification, and not to the shell itself—a much more scientific method, but unmanageable in the cabinet, and without much experience, unless it is combined with the Lamarckian. In books for learners difficulties of every kind should be removed, as far as possible. This important point does not appear to have engaged the attention of the authoress, who scarcely employs analytical tables, useful as they would be in so complicated a subject; and when she does employ the process, is far from being successful. For instance, in what is called a systematic arrangement of the whole contents of the work at p. 23, there is no explanation of the characters by which the classes, orders, and families, are known; there is no skilful contrast of distinctions, nor is it even shown to which classes the univalve and to which the bivalve shell belongs. Considering how easy analysis would have been, and how greatly it would have helped the learner, we cannot but regret that it should have been disregarded in a volume otherwise deserving of praise, and profusely as well as exceedingly well illustrated. Such matters are trifles in the eyes of the learned, but they are of the greatest importance to the untaught, and the neglect of them by popular writers has contributed more than any other circumstance to impede the study of scientific natural history by the mass of mankind. Linnæus knew how to deal with such subjects, and hence the universal and long enduring popularity of his admirably managed classifications, in which he always rendered simple what was complicated. Too many writers now-a-days succeed best in rendering complicated what is really simple, or might be so. Notwithstanding the great fault we have thus pointed out, and which is common to Mrs. Catlow with so many naturalists of the highest reputation, we cannot dismiss the lady's volume without expressing our belief that it will prove to be the general handbook of collectors of shells in this country.

New Plants.

81. CALYPTRARIA HÆMANTHA, *Planchon and Linden.*

"This is by far the finest Melastomad which has ever been brought to Europe, not even excepting the Medinilla magnifica. The figure in the 'Flore des Serres' will enable the reader to judge of the merits of the plant, without rendering it necessary to speak of the size and abundance of its brilliant flowers, or of the blood-red colour to which it owes its native name of Sangre de toro (Bull's blood). It is a bushy freely flowering shrub, with a rusty down all over its branches, petioles, peduncles, pedicels, calyx, and the lower surface of the leaves. The leaves themselves are extremely thick and coriaceous, and are remarkable for their beautifully reticulated nerves. The racemes of flowers are as much as 2 feet in length, and bear each 15 or 20 flowers, with fleshy persistent petals, and a calyx opening into the shape of a soap-box.

"It was discovered in 1847 by Mr. Schlim upon the subalpine slopes of the far-famed Paramo de Cachiri, and has again been met with by the same traveller in the province of Ocaña, whence he has sent home both suckers and seeds. It grows in a clay soil, at a height of from 5000 to 7000 feet, and in company with several other beautiful plants which have also reached us, and to which we hope shortly to draw attention. Amongst

them are Purdiea nutans, with gracefully bending spikes of white bracts and delicate pink flowers; Gonocalyx pulcher, a pretty little shrub with thick fleshy nearly orbicular leaves, and numerous bright red tubular flowers; Clethra consimilis, with leaves like Vaccinium, and pretty white corymbose flowers; several magnificent Bejarias; the pretty Begonia miniata, introduced last year, and already known for the ease and abundance with which it flowers; and lastly, several very fine species of Lisianthus, which we succeeded in raising from seed, but which afterwards died in spite of our utmost care." *Linden's Catalogue*, 1854.

There is a specimen of this in our herbarium, from Mr. Linden, which enables us to verify the exactness of the foregoing account to a great extent. The figure in the *Flore des Serres* represents it as being one of the most glorious of plants. It is said to hold its petals, contrary to the habit of Melastomads, and if so, it will far eclipse every crimson flowered species in cultivation. For exhibiting it will rank with Indian Azaleas or crimson Rhododendrons. The high price at which it is about to be "let out," viz., 50 fr. each, shows what a value is put upon it by its spirited importer.

Among Melastomads the genus is remarkable for having the operculate calyx of an Eucalyptus, but buried in ferruginous felt.

82. Begonia opuliflora. *Putzeys.*

"This remarkable species is as beautiful as any of the genus, and will no doubt become a favourite amongst the many persons who admire this interesting family. Some notion of the plant may be obtained by imagining a small bush with thick shining leaves, covered with heads of flowers looking something like those of the common Gueldres Rose (Viburnum opulus), but of a more delicate texture and of a much purer white, and forming an admirable background to golden yellow stamens. The species was discovered by M. Schlim in the cold regions of the province of Soto (New Grenada). Price 15 fr." *Linden's Catalogue*, 1854. We know nothing of this, but it seems to be a desirable acquisition.

Garden Memoranda.

Palace Gardens, Hampton Court.—In no previous season do we recollect having seen these in better condition than they are at present; and that their noble avenues, broad gravel walks, closely shaven verdant lawns, and shady retreats, are appreciated by the public, is evident from the numbers of visitors who daily frequent them. The flower beds are just now at their best; among them are famous masses of Lee's floribunda, integrifolia, and amplexicaulis Calceolarias; Mountain of Light, Flower of the Day, Tom Thumb, Frogmore, and Fair Helen Geraniums; the variegated and blue Mexican Ageratums; the Globe, Riccarton, and Carolina Fuchsias; the dwarf purple flowered Dahlia zelinda, which, when grown on poor soil, does not rise above a foot in height, and is very pretty; variegated Alyssum, quite a compact mass of snowy blossom; together with beds of Robinson's Defiance Verbena mixed with Mangles' variegated Geranium; charming clumps of Clove Carnations, and of Rosa Devoniensis. The latter is found to bloom beautifully here every season, and is much admired, as is also the Souvenir de Malmaison. Surrounding the lawn are several fine pillar Roses, which, when in bloom, are striking and handsome. They vary from 12 to 15 feet in height. The sorts are Brennus, Chénédolé, Coupé d' Hébé, Lamarque, Duchess of Sutherland, Madame Laffay, Fulgens, Mrs. Elliot, and William Jesse, &c. The wall along the side of the broad walk from the "Flower-pot Gate" to the river, is covered with Roses, Honeysuckles, Chimonanthus, Ceanothuses, Magnolias, Jasmines, and Clematises, &c. These are not so trimly trained as to render them stiff and formal; but are allowed such freedom of growth as gives them a luxuriant and graceful appearance. In the "fountain court" the basin is encircled with large scarlet Geraniums in pots, consisting of Tom Thumb, Flower of the Day, and standard Fuchsias, which give to this quiet square a gaiety which it never before possessed. The way in which Mr. Neil, who is gardener here, winters these specimens is as follows:—As soon as frost sets in he packs them closely together in a cold frame, and keeps them perfectly dry till spring, when he fresh pots them, and places them in a gentle heat, in which they push rapidly and soon come into flower, and continue so all the season.

As regards the walks, they are in beautiful order—a condition in which they are maintained by means of boiling salt water applied to them, as often as they require it, from a machine something like that employed for the same purpose by Mr. Fleming. It is an oval copper cylinder encased (except the top) in iron, so as to have a flue all round it; it holds about 37 gallons of water, which is kept boiling by means of a furnace below, and it is spread over the walks from a perforated pipe like that attached to carts for watering streets. It is set on low broad wheels and is easily drawn by a couple of men, and all admit that its working and efficiency are most satisfactory. It was made, we were informed, in Kingston, from a plan furnished by Mr. Neil, and cost about 20*l.*

The large Vine has upwards of 1600 bunches of Grapes on it this season, and appears to be in excellent health. A new greenhouse, aërated by means of Moore's patent ventilators, has lately been put up for the accommodation of tender plants in winter, and we observed that the gold and silver fish-pond and canal have been cleaned and otherwise put in good condition.

FLORICULTURE.

Wintering Verbenas.—Having succeeded in keeping the different sorts of Verbenas in small pots through the winter, when my neighbours have failed, I beg to state the method I adopt. In the first or second week in July I strike in 3-inch pots as many cuttings of the different kinds as I require for filling the beds in the following year, about 6 pots of a sort being sufficient. Early in August, the pots being filled with roots, I prepare as many boxes, two feet square, as I have sorts, filling one-third of each box with broken tiles, and the rest with one part sand, one leaf mould, and two parts good rich loam. The plants are then placed in them at equal distances apart, and the shoots being pegged down they soon take root all over the box, and form one mass. The boxes are placed in a cold frame during the winter, and the lights are thrown off, except in wet or frosty weather. Early in the spring they begin to make young shoots, which I pot in 3 inch pots, and strike in a Cucumber frame; these will be ready to plant out by the end of April, at which time the boxes are turned out, one side being removed, and the mass planted in the centre of a bed. The bed is then filled up with the young plants from the 3 inch pots; those out of the boxes, being oldest and strongest, take the lead and keep it; thus the plants in the centre of the bed, being the highest, a striking effect is produced. *G. F.*

Hollyhock Exhibition.—At the late extensive exhibition of this beautiful flower, which took place at the Surrey Zoological Gardens, the following prizes were awarded:—Spikes, 11 dissimilar varieties: 1st prize, Mr. Bircham, with Solfaterre, Yellow Model, Felicia, Pourpre de Tyre, Unique, Comet, Criterion, Lilac Model, Queen of Denmark, Brennus; these were large, clean, even, and of first-rate quality. 2d, Mr. W. Chater, with Spectabilis, Admirable, Lady Braybrooke, Sulphur Queen, Walden Gem, Meteor, Joan of Arc, Pourpre de Tyre, Hon. Mrs. Ashley, Comet; 3d, Mr. Turner, with Orestes, Duchess of Sutherland, Pourpre de Tyre, Yellow Model, Souvenir, Eugenia, Eva, Emperor, Walden Gem, Mrs. Forster, Charles Turner; 4th, Messrs. Paul, with Pourpre de Tyre, White Globe, Lizzy, Magnum Bonum, Charles Baron, Beauty of Cheshunt, Sulphur Queen, King of Roses, Metropolitan, Eugenia, and Aspasia. Cut blooms, in 24 distinct varieties: 1st, Mr. Turner, with Agricola, Lizzy, Walden Gem, Susannah, Charles Turner, Emperor, Purpurea, General Bem, Pourpre de Tyre, Orestes, Sulphur Queen, Sir David Wedderburn, Felicia, Hope, Souvenir, Pillar of Beauty, Hon. Mrs. Ashley, Shaded Model, Beauty of Cheshunt, Eleanor, Black Prince (new), Eugenia, Duchess of Sutherland, Ovid; 2d, Mr. Chater, with Enchantress, Safranot, Black Prince (new), Rosy Circle, Brennus, Mulberry Superb, Golden Fleece, Lady Neville, Seedling, Charles Lidgard, Souvenir, Comet, Eugenia, Seedling No. 2, Hon. Mrs. Ashley, Elegans, Sir D. Wedderburn, Lilac Model, Seedling Yellow No. 1, Walden Rival, Gen. Bem, Emily, Pourpre de Tyre, Sulphur Queen. Private growers—Spikes in 7 varieties: 1st, Mr. Roake, with Julia, Pourpre de Tyre, Sulphur Queen, White Globe, Walden Rival, Beauty of Cheshunt, Hon. Mrs. Ashley; these were very fine, with large flowers. 2d, G. Holmes, Esq., with Elegans, Penelope, Pourpre de Tyre, Lemonade, Warrior, Meteor, Challenger. Twenty-four cut blooms, in 12 varieties: 1st, Mr. Roake, with Seedling No. 1, 1854, Ovid, Joan of Arc, Walden Rival, Pillar of Beauty, Hon. Mrs. Ashley, Charles Lidgard, Julia, Pourpre de Tyre, Souvenir, Shaded Model, Sulphur Queen; 2d, Mr. Long, Watford, with Pourpre de Tyre, Yellow Model, Hector, Emily, Sir D. Wedderburn, Joan of Arc, Comet, Orestes, Susannah, Gen. Bem, Shaded Model, Eva. The prize for the finest spike was awarded to Mr. Bircham, for a beautifully grown Mrs. Ashley; it was, however, very closely contested with a spike of Lady Braybrook, exhibited by Mr. Chater. The best single bloom was exhibited by Messrs. Paul, who produced Beauty of Cheshunt. There was not a large number of seedlings; the judges selected Bircham's Purple Perfection as the best; it is a full-sized, finely-shaped flower, in the way of Pourpre de Tyre, but more purple. Mr. Bircham sent several others, all possessing more or less merit. Schamyl, a dull bronze buff, was awarded a Certificate. Mr. Bircham also received a Certificate for his Empress Primrose. From the same grower we also noticed Jenny Lind, a good light kind, and Lemonade, a beautiful smooth flower, of a pale canary colour, with purple at the base, but too "pockety," as it is termed. Mr. Chater sent a large fine yellow (Sulphur No. 1), which will doubtless prove an acquisition. In the collections, but not shown as seedlings, were some fine flowers, seedlings not out, the best of which was Walden Rival, raised by Mr. Roake, a mottled orange, quite new in colour, and of the finest quality. Julia, by the same raiser, another mottled orange, is still more attractive in colour. Solfaterre (Bircham) is a large clear Primrose or pale yellow, good in the spike, and has full close flowers. In addition to Hollyhocks, there was a good exhibition of miscellaneous plants and cut flowers.

National Floricultural Society, *Aug.* 24.—Messrs. Paul exhibited a good collection of seedling Hollyhocks, amongst which was a bright carmine sort of first-rate form, full size, and good substance, named Lord Jocelyn. This received a first class Certificate. Dahlias, seedlings, came from Mr. Keynes of Salisbury, Mr. C. J. Perry, and Mr. Church, of Kingston; two exhibited by Mr. Keynes—Comet, a fancy variety, and Scarlet Perfection—and one of Mr. Church's, named Royal Albert, were certainly good varieties, which, doubtless, would have received some award had more than three blooms of each been shown. A very free blooming new Fuchsia, named Thalia, came from Mr. Turner. It was of good habit, the tube, &c., waxy white, slightly tipped with green, and it had a deep rose corolla. This received a Certificate of Merit. We noticed some nice blooms of a bright rose-coloured bedding Geranium, Cerito, from Mr. Smith, of Hornsey Road; but owing to the plant not being exhibited, no award could be made. Three very pretty seedling Achimeneswere produced by Mr. Parsons, of Welwyn; blooms of a fancy Geranium, named Sidonia Carminia, shown by Mr. Townsend of Notting Hill, appeared fully to confirm the reward it received in June last, when exhibited by its raiser, Mr. T. Latham, of Dover. Cut flowers of two seedling bedding Calceolarias came from Messrs. Youell, of Yarmouth, and of Fuchsia Duke of Wellington, from Messrs. Moore, of Birmingham.

SEEDLINGS.

Gloxinias: *W J E* and *J A F*. All very handsome, but (as far as can be judged from bruised specimens) not more so than kinds, possessing the same colours and forms already in cultivation.

Miscellaneous.

The Grape Vine (Vitis vinifera) must, as already observed by Pliny, be ranked amongst trees, on account of the prodigious size it will attain. This may be more especially observed in the Maremma, where it grows wild in the greatest abundance. It appears to be there, as in other parts of Southern Europe, truly indigenous, extending from thence over the greater part of South-central Asia, for the Vitus indica; on the testimony of the more recent Indian botanists, is by no means specifically distinct. From these wild Vines have evidently been raised all the innumerable varieties cultivated over the greater part of Europe, Asia, and North Africa, and now carried out to all parts of the globe where the climate will admit of it. But the period when it was first taken into cultivation is lost in the obscure ages of antiquity. We read in the Genesis that after the flood Noah began to plant the Vine; the heathens ascribed its first introduction to their fabulous heroes or divinities, Diodorus Siculus to Osiris, Servius to Saturn, and in the most ancient times Italy was called Œnotria from the wine that it produced. We have already observed that the varieties of the Grape are most numerous; they are also often so strongly marked as to cause many writers to deny the possibility of their having all sprung from the wild Vine, but their apparent permanence is in most instances only due to their universal propagation, by cuttings or layers, not by seed. Pliny records 80 kinds, and many others are mentioned by Virgil, Columella, Varro, Macrobius, and other writers, which it is now impossible to recognise with certainty amongst the modern varieties, amounting in some collections to above 300. Fée, Gallesio, and others have, however, endeavoured to identify some with more or less plausibility, of which the following are a few instances: The Apiana of Pliny, or Apicea of Cato, is supposed to be a Muscat imported from Greece, and it is believed that most of the Muscat-flavoured varieties were originally raised in the Archipelago. The ambrosiaca is believed to be another Muscat. The græcula is the Corinth stoneless, or Currant Grape. The rhætica the uva passa of Spoleto, another stoneless and Currant Grape. The venicula, sircula, or staçula, is the marzemina of the Venetians. The dactylites is perhaps the uva galetta of modern Italy. The trifera, the uva di tre volte from Chio. The picina, perhaps the uva colore. The trebulana, the Trebbiano, yielding a wine celebrated for its excellence by Tasso. Others of the Roman names are derived from the countries whence the varieties were imported, such as the biturgica from Bordeaux, the phaia from Illyria, the prusina from Broussa in Anatolia, the ægios from Ægia near Corinth, the alexandrina from Alexandria in the Troas, the aminca, a highly prized variety, from Aminci near Falerno, &c. The eagerness to import into Italy the Vines of other countries celebrated for the excellence of their wines has continued to the present day, Prof. Targioni adducing many proofs of its prevalence in the middle ages. It is a pity the Italians do not at the same time introduce the modes of treatment and manipulation, to the deficiencies in which must be mainly attributed the general inferiority of Italian wines to those produced in similar climates in France and Spain. *Journal of the Horticultural Society.*

The Curl in Peach Trees.—The aphis may easily be got under by the use of tobacco-water, and attention. The tobacco-water may be obtained from a manufactory, if you should live near one; but I find it quite as economical to buy the tobacco and make the water myself, as I am obliged to pay nearly as much for jar, carriage, and porterage as the water costs. I get a pound of the best shag tobacco, which costs 3*s.* 6*d.*, and a pound of soda, which costs 1½*d.*, and dissolve the soda in two gallons of boiling water; it is then poured on the tobacco, stirred, and allowed to remain a few minutes; the liquor is then strained, and two gallons more of boiling water added; this is again strained, and made up to about eight gallons by the addition of cold water, and put on the trees at 100° of heat, on a still moist evening (if one can be found at that time of year). This is applied with a fine syringe, and the quantity is sufficient for 12 trees, each occupying 140 feet of wall. If you have shading materials at hand, the trees may be shaded, in case the sun break out strongly. The mixture may be left on till the next evening, when the engine should be used pretty freely, in order to wash off not only the mixture, but also the dead and dying insects, and as many as possible of those that the mixture does not kill, which, if properly applied, will be few. But if shading be inconvenient, the engine and clean water must be used in the morning following the application of the tobacco and soda, or the sun, being assisted by the crystals of the soda, may scorch the young leaves. The engine and clean water should be used frequently, to dislodge any insects that may be again establishing a colony on any part of the tree. It has been computed by, I think, Bonnet, that an aphis will multiply itself in one season 8,000,000 of times, if left undisturbed in a favourable situation; and of all places, I know of none more favourable to them, in the early part of the season, than the Peach tree; hence the necessity of observing the old proverb, that "a stitch in time saves nine." The trees will rarely want more than one dressing of tobacco, if well attended to with clean water after the first application—or, at the outside, two dressings of tobacco will suffice for one season. *Cox on the Peach and Nectarine.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—The varieties of Lilium lancifolium will now be coming freely into bloom, and should be neatly staked before the flowers are sufficiently advanced to be injured through being blown about. When removed to the conservatory they should be

placed in a cool, airy part of the house, shaded from bright sunshine, and afforded a liberal supply of water, in order to preserve the beauty of the flowers as long as possible; for without a little attention to these small matters, their beauty is apt to be but short lived. These are our most gorgeous autumn flowering plants, and can hardly be too largely grown wherever there is a show house to be kept gay, and we possess nothing half so beautiful that is so easily accommodated; for they merely require the protection of a glass in spring, and with a good stock and a little management in forwarding the blooming of some, and placing others behind a north wall to keep them back, they may be had in flower from the beginning of August till the end of October. Continue to trim and regulate the growth of twiners, thinning out any of the shoots that have done flowering, which will assist in strengthening the others, and tend to keep them in bloom later than would otherwise be the case. Maintain an active war against insects, and endeavour to get these thoroughly subdued before the damp, cloudy weather of autumn sets in, when it will not be safe to use the engine with the same freedom as now. Any repairs necessary to be done to any of the plant houses should be finished as quickly as possible; for the period is fast advancing when it will be necessary to get the plants into their winter quarters, and it is exceedingly inconvenient having painting or other repairs to be completed after the plants are housed. COLD PITS.—There is now a fair prospect of fine weather, which will be highly serviceable to the inmates of these structures, and during bright weather every possible means should be used to encourage late growers, keeping them rather close and moist, while those that have made a fair amount of growth should be allowed plenty of air, removing the sashes altogether on fine nights, and gradually inuring them to freer exposure to sunshine, in order to get the wood well ripened before winter. Shake out and repot Pelargoniums which are sufficiently advanced after having been cut back, and keep them close in a cold frame until they can make fresh roots. Those, however, which are fairly established after repotting, can hardly be too freely exposed to air, or kept too cool. Attend carefully to Chrysanthemums, and see that the shoots are secured against accidents, to which they will be liable if left unstaked after this time. Give them plenty of rich manure water, and place them thinly in an open airy situation, and remove suckers as soon as they make their appearance. Cinerarias for early blooming should be kept cool and moist, for they are exceedingly subject to be infested with thrips and mildew when kept close, and they are too frequently ruined by over kind treatment. Repot Primulas, and encourage them to make rapid growth, especially the double varieties, which are hardly surpassed as useful subjects for winter decoration. Calceolarias for spring flowering should be sown at once, if not already done, but we have now so many fine varieties of the shrubby kinds, and these are so hardy and easily managed, that for mere decorative purposes the herbaceous sorts are hardly worth the trouble they cost. Cuttings of the shrubby kinds put in now will make useful sized plants for flowering next spring, and with very little attention they will form specimens of any desired size for the following season. But showy and useful as these are, they still want the fine markings of the herbaceous kinds, and until this defect is remedied by the labours of the florists the latter will still be generally grown. Keep Violets clear of red spider by liberal washings with the syringe, and give them plenty of manure water. Also attend to tree Mignonette for winter flowering, keeping the plants well supplied with pot room, and in the most vigorous health possible, and pinch off flowers as they make their appearance.

FORCING DEPARTMENT.

PINERY.—Endeavour to afford plants swelling their fruit a high temperature without making too free with fire heat, which, as it tends to render the atmosphere dry, is not at all conducive towards obtaining large fruit. Therefore, economise the sun's influences as much as possible, shutting up early in the afternoon after syringing the plants, and moistening every available surface, and maintain a high temperature during the day, giving air but sparingly. Fruit approaching maturity will, however, be benefited by a little fire-heat, a freer circulation of air, and a dry atmosphere; and where there are no means of avoiding having those swelling their fruit and those ripening it in the same compartment, then it will be advisable to regulate the atmosphere according to the wants of those ripening, for size is of little consequence unless combined with quality. But with care in keeping the plants swelling their fruit well supplied with water at the root they will not suffer much through the atmosphere being kept rather dry. Those, however, who can remove fruit approaching maturity to a separate house will find it a good practice to do so during the autumn and winter months. Look at former Calendars, and give particular attention to securing a good supply of fruit for winter and spring use. VINERIES.—The weather is now very favourable for Vines in all stages. Give abundance of air both night and day while the weather continues warm and dry, to those ripening their wood, and also where the fruit is ripe or ripening. Young Vines will, however, require some attention in the way of shading their tender points; for after the unusually cloudy season which we have experienced, these, if fully exposed to intense sunshine, will be very apt to scorch. But it will be necessary to shade only the points, as there will be no danger of scorching where the foliage has had time to gain substance. Attend to former directions and keep thrips and spider in check; and also protect ripe fruit from wasps, which have here, within the last few days, become very formidable annoyances. MELONS.—Take advantage of the present fine weather to give the soil a good soaking of water where this is necessary, and also to trim the Vines, removing all useless growths, &c., which in bright weather can be done without any risk of inducing canker. Give air freely where the fruit is ripening, and keep the atmosphere as dry as possible. If any of the last plants are infested with spider, ply the syringe morning and evening as freely as can be done without bruising the foliage, and use every means to get the plants perfectly clean, while the syringe may be used with safety. FIGS.—Some experience is requisite in order to be able to manage these properly at this season; for there is considerable danger to the early crop next season in stopping the young wood too early, or in allowing growth to continue later in the season than will allow of getting the wood well ripened before winter. Unless where the second crop is all but ripe, so as to allow of keeping the trees cool and dry at the root, and exposing them freely to air, the young growth must on no account be stopped, but the shoots should be kept thin, and regularly tied in so as to expose the foliage to light and air.

FLOWER GARDEN AND SHRUBBERIES.

Timely attention should be given to the propagation of the variegated-leaved Geraniums, such as Flower of the Day, Mountain of Light, and Golden Chain, which, forming as they do, most beautiful beds, and serving almost every desirable purpose in the economy of modern "bedding out," are first-rate plants. But, unfortunately, they are rather shy growers, except when planted out in rich light soil, and gross soft wood is not certain to root under any treatment. Cuttings will strike freely, however, if planted where there is a little dry bottom heat, under the shelter of a hand-glass in the open border or in a cold frame, but they are very liable to damp off in the moist atmosphere of the ordinary propagating pit. Look over the beds and see whether their appearance can be improved by any means, and spare no attention at the present time which can be made to render the effect more satisfactory. Go over the Rose beds frequently, removing decaying flowers, &c., and keep mildew in check by dusting affected parts with sulphur immediately they are perceived. Any stocks not yet budded should be seen to at once.

FLORISTS' FLOWERS.

During this splendid weather do not let either Dahlias or Hollyhocks suffer from want of water; propagate the latter by cuttings of the side shoots, remove the faded flowers at the lower part of the spike, and should seed not be wanted pluck it also. Layering Carnations and Picotees should be completed as speedily as possible; examine the seed pods, and cut off the upper part of the capsules, to expose them more to the action of the sun. Watering the layers with a fine-rosed watering-can in the evening, with water which has been exposed to the action of the sun during the day, will materially aid the development of roots. Continue to propagate Pansies by side shoots; they root very freely now. Prepare the bed for offset Tulips, and a turning over will sweeten the main bed; this should not be lost sight of.

HARDY FRUIT AND KITCHEN GARDEN.

Keep the young shoots of Peaches, &c., closely nailed in, and thin, in order that they may be fully exposed to the influence of the sun. Protect the fruit from wasps, by the use of a thin net, if it cannot be done otherwise, but avoid shading the trees at present, unless absolutely necessary. If not previously done, cut off Strawberry runners, and trim and clean the beds so as to expose the plants, for bearing next season, to light and air, in order that they may be strong and well matured, when there will be no danger of their showing plenty of fruit next spring. Another sowing of Lettuce, to stand the winter, should be made, choosing a bit of light dry soil, also a small bed of Cauliflower, and some Cabbage, to succeed the August sowing. Attend to providing a good supply of salad for late use. Plant out Lettuce and Endive on light rich soil. A good breadth of Cabbage may now be planted on deep rich soil; these should be planted at about a foot apart each way, and every other row, and every other plant in the other row, may be used as soon as large enough to be worth cutting. Attend to taking up, drying, and storing Onions. Persevere in the destruction of weeds, which have been unusually troublesome this season, and stir the surface of the soil among growing crops.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 31, 1854, as observed at the Horticultural Gardens.

August.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

Aug. 25—Fine; very fine, with dry air; clear at night.
— 26—Very fine; exceedingly fine throughout.
— 27—Very fine; overcast and warm; cloudy and hot.
— 28—Overcast; very fine throughout.
— 29—Very fine throughout.
— 30—Clear and fine; cloudless and hot.
— 31—Clear and fine; very fine; clear at night.
Mean temperature of the week, 3 deg. above the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending Sept. 9, 1854.

Sept.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 3	70.1	48.9	59.5	10	0.48 in	2	6	2	1	4	6	6	1
Mon. 4	70.0	48.2	59.1	12	0.58	3	7	3	—	4	4	3	2
Tues. 5	69.8	48.5	59.1	14	0.30	3	5	6	—	5	3	4	2
Wed. 6	69.8	46.6	58.2	12	0.70	1	7	3	—	1	9	6	1
Thurs. 7	69.0	48.3	58.7	15	0.35	1	4	4	2	4	9	3	1
Friday 8	68.0	48.4	58.2	12	0.65	3	5	2	2	3	9	2	2
Satur. 9	68.1	49.5	58.8	13	1.09	—	4	2	2	5	7	6	2

The highest temperature during the above period occurred on the 3d, 1843, 5th, 1848, and 7th, 1843 and 1846—therm. 83 deg.; and the lowest on the 4th and 6th, 1850—therm. 30 deg.

Notices to Correspondents.

AZALEAS: *J B.* Your Azaleas are dying because the roots are mismanaged. Three men ought to keep it in excellent order.

BOOKS: *W J.* There is no such book as that about which you inquire.‡

BRUSSELS SPROUTS: *Brassica.* Your gardener is right in taking off the side leaves; but he must not do it too soon, or he will make the sprouts branch. As to taking off the crown, opinions differ; in Scotland it is usually left on. The removal, if any, must not be made before October, or it may throw so much strength into the sprouts as to spoil them, unless they are intended for autumn use.

COMPOSITION FOR TREE WOUNDS: *Sub.* The best with which we are acquainted is Forsyth's, which, for your benefit, we reprint from Lindley's "Guide to the Orchard and Kitchen Garden," pp. 507 and 508:—"Take 1 bushel of fresh cow-dung, half a bushel of lime rubbish of old buildings (that from the ceilings of rooms is preferable), half a bushel of wood-ashes, and a 16th part of a bushel of pit or river sand (the last three articles are to be sifted fine before they are mixed), then work them well together with a spade, and afterwards with a wooden beater, until the stuff is very smooth, like fine plaster used for ceilings of rooms. The composition being thus made, care must be taken to prepare the tree properly for its application, by cutting away all the dead, decayed, and injured part, till you come at the fresh sound wood, leaving the surface of the wood very smooth, and rounding off the edges of the bark with a drawknife or other instrument, perfectly smooth, which must be particularly attended to; then lay on the plaster about an eighth of an inch thick, all over the part where the wood or bark has been so cut away, finishing off the edges as thin as possible. Then take a quantity of dry powder of wood-ashes mixed with a sixth part of the same quantity of the ashes of burnt bones; put it into a tin box with holes in the top, and shake the powder on the surface of the plaster till the whole is covered with it, letting it remain for half an hour, to absorb the moisture; then apply more powder, rubbing it on gently with the hand, and repeating the application of the powder till the whole plaster becomes a dry smooth surface. If any of the composition be left for a future occasion, it should be kept in a tub or other vessel, and urine poured on it so as to cover the surface, otherwise the atmosphere will greatly hurt the efficacy of the application. When lime rubbish of old buildings cannot be easily got, take pounded chalk or common lime, after having been slaked a month at least. As the growth of the trees will gradually affect the plaster, by raising up its edges next the bark, care should be taken, when that happens, to rub it over with the finger when occasion may require (which is best done when moistened by rain), that the plaster may be kept whole to prevent the air and wet penetrating into the wound." Mr. Forsyth says, farther on, "As the best way of using the composition is found by experience to be in a liquid state, it must therefore be reduced to the consistence of a pretty thick paint, by mixing it up with a sufficient quantity of urine and soapsuds, and laid on with a painter's brush. The powder of woodashes and burnt bones is to be applied as before directed, patting it down with the hand."

FRUIT TREES: *J S.* Against a flued wall, 180 feet in length, may be planted the Royal George, Noblesse, and Bellegarde Peaches; the Violette Hâtive and Balgowan Nectarines; two Moorpark Apricots; the Royale Hâtive, Greengage, and Purple-gage Plums.‖

INSECTS: *Constant Reader.* The insects which have attacked your Melons are one of the species of Chelifer. The fact is a new one in their natural history. We should think that if your fumigations had been done with sufficient care under a close cover, the insects would not have escaped.—*T B.* We were aware, by the newspapers, that the Scotch Fir had suffered much from caterpillars this season, but unless you send us specimens, we can give you no more precise direction for their destruction than shaking the trees well over sheets, and collecting and burning the caterpillars.—*W M.* The little beetles which are attacking the White Mustard crops in the fens near Ely are the Chrysomela (Phædon) Betulæ. Such a fact has not been previously recorded. As they do not leap, it will be easy to capture them by shaking the plants over a white cloth laid on the ground.—*W F D.* Your fine caterpillar is that of the Privet hawk moth, Sphinx ligustri. *W.*

NAMES OF PLANTS: We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J A F.* Purple Orache, striped Funkia, and Lucerne!—*P F E.* We cannot undertake to name heaps of plants; four is our limit, as we have over and over again announced. 2, Hymenocallis littoralis; 3, Crinum confertum; 1, Crinum asiaticum; 12, Viola calcarata.—*A Z.* The broad leaf is Lomaria procera; the other is Asplenium ebeneum. *S.*

PLAN OF GARDEN: *Amateur.* The pattern is drawn upon the true principles of good taste. Sink it by all means. Grass will look best in winter, but its frequent dampness is an objection. We should prefer gravel. As to fruit-trees, wall No. 1 may be planted with Marie Louise, Passe Colmar, 2 Glout Morceau, Knight's Monarch, Beurré Diel, 2 Easter Beurré, and 2 Beurré Rance Pears. Wall No. 2, with Royal Hâtive, 2 Early Orleans,‖1 Jefferson, and 1 Mirabelle Plums. Wall No.3, with 2 May Duke Cherries, and 1 Moorpark Apricot. Wall No. 4, with Jargonelle Pear, Broom Park do., and 3 Morello Cherries. And wall No. 5, with Royal George, Grosse Mignonne, Bellegarde, and Barrington Peaches, Violette Hative and Elruge Nectarines, and a Moorpark Apricot.‖

SEEDS: *A H.* The following may be raised with the means you possess; 1, 2, 3, 4, 5, 17, 18, 23, 24. Sow them in a hotbed now, and keep them in a greenhouse over the winter. The others require stove heat. None are very much worth having. Of the creepers, No 2 is the common Convolvulus major. The rest are very tender.

VINES IN POTS: *A.* The Black Hamburgh and Royal Muscadine are the best sorts for pot culture. The plants will have light enough if you place them near the front sashes, as you propose. The Hamburgh may colour black, or only red, but when well ripened the flavour is in either case equally good. You may, however, introduce a few pots of the Black Prince, which is almost sure to colour well, even where the Hamburgh does not, but recollect that after it is black it requires to hang a long time before it is thoroughly ripe. You will do well by adopting Mr. Rivers' plan of allowing the roots of the fruiting plants to extend into the border, or into prepared compost.‖

UPPER PERUVIAN GUANO ON SALE.—Apply to W. & J. Ravenscroft & Co., Liverpool.

Extract from a Report of Dr. Ure, F.R.S., &c.

"Your Upper Peruvian Guano is worthy of all commendation."

Extract from the Report of George Layton, Esq.

"Ravenscroft's Upper Peruvian Guano will last longer, and eventually do more good than Gibbs', or any other I have ever tried. It possesses the very finest qualities of both Guano and Bone Dust."

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
Wm. Inglis Carne, 10, Mark Lane, London.

PEAT CHARCOAL.—The undersigned have a cargo of this valuable Deodoriser and fixer of Ammoniacal matter, on Sale. Apply to Mark Fotheergill & Co., 204A, Upper Thames Street.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE LONDON MANURE COMPANY beg to call the attention of Agriculturists to their WHEAT and CLOVER MANURES for present use. The London Manure Company also offer Genuine Peruvian Guano, Nitrate of Soda, Concentrated Urate, Superphosphate of Lime, Fishery and other Salts, and all Artificial Manures of value. The London Manure Company guarantee Peruvian Guano and every Manure they supply to be strictly genuine. Edward Purser, Sec.

Bridge Street, Blackfriars.

CORN CRUSHERS AND CHAFF CUTTERS.—A large display of the best Farm Implements shown in operation. Price Lists sent free on application.

BURGESS and KEY,
103, Newgate Street, and 52, Little Britain, London.

PUMPS AND HOSE PIPES FOR GARDENS AND LIQUID MANURE.—Burgess & Key's Pumps were highly commended by the Royal Agricultural Society of England at Lincoln. Price Lists sent free.

103, Newgate Street, and 52, Little Britain, London.

CHURNS.—ANTHONY'S PATENT AMERICAN CHURN.—Since 1849 this Churn has obtained all the Prizes awarded by the Royal Agricultural Society of England. At the trial before the Judges it made in 10 minutes 4 lbs. 6 oz. of Butter from 4 quarts of Cream, being 8 oz. more than any of the other Churns from the same quantity and quality of Cream.

103, Newgate Street, London.

BALANCE OF FACTS IN FAVOUR OF RICHMOND and CHANDLER, who have, in competition with the best selected CHAFF CUTTERS of the most celebrated makers in the trade, carried off the highest prizes against all comers.

COPY OF TESTIMONIAL

"Early Court, Reading.

"Gentlemen,—I beg to hand you a cheque for your Corn Crusher; I must add, at the same time, that nothing can exceed the goodness of the Machine. I have found in it all I can wish, and, moreover, a very superior finished Machine, and a pattern for other makers. (Signed) "Geo. Shackell.

"Messrs. Richmond & Co."

Address.—Richmond & Chandler, Manchester; and South John Street, Liverpool.

REAPING AND MOWING MACHINES.—Caution.—Notice is hereby given, that any person or persons infringing any of the Patents of Cyrus Hall M'Cormick, for Reaping and Mowing Machines, or making, or vending, or using, or exercising any Machines which in any way infringe upon any such Patents, will be proceeded against according to law. The more prominent features of M'Cormick's Patents consist in a serrated cutting blade, spear-head shaped holding fingers, and a gathering reel.

E. J. & H. Lawford, Mr. M'Cormick's Solicitors.
Draper's Hall, 27, Throgmorton Street, London, Sept. 2.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to Walter Carson & Son, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. Nesbit, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

STIRLING GENERAL AGRICULTURAL ASSOCIATION.—REAPING MACHINE COMPETITION.—The competition for the following Premiums, offered by the Association, will commence at Steward Hall Farm, near Stirling, on FRIDAY, the 8th September next, viz.:—

For the most approved Reaping Machine, of any price £20
For the most approved Machine, not exceeding 25 guineas in price £20

Should the Judges fix on a machine of 25 guineas or under to be the best in the field, it will thereby be entitled to both prizes.

The price and simplicity of construction of all the Machines will be taken into consideration in awarding the premiums, but the Society reserves the power of withholding the premiums if, in the opinion of the Judges, the machines are not of sufficient merit.

ELEVEN MACHINES HAVE BEEN ENTERED FOR COMPETITION.

The Machines will be on the ground at 8 o'clock, A.M., but the public will not be admitted till 12, noon. Tickets to be had of Mr. Murrie, Agent, National Bank, the Treasurer; and Messrs. W. Drummond & Son, Agricultural Museum, Stirling.

By order of the Committee,
W. Hutton, } Joint
W. Forrester, } Secretaries.

Stirling, Sept. 2.

The public will be admitted, by Tickets, at 12 o'clock, at 2*s.* 6*d.* each, and after 2 o'clock, at 1*s.* each.

Dinner at Campbell's Golden Lion Hotel, at 5 o'clock, P.M., after the competition. Tickets 5*s.* 6*d.* each, to be had of Mr. Campbell, to whom parties at a distance wishing to be present at the dinner, are requested to write, and secure their Tickets before Tuesday, the 5th proximo.

THE SALISBURY AND WESTERN COUNTIES EXHIBITION OF DOMESTIC POULTRY.—The Fourth ANNUAL EXHIBITION will take place on Tuesday and Wednesday, the 21st and 22d days of November, 1854. Prize Lists, &c., to be had of T. Pain, Hon. Sec.—Salisbury, July 22.

A GRAND EXHIBITION OF POULTRY will be held at CAMBRIDGE, on WEDNESDAY, THURSDAY, and FRIDAY, November 8th, 9th, and 10th, under the distinguished patronage of His Royal Highness Prince Albert, Chancellor, T. C. Geldart, Esq., LL.D., Vice-Chancellor, A. G Brimley, Esq., Mayor, and numerous Members of the University, Town, and County.

150*l.* will be given in prizes. Schedule now ready.

C. H. Crosse, M.A., Hon. Sec., New Square.

The Eastern Counties Railway have consented to convey Poultry, free both ways, and to issue Passenger Tickets at a Single Fare.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 2, 1854.

MEETINGS FOR THE ENSUING WEEK

Thursday, Sept. 7—Agricultural Imp. Society of Ireland.

The progress of agricultural improvement in Ireland is a matter of congratulation, not only to the Irish but to the English public. The errors of Irish farming are gradually diminishing in number and importance. The old and ill-constructed wooden plough has been almost supplanted by implements of approved construction; well bred and properly tended live-stock are now very generally spread over the country; and, in short, we find in every county unmistakeable evidence that brighter days have dawned for the staple industry of the country.

And while the Royal Dublin Society, the sister Agricultural Improvement Society, the Flax Improvement Society, and several legislative and local measures have largely contributed to this desirable end, we cannot help thinking that the foundation of much of the social regeneration of the country lies in the system of national education. Intelligence is spreading, and diffusing its happy influence on Irish society. The Government system of education in Ireland partakes in an eminent degree of what has been lately so much looked for, namely, the "science of common life." It embraces those subjects which constitute a good English education, and aims at utilitarian objects. Its promoters know full well that every class of society requires an education suited to its calling, and act accordingly. That this is true is evident from the fact that one department of the system is exclusively devoted to agriculture. It is to this department that our subsequent remarks apply.

It must be clear to any person at all acquainted with rural affairs that while the small farmer lives in an isolated state, without education, or any means of becoming acquainted with the improvements made in the multifarious branches of his every-day business, he can neither meet sudden emergencies nor extract the maximum produce from his holding. But afford him a sound education, and he necessarily becomes a very different man. He is no longer blind to the march of improvement, nor excluded from intercourse with others. This seems to us the true light in which to view the agricultural education system in Ireland. There are ramified throughout the country about 100 model and ordinary agricultural schools, all off-shoots from the admirable central institution at Glasnevin, near Dublin. At the latter institution, 75 students are annually educated, while agricultural instruction is afforded to an average of 30 pupils in each of the minor schools. The students who graduate at Glasnevin, are so many pioneers of agricultural progress. We have known several of them who not only set an example of good management on their own farms, but also communicate their knowledge to circles of friends and neighbours. With such machinery in operation, it is not to be wondered that the system has recently attracted so much attention. Its operations have been steady and certain, and its efforts not like those agents of Mushroom growth which die with their rise. We have lately been through the country and made ourselves acquainted with its organisation, from the school gardens in remote districts to the Glasnevin parish training school. We were delighted and instructed. The leading impression relative to the system, on our mind, is that it should be extended and placed on a still firmer basis. We fully coincide with the sentiment of Sir R. Kane, that "every school in Ireland should be an agricultural school if situated in a rural district." As a path of policy (to say nothing of benevolence) every landed proprietor in Ireland should see that agricultural instruction is imparted in the schools on his property.

These remarks are suggested and, indeed, enforced by our recent tour, and the perusal of the quarterly journal published by the Board of Education, and edited by the officers at Glasnevin. Five numbers of this journal have already appeared, conveying not only useful information regarding the system, but also excellent lessons on agriculture and its collateral sciences. We learn from it that there are two classes of pupils in course of training at Glasnevin—an *intern* free class, the sons of farmers, land-stewards, &c., and an *extern* class, the members of which board and lodge at their own expense, and pay a small entrance fee.

The course of instruction embraces the ordinary branches of secular education, surveying, natural philosophy, agricultural chemistry and geology, botany, and veterinary science, under separate professors. The intelligence of the pupils has called forth the highest encomiums of the most competent authorities, among whom we may mention Professors Nash and Hitchcock, of Amherst College, United States, the Rev. Mr. Gleig, Inspector-General of Military Schools, Martin Doyle, &c. The farm offices at Glasnevin are spacious and well arranged; indeed, the cow-house and dairy would well repay a visit. The machinery for economising farm labour is the most complete we have seen. The school and lecture room contain a large collection of most valuable maps, charts, and philosophical apparatus, and a valuable collection of minerals for illustrating the lectures on the relation and application of geology to agriculture. Cleanliness, simplicity, and order, characterise all that came under our observation. The site is healthy, and the farm sufficiently large to illustrate the most improved system of farming. The promoters of national education may well feel proud of such an institution. We cannot too strongly convey our conviction of the great usefulness of the Albert Institution, and of the facilities it affords to the Irish farmer for educating his children.

The Irish agri-industrial education scheme has already effected more than its most sanguine supporters anticipated; and now, that there seems to be no difference of opinion as to its usefulness and efficiency, we would urge upon the legislature the importance of extending the sphere of its operations. We would hail the universal engrafting of the agricultural upon the literary department of national education as one of the most essential steps for ameliorating the condition of the Irish cottier and farmer. Nor can we forget the claims of the schoolmaster, whose prospects it would brighten and whose emoluments it would enhance. To him the school-garden would be a place of healthy recreation, and a source of social comfort and pecuniary gain.

We have thus briefly glanced at the most prominent features in the system; and for further details refer our readers to the reports presented to Parliament and the "Albert Agricultural Journal"—an unassuming little periodical, which, being mainly supported by the students educated at Glasnevin, conveys a good idea of what that institution is accomplishing. We believe it may be had gratuitously by applying to "The Secretaries, Education Office, Dublin," or to "Dr. Kirkpatrick, Glasnevin, Dublin."

Farming economy includes a long catalogue of practices, and chaff cutting is one which has been for a considerable period reckoned important. Hay, straw, and other fodder have been thus reduced to a state in which their use has been greatly economised. Nothing has more favoured the extension of this practice than the increased application of steam power in agriculture. Nor is this at all surprising, when we inquire into the merits of the practice. The cutting of different materials into finely divided and minute portions does not add to their

nutritious value; it is, therefore, in the prevention of waste that we must look for advantage; its use and value in feeding such animals as the horse and the bullock are exhibited by their being induced to eat, entirely and indiscriminately, hay, inferior in quality, or in admixture with straw, a considerable portion of which they would refuse in the ordinary state, though it will often be found, upon analysis, to be as nutritious as those portions which are more attractive to them. The object sought for in mixing chaff with oilcake and other feeding materials is not always obtained, for it often happens that the chaff is "routed" out of the feeding troughs by the animals (particularly sheep stock) in their search for the superior food. When the food is composed either of hay or straw, separate or mixed, and moderately steamed, just sufficient to damp it thoroughly, and meal or mucilage of any kind is mixed with the chaff, the whole mass becomes so entirely blended, that in this state there is so little chance of waste, that it certainly answers for feeding beasts better than in any other manner.

There is an opinion, which is too prevalent, that all the animals which require hay should receive it wholly in this form; but this idea we believe to be erroneous. However desirable it may be to adopt the system of chaff-feeding, it will, we believe, be found that all animals should receive at least a quarter part of their daily allowance of hay in the ordinary state, if only, as practical men express it, for the purpose of "cleaning their mouths." There is a disadvantage in feeding horses when the whole allowance of hay is given as chaff; it is apt to injure their wind, where previously impaired, owing to being swallowed without a sufficient quantity of saliva. And a portion of hay in the ordinary state is more especially necessary, in the case of ruminating animals, in order to assist digestion, particularly whilst feeding upon highly nutritious substances. Our attention has been often called to this point, by noticing the avidity with which it is consumed by the stock, showing how they relish and enjoy this natural mode of feeding.

Hay or straw chaff is often used with good effect in connection with Trifolium, Tares, or Clover, &c., being mixed in the proportion of one-fourth dry fodder to three-fourths green food, and passed through the cutter together.* This mixture forms an excellent food at the period of transition from roots to summer produce, and it will also be found a very desirable mode of soiling young animals, or store stock, when they do not receive oilcake, corn, or such like substances.

The use of cut hay for the feeding of fatting sheep in the open field has been much discontinued of late, there not being found sufficient gain in the practice to pay the cost of cutting. If we take the loss of good hay when given in the ordinary state, at regular intervals, and in proper quantities, it will not amount to more than one-twentieth part, or a cwt. in a ton; and it must be remembered that chaff is not always given without some loss, arising from wet or windy weather; we must therefore put the loss on chaff-feeding at half a cwt. per ton, which will only leave an actual difference or loss against feeding with hay in the ordinary state, of 56 lbs. to the ton, and the wasted portion must be considered of some value to plough in as manure. We will, however, place the value of loss at 2*s.* per ton, and this sum will not pay the cost of converting the hay into chaff; for by the aid of steam-power it will amount to at least 3*s.* per ton.

Of course, a very important exception to this calculation will be found in cutting inferior hay into chaff; it is made more palatable for store sheep and beasts, and in most instances they may be induced to eat a larger portion of it as chaff than they would if given entire. In the act of cutting hay into chaff, when it has been damaged by mould in the stack, the dusty portion in a great measure flies off, and leaves the hay less tainted and much better for feeding any description of cattle; and when steamed and mixed with other substances, the objectionable flavour of mouldy hay is often removed altogether; and at the time of cutting a further great improvement could be effected by exposing the chaff as it falls from the cutter to the action of a blowing-machine or fanners, by which means the dust might be blown out through a wire sieve or screen sufficiently fine to keep back the chaff.

Loose corn, either Oats or Dredge Corn, which is a mixture of Oats, Barley, and Peas in the straw, is often cut into chaff just as it comes out of the rick or barn, and in some seasons when the straw is not very bulky, and Clover is amongst it, being saved also in fine weather, it is an excellent method of disposing of the crop, for threshing is dispensed with altogether, and the mixture being a good one, it is done without any waste. And, indeed, after being cut into chaff its value may be increased or diminished, by adding bruised corn or hay chaff in such quantity as may be deemed desirable.

Whenever corn or pulse is given with chaff, it should be in the cracked or bruised state, as it insures a more intimate mixture. Chaff cutting has latterly been made available in the preparation of straw for litter; here again it is found that steam power is of the utmost importance, for, by either hand or horse power, there is not sufficient advantage in the practice to pay the cost of cutting. It is proper to remark here that a great deal of one's experience in this matter depends upon many things, such as the food and health of the animals. We have seen cattle lying dry and clean in sawdust; for box-feeding, however, a certain length of litter is necessary. We have noticed animals, bullocks and pigs in particular, when box-feeding, littered with straw chaff cut very fine; but they were in a miserable state; the sinking of the feet of the bullocks, and the digging of the pigs, had so disturbed the accumulated mass of manure under them, that it produced an excessive state of fermentation, highly detrimental to their health. We therefore recommend that in all cases when straw is cut for the purposes of bedding box-fed animals, that the length should be about 8 inches;† it will then tread down firm, and become more readily converted into dung, and prove more uniform and better in quality than by the use of whole straw or fine chaff.

Some of our correspondents have at different periods inquired for information as to the proper quantities of chaff to be given to the different animals upon the farm. Suppose every animal requiring chaff to receive one-fourth of its daily allowance of hay, or straw in the ordinary state, and the difference required in the food for fatting or store animals to be varied accordingly—the fatting animals getting corn or cake in addition to roots or Grass—the store or stock animals getting only roots or green food in addition—it may then be stated that the working horse would require 18 lbs. of hay and straw chaff, mixed in the proportion of two-thirds hay and one-third straw. Bullocks would require, whilst working, 30 lbs. of mixed chaff; fatting beasts, 24 lbs. of Clover-hay chaff; dairy cows or store cattle, 30 lbs. of mixed chaff. Fatting sheep would require 1 lb. of Clover-hay chaff, whereas, store sheep and breeding ewes would require 1½ lb. of the same. The foregoing statement contains, of course, a mere approximation to the quantities which the different kinds of stock require, and it is calculated only as a guide to the novice, and those who have not had the opportunity of practically noticing the great variation in the requirements of different animals, under varying circumstances.

* We lately saw this plan adopted with excellent effect, and, by means of Balls' adaptation of the ordinary hand chaff-box, in a very economical manner on Mr. Baker's farm at Writtle.

† Chaff cut nominally 4 or 5 inches long will be more than this in reality: and a portion of the material, being of the length recommended above, will answer every useful purpose. Pigs ought not to be bedded on the box-feeding principle at all.

MANGOLD WURZEL RUNNING TO SEED.

YOUR correspondent, in a late number, signing himself "Subscriber," is, like myself, and very many others this year, a sufferer from his Mangolds running to seed, or what is commonly called starting. He appears to have been studying the misfortune, but can neither arrive at the cause nor suggest a prevention, yet he comes to the conclusion that ill-selected seed may have to do with it, and all at once blames the grower for mixing seed saved from what has prematurely run with that which had been saved in the ordinary and only proper way; by prematurely run plants, I presume he means such plants as had been sown for a crop of roots, say in April or May, but instead of bulbing have thrown up a flower stem; if so, "Subscriber," is entirely mistaken, for, although they offer to flower, who ever saw those premature plants ripen seed?—if our summers continued until Christmas we might probably save seed from Mangolds sown the same year, but as this is not the case, it is impossible.

The tendency of bulbing plants to run to seed is, I fear, much on the increase, for of late years not only the Mangolds have run to an alarming extent, but in some particular localities the Swede Turnip has started so freely that many farmers have lost half their crop. I know of one instance where a gentleman procured from an eminent grower a parcel of the seed of Skirving's Improved, with part of which he sowed two acres on his home farm, the remainder he sowed on another farm in a different county; when the two acres grew up he was chagrined and disappointed to see little else than a crop of plants resembling Rape, with hardly any bulbs; he naturally concluded that his seed merchant had by mistake sent him Rape, and that all his crop would be the same, bnt great was his surprise to find that of the 10 acres sown in the adjoining county there was not a Rape-like plant amongst them, but a field of as fine bulbs as he ever saw. How to account for this strange malformation in the 2 acres he knew not, as both fields were equally well cultivated, and the seed was sown out of the same bag. Besides this, I know of other instances where such strange sporting has taken place, one where the seed was saved by a friend with the greatest care from large selected transplanted bulbs; the first year a heavy crop of fine bulbs was produced from this stock, but part of the same seed kept over by the farmer, and sown the following year, gave hardly anything but Rape-like plants. Again, seed saved from transplanted roots produced, the first year, Rape-like plants, while a portion of it kept over and sown the following year grew large handsome bulbs without the slightest sporting. If any of your numerous readers could account for such a change in the character of the plant, or suggest a preventative, they would confer a favour on agriculturists. This non-bulbing of the Swede has been observed to exist to a greater or less degree in certain localities, but only within the last two or three years, appearing, like the cholera or other epidemic, in one place one year and not in another, while the following year its locality may be quite reversed, but it is most generally observed in the richest and best districts, or where the situation was low, and the soil of an alluvial nature. As in Mangold Wurzel, all the varieties of Swede have shown a tendency to run, with perhaps the exception of Laing's Swede, but with Skirving's variety the cases are the most numerous. This extraordinary tendency to start is not confined to Mangolds and Swedes only, but it is common with many other plants this year, as the Carrot, Cauliflower, Cabbage, &c., and even the Onions are not bulbing, but are in many instances running to flower.

Your correspondent concludes that the running to seed of the Mangold Wurzel cannot be attributed to the time of sowing, or the state of the atmosphere, or soil, for if that was the case it would apply equally to the whole crop. What the mysterious agent may be I am not prepared to say, but this I know, that part of my own Mangold Wurzel which was sown at an early period has shown a decided tendency to run, while what was sown later in the same field, and from the same parcel of seed, has hardly produced any seeding plants; besides, it is not conclusive evidence that, because the whole crop has not been affected, the cause is not in the atmosphere or time of sowing, for we all know that the braird of a field does not take place simultaneously, but the difference of even a week or more in the vegetating of the seed is not uncommon, and this year both crops came up most irregularly; it is therefore quite possible that the plants which came up first may have been influenced by some agent which as yet is not understood, but which was sufficient to cause the change in the habit of the plant, while, what came up later may not have been so affected. *Another Subscriber.*

REAPING MACHINES.

HAVING partially used Hussey's Reaper improved by Garrett (but not made by him) for three harvests, for the purpose of giving it a fair trial, and having finally decided on laying it aside, I am inclined to give you the result of my experience. This reaper certainly cuts upstanding crops very perfectly, provided the straw be dry and the ground hard; and if the men on the machine and those tying up do their duty properly, the work is done at the least as well as by the hand reapers of these parts, and better than by fogging or mowing. But against this has to be put the annoyance of frequent breakages and frequent stoppages. I have met the breakages by having extra knives always in the field, and a second machine; but besides the incidental breakages, which may be called accidental, my bailiff tells me that many breakages are caused by the inaccuracy of the workmanship of the country mechanics, who have to take to pieces and reconstruct the machines, and who must always be inferior to the workmen of the great machinists, but upon whom most agriculturists must depend. The stoppages also by weather are frequent in this uncertain climate, and more than those by breakages, have convinced me of the expediency of giving up the reaper. For instance, we go to work on a fine bright morning, and work merrily for three, four, or six hours, suddenly up comes a heavy cloud from the sea, down comes a heavy shower, the reaper is stopped for the day—all your men are thrown upon your hands. If the rain stops, you may send them off to hand-reaping with only a partial loss of time and money; but if the remainder of the day is wet, you must either find work for them under cover, which it is not easy to do for so many, or you must pay harvest wages for no work. It is clear that interruptions of this sort, occurring frequently, render this reaper too uncertain to depend upon for a harvest; and the money loss caused by the interruptions form a heavy drawback against the saving which otherwise would certainly be made as against hand-reaping, if the reaper could day by day go through its work with regularity. I am aware that various improvements have been made in the machines since I bought mine, but none of them sufficiently meet my objections. The last improvement, and to my mind the most important, is the tipping-board, which delivers the sheaf without the use of the rake. The motion is at present given to the board by raising it with the foot, and again dropping it. Considering that the muscle of the calf is about the least developed part of a labourer's body, it seems to me that in practice no labourer will maintain this motion of the leg so long or so easily as he now does that of the arm. But why should not the board be raised by the arm or at ever movement instead of by the leg? Or rather, why should not the machine itself communicate motion to the board, and in such a

manner that it should be regulated at option to rise every two, four, or six yards, according to the bulk of the crop? I must, however, express an opinion that no machine will be generally available which will not cut somewhat damp straw, and deliver (as Bell's and its modifications do) out of the track of the horses. It could then, with the attendance of at most a couple of men, cut down a field, and leave the corn to be tied up without hurry and by task-work. The farmer would then be provided with an implement, in the use of which, if interrupted in its day's work, the loss and inconvenience would be reduced to a minimum. A more perfect machine is required for this country than for the Americans. Their crops being lighter are more easily cut, their grain being of much less value on the ground, greater waste can be afforded, and their manual labour being at a higher rate is more easily competed with by machinery. Moreover English labourers being bred up in the notion that machines are their enemies feel little willingness to overcome difficulties; and therefore an agricultural machine for this country, unless almost self-acting or of supereminent efficiency, requires too much of the master's superintendence to be entirely successful.

Machinists, have, however, reason to congratulate themselves that in so difficult an operation as harvesting the large crops of an English harvest, and under the severe trial of our variable climate, they can even now meet manual labour in many cases at least on an equality, so as to obviate all apprehension of any great increase of expense in future years from a deficiency of labourers. They are already in sight of the goal. Only let them persevere and perfect success must be attained. Meanwhile, the progress of the country tends daily to make agriculture a better customer to them. Trade, mining, and manufactures, with a constant flow of emigration, demand more and more hands from the agricultural districts, and give room for the introduction of mechanical appliances. This is as it should be. The low-paid agricultural labourer or his progeny is thus converted into a more efficient consumer, beneficially to himself and to the community; while agriculture, relieved of the incubus of an over-numerous labouring population, at once improves her economy and her comfort, and rises in the scale of human occupations by becoming less and less an exercise of mere animal strength, and more and more an exhibition of the subjection of matter to mental intelligence. *Alex. Hall Hall, Watergate, Emsworth.*

ROYAL AGRICULTURAL COLLEGE.

SESSIONAL EXAMINATION IN PRACTICAL AGRICULTURE.

JUNE, 1854.

[The following are some of the questions with their answers, by Mr. H. Chancellor:—]

[1. Define stock, as possessed by any manufacturer. How may it be classified? Illustrate this classification by applying it to farming stock.]

1. The term stock, as respects any manufacturer, implies moveable property, possessed or acquired with a view to, and in connection with, productive industry; hence it is of three characters, as seen clearly in the case of the farmer.

a. The undeveloped material, both live and dead stock; as live stock, herds of cattle, flocks of sheep, pigs, poultry, &c.; dead stock, seed corn, manure (artificial and otherwise), artificial food, as oilcake, linseed (hay and straw to be consumed on the farm).

b. The means which the farmer has of developing such, and rendering fit for obtaining its money value, in the form of implements, &c., as ploughs, harrows, scarifiers, rollers, drills, &c.

c. The developed material, or all ready converted produce, both as regards live stock, fat cattle, and their products of cheese, butter, and calves, sheep, pigs, poultry, and eggs. Dead stock—all corn, Wheat, Barley, Oats, Beans, Peas, Flax, &c., and in this may be included all the produce now existing in the form of stacks, which of course require certain modifications, threshing, cleaning, &c., before the farmer can realise their money value; yet, inasmuch as they have been acquired by productive industry, they may be deemed developed material. Thus the farmer's stock consists of the undeveloped material, the means of developing such, and lastly the already converted produce, ready for realising to the farmer its money value; this is quite different from the dealer, who simply buys the converted material at a certain price, and realises a profit by disposing of it at a higher, as in the case of the corn dealer, who buys the farmer's corn, say 100 qrs. at 50*s.*, and sells it out retail for 55*s.* or 60*s.* per qr., thus carrying on his business in a manner quite unconnected with productive industry.

[2. Describe the harrow and its uses, and show how this has been developed into the grubber and cultivator. Describe also the characteristics and uses of the latter.]

2. The harrow, an implement second only in importance to the plough, and represented on the small scale by the rake, consists of a frame, and the teeth or tines affixed at certain distances from each other on this frame. The frame may either be made of wood, as in the older constructed implements and the heavy drags at present in use, or of iron, as all the more recent ones. In different harrows, according to their required uses, the frame is heavier or lighter, and of a different form; the former, as regards their being heavy or light, depending on the bulk of material used in the construction of the frame, and also on the means by which the several portions are affixed and bound together, as by cross bracing bars of metal, &c. The form is also very different; in some the bars are parallel, and the teeth, consequently, fixed along at certain distances; or the frame may be of a zigzag shape, which seems to have the advantage of covering the greatest amount of land, with the same quantity of constructing material, and doing it effectually. There are many other varieties of frames, and modifications of these. The teeth, or tines, differ as regards their shape, length, situation, and number. The teeth are usually of a straight perpendicular shape, or, in some few harrows, somewhat curved at the bottom. They should, however, always present an angle to the opposing ground, and, therefore, should be angular; the point or edge always placed in front, so as to have the greatest possible cutting properties. The length depends much on the use; as, in the heavy drags, they should be much longer than in the light seed harrows, usually termed short-toothed harrows. Their situation should be so arranged on the frame that no lump of earth of any material size can escape their action, and moreover being so placed, the harrow allows better of the removal of any weeds and rubbish which necessarily always collects during this operation to some degree.

The number, of course, is of no material consequence, as seldom one harrow is used for an operation, except in the case of the heavy drags, in which they are usually three in number on each row, and there being usually three rows, nine in all is the full complement. It is a point then, however, not to have too many teeth, as, if this is the case, the harrow does not act so thoroughly, and does not go so deep.

The fastenings of the several harrows when united usually consist of a bolt, and also of course there are appropriate fastenings for the horses. The uses to which the harrow is generally applied are those of disintegrating the ground, and breaking up all lumps, &c. Also, as particularly seen in the case of the heavy drags, that of bringing up weeds and rubbish to the surface, removing it from the clods, and dragging it upwards; and lastly, as seen in the short-toothed seed harrows, that of covering in the seed, by raking as it were particles of earth over the seed. These are the chief uses to which the harrow is applied; but there are certain important points as regards their working; thus it is far better to join two or more of the light harrows together, using an extra force in horse labour, than it is to use them singly; thus, first, one harrow by itself, which is four feet broad, acts properly only upon about three feet, the other foot being lost by its jingling, &c., while, if three of such be combined, the full complement of 12, or at least 11, feet are well harrowed; and moreover the operation is better done, inasmuch as the weight is better poised, and in the end requires mostly less horse power, as where one horse is required for one harrow, two will mostly suffice for three. The expressions "double" and "single" tine imply—first, the returning with the harrow in the same breadth of land; and, second, the returning in the next breadth.

This implement, by certain changes, becomes developed into the grubber, scarifier, or cultivator by certain important alterations, which are seen partly perfected in the intermediate implements—the Staffordshire or Cambridge Harrow, and the Biddel's Extirpating Harrow; in the first there are, as it were, two sets of harrows, each having nine teeth, but the teeth are much longer, and are curved to a greater extent; and additionally they are attached to an extra frame in front, with wheels; and stilts or handles are placed behind, by which the workman can somewhat regulate their depth. In the second we have, however, a much nearer relation to the true grubber; the teeth, which are nine in number, placed in rows an inch longer, and the machine is on wheels; additionally it can be raised by means of levers; in short, it may be classed as a true cultivator, though certain peculiarities term it a harrow. In the true cultivator or grubber, as the Biddel's scarifier and the Ducie or Uley cultivator, we have the following characteristic points. *a.* The teeth are much longer; in the 1st they are seven in number, four in front and five behind, while in the second they are either five or seven; but they are much more curved and have a share at the end.

b. The frame is constructed on wheels, and is in both cases of the Biddel's and Uley cultivators made of iron.

c. They admit of regulating the depth to any degree required; in the 1st, by means of complex levers; in the 2d by the use of a screw. In fact, they are of a much larger description, and necessarily fit for different work. The uses to which the scarifier is generally applied are those of digging up land in the place of the plough, and are therefore useful in such cases, as admitting of the operation being done at a much less expensive rate. They are used often instead of a second ploughing, or in some cases instead of it cutting or scarifying up a stubble, though seldom quite sufficient for this work. They are of particular use in running across the furrow slices, routing them up, and breaking them ready for the harrows and drags.

[3. Define a weed, and give the best methods of destroying (1) annual or biennial weeds, (2) perennial weeds. Why does the root crop afford more facilities than any other crop for their destruction?]

3. A weed is a term which may be given to any plant out of its place—whether noxious in itself or otherwise; thus a Turnip is a weed in a crop of Wheat, or *vice versâ*. They are mostly classed as annuals, or biennials, and perennials, inasmuch as it is on these points (the time or stages of growth as biennial or perennial) that a different mode of eradication is indispensably necessary.

1st. As regards the destruction of the annuals and biennials. These weeds, inasmuch as they propagate themselves chiefly by perfecting seed and depositing it (and which, in some cases, as that of the common Charlock, will remain latent in the ground for some considerable period), should be eradicated or removed as much as possible before the time of seeding; and inasmuch as they are mostly of a variety having shallow roots, are the more easily removed by hoeing and such like. The first operation as respects their destruction of course depends much on the means of preparation of the land for the coming crop, and in this case of course the constant ploughing up or otherwise digging up the land and exposing a new surface to the action of the sun, wind, and air, as often as it is economically possible, tends greatly to their destruction—their roots being exposed soon cause them to wither, and ultimately rot. This, of course, is also materially assisted by the use of the drags and harrows separating the weeds from the clods, and still more perfectly exposing their roots, also by the use of the roller, as disintegrating the land when often harrowed. As a means of destruction, the skim plough, which used on this farm in No. 16 and 17, is very effectual, as it goes to a sufficient depth for the extirpation of the roots of the majority of the annuals and biennials. Besides the immediate preceding operations to the sowing of the crop, the autumn fallowing, and exposing to the winter frosts, tend very greatly to their destruction. The after operations, *i.e.*, when the crop is in the ground, chiefly consist of hoeing, either by the hand, or by means of the horse hoe, or by the patent Garrett's horse hoe. These would represent the more common means of extirpating the annual or biennial weeds; but in the case of the perennials often known as root weeds, the case is somewhat different; for, inasmuch as they propagate themselves much by their roots, and in many varieties run to some considerable depth, the treatment must commence immediately the crop has been removed, *i. e.*, the first thing in the autumn, when hands and teams can be spared. The operations would consist in constant ploughings, scarifyings, draggings, and harrowing, so as to earth up the land, expose the roots of the weeds, and afterwards remove them and bring them to the surface, when they may be either carted off or burned on the land in heaps, as the ashes are somewhat valuable. The skim plough is also very useful in this case, but seldom suffices alone. The land, somewhat clean for the autumn operations, is then left during the winter; and the frosts acting on the land render the removal of any weeds still remaining very easy in the spring, which may be done by scarifyings and harrowings. The land is then in a fine tilth, and any Couch or such like can be picked off, and the land is ready for the coming crop. The after operation of hoeing, of course, is of great use; however, it is not of such great importance in destroying the perennials; but still, of course, the operation carried out in the first instance destroys many weeds. The fallowing is of great importance in the extirpating of all perennials—as by such the land can be well ploughed, and the root weeds brought to the surface, and burnt or removed. Of all the crops which come in rotation, none tends to the destruction of weeds better than the root crops; for all the operations I have alluded to can be performed to advantage in preparing land for a root crop. In the first place, the preceding crop is removed in the autumn, and the land can then be constantly ploughed, scarified, and harrowed at different times throughout the season, and it has the benefit of the winter's frosts and all spring cultivation, and in many cases when the roots are not sown till late, the summer's sun acts as though the whole course of a summer's fallow was had recourse to. The land, though not only well cleaned generally, can be well hoed when the roots are up, and this can be continued throughout the summer till late in the autumn, and then any weeds that are hoed up are effectually destroyed by the sun and air. Thus throughout, both as regards the preparation of the land for the crop, and the whole course of after treatment, the weeds can be removed (economically) and to the best possible advantage.

(To be continued.)

FINGER AND TOE IN ROOT CROPS.

BY JAMES BUCKMAN, F.G.S., F.L.S.

(Concluded from page 555).

Degeneracy is usually a result in districts where the original species is a wild native.—The soil, climate, and situation which are suitable for a plant in the wild state are by no means fit for it in cultivation; it is on this account that so many of our esculents may be traced as natives of the sea-coast; the complete change of circumstances attendant upon their inland cultivation are just those which necessitate such a change in the whole growth of a plant as makes the sum of the difference between a wild and a cultivated example; hence, as both Parsnip and Carrot in the wild form are constant denizens of the neighbourhood of Cirencester, neither of these roots can be cultivated twice with us in the soil without presenting finger and toe in an aggravated form; and if the seed employed be from a degenerate crop, or cultivated at home, the evil is still more conspicuous. This, however, is less apparent in garden than in field culture, as in the former the ground is always dug deeper, and there is such a constant change of crop, mode of cultivation, seed, and addition of manure, that the circumstances are widely different

from those in which the species grows wild; beside this, as the quantity of seed required for the garden is less than that for the field, it is uniformly cultivated from good specimens with the greatest possible care; but I have observed that in my college vegetable garden, where, until recently, the plan of cultivation has been but little in advance of that of the field,* finger and toe is a prevailing complaint in the root crops, and from what has been before advanced it will not be considered surprising, seeing that wild Parsnips and Carrots are weeds in the more neglected part of the garden. Still there are circumstances in garden cultivation which strikingly point out that malformed roots are the result of a retrograde approximation to the wild state. If, for example, seed be sown with a view to get Turnips very early, the major part of them frequently run to seed, and the bulbs of those that do not are mostly ill-formed, woody, and quite devoid of that succulency in which excellence consists. Now here, as the time of the germination of the seed, and consequently the period for its growth, approximate more nearly to that of wild nature, it is not surprising that the crop should thereby assimilate to wild results. All specimens of root crops that seed prematurely, thus showing a tendency to annual growth, may be considered as degenerate, and will present the concomitant of finger-and-toe in the root. The drawing, No. 4, which appeared in last week's *Agricultural Gazette*, represents an example of a seedling Carrot from the Royal Agricultural College Farm.

Late-sown roots are liable to produce a degenerate seed.—It is sometimes the practice to let a patch of late-sown Turnips remain for seed; now, the fate of these is not to produce bulbs, and hence some are often so sown purposely for greens. Here we have the seed sown about the time that it is scattered from the wild plants; and it is no wonder that our result should resemble the wild plant in mode of growth, as in such cases we get a small but woody root, which is more or less branched; as, therefore, the object of the crop is the root, we must fail in this if we cultivate a degenerate form.

Different degree of liability to degeneracy in different species.—My observations lead to the conclusion that the smaller the amount of difference between the wild and the cultivated state of a plant the greater the tendency to ramification in the roots, unless the circumstances of the growth of the latter be widely different from that of the wild state. Hence Parsnips on the farm of the Royal Agricultural College will not pay for cultivation; they are wild all around; and as we have seen how great the change by even two years' cultivation from the wild seed, so we have seen the tendency to reversion to their wild form rapidly develop itself by a continuance of the same circumstances. Carrots, however, in their cultivated form present a wider difference from their wild state than do Parsnips; they take a greater time to civilise, and consequently we should not expect them to revert to their wild condition so readily, and indeed, it will generally be found that they die away if left to chance.† As regards Turnips, it will be observed as a rule that any sorts which have often been grown in the same land have a tendency to degenerate; hence, finger and toe will in such cases prevail. New varieties at first maintain their form much better. Swedish Turnips, in their hybrid nature, being farther removed from the wild type on the same ground, will be found to present less tendency to finger and toe than the common Turnips.

General Conclusions.—From the foregoing remarks it will be seen that finger and toe in roots is not viewed by me as a disease, in the strict sense of the word, but as a natural result of the early stage of change from wildness to civilisation. The enumerated experiments seem to show that finger and toe is the midway from wildness to cultivation; and our observations upon the circumstances connected with cultivated root crops, that the malformation in them is the result of degeneration from cultivation to wildness. *Journal of English Agricultural Society*, Vol. IX, Part 1.

* The patch of ground forming the vegetable garden is for the most part situate in a bed of clay, resting on the freestone of the great or Bath oolite, and is only just getting into proper garden work.

† There is on the College Farm, in a waste place by a quarry, a patch of Parsnips derived from a garden which once occupied the spot. I have watched them from the time the cultivation ceased—now five years—and though they get wilder year by year, having roots much forked, yet the leaves are still for the most part without hairs.

Home Correspondence.

The Failure of Mr. Mechi's Grass Crop.—At Mr. Mechi's gathering, Mr. Caird attributed the failure of the Grass crops at Tiptree, as compared with the enormous produce elsewhere, to the assumed fact that 10 inches more rain falls in the west than the east of Great Britain. I believe that the failure is due to a very different cause. First, on reference to the meteorological tables published by the Registrar-General for the three months ending June 30th, it happens that the excess of rain is rather in favour of the east. Secondly, I have seen an instance this year of Italian Rye-grass treated on the self-same system, most luxuriant, in a place only a few miles westward of London. The difference I believe to be in the soil, and not in the rain-fall. The soil at Tiptree is for the most part clay: it was evident, from the greater freshness of the Grass in the furrow, that the liquid was not easily absorbed; and it may be shown that 10,000 gallons of water per acre, equivalent to about half an inch of rain-fall, would not under any circumstances, saturate more than 2 inches of such a soil when dried; besides which, the roots of the plant, in spite of the instinct for which Mr. Mechi gives them credit, would not be able to follow the moisture in so stiff a bed with that ease so essential to rapid growth; hence Mr. Mechi's failure. Irrigation on such a soil, when the surface is broken, as in root crops, may be effectual. The instance of success to which I alluded is at Cassiobury, in Hertfordshire, where Lord Essex has adopted the same system of irrigation. The soil is a loamy gravel, such as is found covering the chalk in Herts, Bucks, Berks, and Oxon; one-third at least consists of angular flints, under and between which the liquid readily finds its way, and saturates the soil more effectually and to a greater depth than in a close clay. If the stones are removed, a network of roots is found under them, denoting a rapid growth after irrigation. It is well known to those who farm such soils, that stones retard the evaporation from the soil beneath them. The soil, a sandy loam, is sufficiently retentive of moisture, and with the aid of its open structure, caused by the flints, enables the roots to work freely and rapidly, and so appropriate the nourishment furnished by the liquid. When the surface is well covered by the crop, the moisture will be more readily retained, and the network of roots will be formed even on the surface itself. It is the nature of the soil, and not the longitude, that must be looked to. If Mr. Caird will visit Lord Essex's farm, he will, I think, agree with me; and I need not remind him that we cannot be too careful to attribute the failure or success of any system to its proper cause. *J. C. C.*

Estimate of Harvest of 1853, compared with the subsequent Imports.—We shall now restate the question, adopting our previous estimate as to the deficiencies of the harvest of 1853, and including the actual imports of foreign Wheat for the last 11 months up to the 1st of July, 1854.

	Quarters.
Assuming our annual consumption of Wheat as 18 million quarters, and the average imports of the past four years as 4½ millions (or 375,000 quarters per month) it gives the home growth as ... ... (the product of 3,857,142 acres, at 28 bush. per acre)	13,500,000
The lessened breadth of Wheat sown for the crop of 1853, as 1-6th, equal to	2,250,000
	11,250,000
Assuming the crop to be 1-4th deficient in yield on the lessened quantity of acres	2,812,000
Making the total growth for 1853	8,438,000
Estimated deficiency of the crop, 5,062,000 qrs. or 37 per cent. on the growth of 13½ million qrs.	
And the required additional quantity of Wheat would be for the 12 months	9,562,000
Total	18,000,000
To meet the above deficiency, we allow for the stock of old Wheat in the hands of the farmer on 1st of Sept. 1853	2,000,000
The Foreign Wheat in granary in London and out-ports	1,200,000
The imports of Foreign Wheat.	
September 600,909	
October 536,473	
November 495,189	
December 411,066	
January 536,173	
February 932,232	
March 738,732	
April 549,650	
May 718,782	
June 420 528	
July 342,000	6,282,034
	9,482,034
The required imports for August will be	80,034
Total	9,562,000

In the above estimate we have made no allowance for the lessened consumption of Wheat from higher prices, or the substitution of other grain for Wheat—believing such consumption has only been lessened to a very small extent—as with the loaf at 9*d.* or 10*d.*, the poorer classes, to a great extent, consume a greater quantity of bread and less of other kinds of food. With respect to the increased import of Wheat in 1853, of 1,755,360 qrs., we allow for 1,200,000 qrs. being in granary on 1st of Sept., and the other half million quarters being used up, by mixing with the inferior quality of Wheat of this country of 1853; and this might in some degree account for the large stock of two million quarters of old Wheat on hand 1st Sept. Whatever may have been the assumed lessened consumption of Wheat from high prices, or the substitution of other grain for Wheat, we feel assured that the failure of the Potato crop in England in 1853, has fully counterbalanced those elements of lessened consumption. *S. Sandars, Hemel Hempstead.*

Wheat in Richmond, Yorkshire.—Since my report on the crops in this neighbourhood was sent in, rust has appeared on Wheat in many places. I have one field which, at the time of sending in my return, I fairly estimated at 40 bushels per acre; on a considerable part of that field rust has appeared, and on that part I do not think there will now be 20 bushels per acre, and that of inferior corn. I have more Wheat similarly affected, and I have to-day seen on a neighbour's farm a field of 25 acres quite as much injured by rust as mine. In other crops I have nothing to alter in my former report. Potatoes are here and there partially affected with disease, but as yet the injury is not extensive. I enclose an ear taken at random from the field of Wheat first named. *H. J. Turner.*

Finger and Toe.—Having just read the last number of the Agricultural Society's Journal, I have been much impressed with the necessity of defining the meaning of terms liable to be misunderstood. There is an article entitled "finger and toe in root crops;" now what is finger and toe? According to Prof. Buckman, it appears a mere forking of the root in Carrots or Parsnips, a case often supposed by farmers in this neighbourhood to arise from the use of long fresh dung in place of fermented, and undoubtedly it does arise at times from a bad quality of seed. But what has this to do with finger and toe, as we understand the term? With us it is a disease resembling the club in Cabbages, and is very common in some parts of the county. When the plants are quite small, it may be felt as a small knot on the root; it soon grows larger, the bulb grows into all sorts of shapes but the right one, and is the abode of insects; the only question with farmers here is, are they the cause or consequence of the disease? If the case I have described is what is usually known as finger and toe, then there can be but little difficulty in proving the theory of Mr. Buckman to be without foundation. I could point out fields that generally have Turnips in this state, and others that had the character of never being free, which now grow good Turnips; now this is without any reference to the character of the seed sown. I know a farm on the oolite, where very deep ploughing has been followed by healthy crops, where none had grown free from disease for many years, and another field in the same farm apparently much benefited by quick lime I have been told by Lincolnshire farmers that the use of cake as feed for sheep has made it much more rare on their lands; whilst in the north Nottinghamshire district, the growing Turnips once in eight, instead of every four years, is the only remedy relied on. Growing Turnip seed, as I do, for the largest farmers of Nottinghamshire, and the neighbourhood of Lincoln, I have no hesitation in saying that if anyone of them could be found who imagined the seed had anything to do with "finger and toe," he would attribute it to an entirely different cause. To the writer in question, he would say the Turnips were too high bred and delicate; and would instance the "hybrid" Turnips, which are said to be more subject to disease than others; whilst the Swede is much less difficult to grow than white Turnips. [You forget that "hybrid" and "high bred" are exact opposites in the vocabulary, whether of the breeder or the physiologist.] Will you be kind enough to state what we are in future to understand by "finger and toe?" Whilst we are discussing the propriety of defining the meaning of terms in common use, will you tell us what is Turnip seed? Is it half or two-thirds killed Rape? The reason I ask this question is because it is generally considered now to be a mixture of dead seed and good seed, in some proportion, like what we used to buy under the name of coffee—part coffee, part chicory. I see in a capital paper on "Light Land Farming," it is recommended to sow from 4 lbs. to 6 lbs. of Turnip seed per acre. Were the seed known to be genuine, it is, I will venture to say, impossible to point out an instance where it is requisite to sow 6 lbs. of seed per acre, much less on light land; and it only shows how general must be the system of adulteration which would lead a clever man to recommend such a quantity. There are hundreds of acres in the neighbourhood sown with from 1 lb. to 1½ lb. per acre where the land is light and in good condition; the common quantities are 2 lbs. of white, and 2½ to 3 lbs. of Swedes. The largest quantity I ever heard of being sown on clay land was 4 lbs., and this was on account of the fly, and caused a great deal of discussion at the farmer's table. *J. R. Pearson.*

Dipping Apparatus.—Seeing that a correspondent asks for information respecting a dipping apparatus, I forward you the subjoined remarks descriptive of a very simple method of procuring one. Having to dip about 500 sheep annually, I drew a plan about three years ago from which a carpenter under my own direction made an apparatus. It is made throughout of the best red wood deal; the planks joined by groove and tongue, the interstices filled with putty. It is made of inch-and-a-half stuff, the ends, sides, and bottom morticed together. Its inside measurement is 4 feet 6 inches by 2 feet 6 inches, and 2 feet 6 inches deep. The bottom or floor of the rack is also grooved and tongued. The rack itself is composed of 15 wedge-shaped pieces, tapering from 5½ inches to 2 inches, the upper side left perfectly square; the whole rack made of inch-and-a-quarter stuff, the spaces between each wedge 2 inches within a fraction; they are nailed to the floor from below. The trough is cut down about 1½ inch along one side to admit the rack, which is supported at the other end by two moveable feet, about 3 feet long, which gives sufficient inclination to produce a rapid fall of the liquor back into the trough. The whole well painted with red-lead. I generally place a large door for the sheep to walk down when finished. I am not perfectly certain, but memory suggests between 30*s.* and 40*s.* as the price at that time. *Clathrus Celatus, Aug.* 25.

Exports from Odessa.—I see that in your last number you have drawn attention to the great increase in the exportation of Wheat from Odessa. Your figures are worth repeating:—Exports from Odessa in 1851, 800,000 qrs.; ditto 1852, 1,400,000 qrs.; ditto 1853, 3,160,000 qrs. The fact is that the corn trade of Southern Russia was being ruined by the competition of Wallachia and Moldavia. Hence the attack upon Turkey. Russia has destroyed two harvests in the Turkish provinces, and consequently the Odessa exports of Wheat have increased fourfold since 1851, and a sufficient profit has been made to cover the additional expenses caused by the war. *T. M., Aug.* 27.

Societies.

EDUCATIONAL EXHIBITION.—ST. MARTIN'S HALL, *Aug.* 29.—*The Policy and Possibility of Agricultural Instruction in our Common Country Schools.* Mr. Morton gave a lecture on this subject.—The policy of the thing was to be defended by the same argument as that which justified technical and professional education of any other kind. The possibility of it was limited by the humble means within reach of the teachers of such schools, and by the generally early age at which the labour of children in the fields becomes valuable enough to induce their parents to remove them. The propriety of attempting the agricultural instruction of children in country districts depended on the value of intelligence in agricultural labourers as in all other working men, both to themselves and to their employers. At present boys in the first years of their service are "more plague than profit," the farmer having then to do the work of education for them imperfectly, which might have been better done by the teacher. The ignorance of grown up labourers is often the limit to the successful progress of the farmer. A man who has farmed successfully in Scotland comes south and fails "because of our climate," it is said, and "because of our English clays," neither of which are compatible with Scottish management. Yes, but often and in great degree, because he has not the same machinery here that he could command there; and it is not the implements but the men that are referred to. The more intelligent labourers whose services he could have in Scotland, are, as it were, "self-acting tools," needing but to be "set" correctly at first, and then going through the work correctly to the end. Exchange them for ignorant and uneducated men, and you cannot be sure either that your instructions are understood at first, or will be attended to longer than your superintendence is continued. Lastly, the education of labourers is desirable for its reflex influence on that of farmers, and agricultural ignorance attacked in the van by such institutions as the Royal Agricultural College of Cirencester, and in the main body, it is to be hoped, by schools urged on by Lord Ebrington's scheme of district examinations, under the superintendence of the Society of Arts, will be all the more effectually routed if also attacked in the rear and from below by the efficient education of the labouring class.

The only objections, then, that can be offered to the policy of attempting this must come from those who deny its possibility; and to the consideration of that the rest of the lecture was devoted. The case of a teacher in a country district was supposed; and his means both for self-instruction and for communicating instruction were enumerated. He had friends among the farmers—he had the school garden, he had a few simple pieces of apparatus, he had the aspects of nature all around him, varying with season, soil, and skill; and, lastly, he had his books. The works named were Johnston's "Agricultural Chemistry and Geology," Low's "Elements of Practical Agriculture," Stephens' "Book of the Farm," access to which might be had in some neighbouring library—and then for class books there were "The Farmer," by G. Nicholls; Richardson's shilling Rural Hand-books, "Blacker on Small Farms," &c. The instruction of the teacher was of course the main difficulty. This must be done by properly qualified instructors in our normal schools, as is being done in the normal schools at Edinburgh and Glasgow, where men trained at Glasnevin College are employed. Letters were read on this subject from Dr. Kirkpatrick of Glasnevin, D. Milne Horne, Esq., of Coldstream, and J. Gordon, Esq., Secretary to the Committee on Education of the General Assembly of the Church of Scotland. Then, supposing a qualified teacher, the means at his command of instructing others were discussed. Specimen lessons were recited in the main truths of agricultural chemistry, showing how doctrines in the theory and facts in the practice of agriculture were capable of satisfactory, simple, and even amusing illustration, without the employment of a scientific nomenclature, or the use of any other than common-place and familiar instances and terms. The uses of the garden in agricultural instruction were proved both by testimony and experience. Dr. Daubeny's illustrations of the exhausting power of plants, in his lectures before the English Agricultural Society, were taken from *garden* plots. Tull's argument was built originally upon observation of *garden* rows and single plants. The most complete and satisfactory inquiry into the relative values of our Grasses was conducted by Sinclair in the Woburn *Gardens*. One of the most perfect inquiries into the relative values of our Wheats is reported in the first volume of the Journal of the English Agricultural Society as having been carried out in a *garden* in Gloucestershire. Experiments on manures in *gardens* are perfectly satisfactory. What can be more so than the valuable annual report of a *garden* experience given for many past years in the *Agricultural Gazette* by the Hon. and Rev. L. V. Harcourt. Modes of culture, then, methods of manuring, rotations of cropping, and the merits of the various crops—all these particulars which among them pretty nearly complete the circle of the mere cultivator's experience—are capable of perfect illustration in a garden. And how perfectly the *rationale* of many an operation can be thus presented to both mind and eye can be easily imagined. You may talk to a boy by the hour on the advantage of stirring the soil and of deep cultivation, inasmuch as it admits the air more perfectly throughout the substance of the soil, and thereby facilitates the chemical processes by which the soil and its contents are fitted as the food of plants; but no quantity of merely verbal instruction will equal in its force, either upon the understanding or memory, the lesson on that subject which that same boy would receive if after having dug a hole in the hardened ground he were told to put into it again all the earth he had just taken out of it. *The heap remaining over* which he could not return to its place would represent more distinctly to him the bulk of additional air thus introduced into the soil by its disturbance than any argument unsupported by this simple experiment could do.

The uses of the garden in furnishing practice in the use of tools were proved by the experience of schools in the Highlands and in Ireland. Its uses in adding to the means of the school, or the emoluments of the teacher, were proved by reference to the experience of Mrs. D. Gilbert's schools in Sussex; by the experience of Mr. Batson, late of Kynaston House, in Herefordshire, who lodged, maintained, and instructed boys upon his farm, being repaid by their labour; and by the experience of reformatory schools, the one especially referred to being that at Hardwicke, near Gloucester, now for several years maintained in operation by the wise and painstaking benevolence of Mr. Bengough and Mr. Baker, two magistrates of Gloucestershire.

Lastly, the fact that agricultural instruction *can* be given without endangering the efficiency of the ordinary literary instruction was proved by the testimony of such men as Dr. Kirkpatrick and Mr. Gordon. The policy of giving the latter an agricultural turn by the use of *agricultural* reading books and *agricultural* arithmetic books in our rural schools was adverted to. The value of evening schools for adults, as meeting the deficiencies arising from a too early removal of children to work, and as in some degree a successful rival of the public-house, was insisted on, and Mr. Morton concluded by quoting a saying of the Dean of Hereford, "I am perfectly convinced that many well-meaning efforts in the education of children have not been attended with the success expected from them, entirely owing to their leaving out all instruction relating to the occupations by which they are in after life to earn their bread."

Farmers' Clubs.

WAKEFIELD.—*The most desirable kinds of Spring Food for Cattle.*—At a late meeting of this Club, Mr. Bottomley introduced this subject:—If farmers obtained a good crop of Turnips they could keep them a long time. The Turnip was, after all, the principal Spring crop, and he should be sorry to see any attempt to supersede it. He rather considered that farmers should endeavour to find other plants that would range along with it. The second article he should recommend, to follow Turnips, was Mangold Wurzel, and he had found upon this point some amount of difficulty in convincing farmers of its importance. It would be found, however, that the Mangold Wurzel would succeed by perseverance. It required to be got into the ground from the first week in April to the last. The present season had been a remarkable one. There was scarcely a farmer amongst them but had found that the land was in advance of the season. Turnip seed could be got in later. With regard to Mangold Wurzel, suppose a person had a given number of acres of fallow,—if he was able, by cleaning in the back end of the season, to get 5 acres out of 20 planted with Mangold Wurzel, then he had only 15 acres of Turnips to be anxious about. With regard to the produce of Mangold Wurzel, he (Mr. B.) could speak from 12 years' experience—he had been uniformly successful with his crops of Mangold. Most of the farmers present would agree that the past season had been very trying in respect of spring food for cattle. The Turnips had failed them before they had anything else ready for the cattle. Frost had done the Turnip crop an immense deal of harm. He did not find that the same untoward result had happened to Mangold. Mangold Wurzel was about 20 per cent. superior to Swedes in nutritive matter, weight for weight, but ought not to be used before March; they improve in quality, as a Swede deteriorates. He steeped his seed two nights and a day before dibbling it. There was no doubt that a variety of food was beneficial in the feeding of cattle, and this was also another argument in favour of the growth of Mangold. In changing, however, their food, it was advisable not to do so very suddenly. The food might be mixed for a week or two, and then changed. In the third place, he advised that about a rood or half an acre should be planted with Thousand-headed Cabbage for the cattle. He had also grown the Drumhead, or Scotch Cabbage, for the same purpose. The nutritive properties of Cabbage, in the feeding of cattle, were often underrated; it was a great deal more nutritive than was generally supposed. If the club were generally informed of the quantity that could be grown upon an acre of ground, they would be very much astonished. He did not know anything that would be of greater value to the ewes than that crop. In the next place he was of opinion that a crop of Tares, mown and chopped with hay or Clover, is not only much better for horses and cattle, but will go a great deal further in the using of them. The early crop may be got off in time to plant Cabbage or Thousand-head in succession. He had now recommended Turnips, Mangold Wurzel, Cabbages, and Tares. In respect to the Cabbages, he might observe that the Thousand-headed Cabbage was recommended to sheep-keepers far before others; but for cattle, the Drumhead was decidedly superior. These were valuable food for the whole of the winter. A farmer generally thought that if he got plenty of Turnips he was well off. He found that Flemish farmers, whose farms were generally very small lots, uniformly got good crops of Cabbages, and also usually obtained two crops per year. If the plan of cultivating Cabbages, therefore, was so successful in small experiments, why should not the trial be extended, say upon 4, 5, or 6 acres of land? A farmer, who had a 4-acre field near home, might thus make it very productive. If the plants were purchased, it would be as well to put them in a little water after they had been carried a number of miles, and until they were ready to plant. When they were grown at home, of course they did not need water at all. There was no difficulty at all, and very little expense, attending their cultivation. Scarcely any of those gentlemen present ever yet raised a crop of Turnips but that they found some deficiency in it—some places where the seed had not come up. Well, that had often been the case with him; and when there was a wet day, when his men could not go out on the ground, he gave them a few Cabbage plants, and made them dibble them in among the Turnips, wherever they found a bare place. Cabbages were always very nice eatage for sheep and lambs. He had recently been in Notts, and had seen the liquid manure drill in operation there, where it had given the greatest satisfaction. Farmers with whom he was acquainted were doing 7 acres a day with its assistance, and hoped soon to achieve 8 acres per day. It was considered a likely implement to answer well in Notts. In Notts there was a great deal of Tares grown. They were chopped up with hay for the cattle, and capital eatage they formed. If this variety of food succeeded so well there, and if it was found so useful, he did not see why it should not also succeed in Yorkshire. After Tares, it was possible to raise for next spring a very good crop of Thousand-headed Cabbages for sheep, or the Drumhead or Scotch Cabbage for cattle. This last spring would have convinced them that a rood or half an acre of Cabbages would have been invaluable, in consequence of the scarcity of other spring food.—Mr. J. Simpson, of Ackworth, agreed with what Mr. Bottomley had advanced. As to Mangold Wurzel, this year was the first time he had tried for some years. He had dibbled in his Mangold; and he did not know the reason (perhaps the season had been too dry for them), but his crop had not succeeded to the extent he could have expected. With respect to Thousand-headed Cabbage, he quite agreed with Mr. Bottomley as to the desirability of this being employed as spring food. Last year he had planted half an acre of Thousand-headed Cabbage after Tares, and he had found them very useful during the past spring. Where any one had a large stock of ewes, these could be turned on the Thousand-headed Cabbage, and they would find the advantages of the crop. He had done so, and found the ewes highly relished the food. This year he had got more of the Cabbage set, and it was now ready for transplanting out. He intended having an acre or two this year. Variety of food for cattle he thought very beneficial.

Miscellaneous.

Travelling of Eggs.—When sittings of eggs are forwarded by railway or other public conveyance, it is customary to pack them tightly in bran, with considerable spaces between them; others recommend Oats to be used. My own experience is most decidedly in favour of hay or soft straw, which by its elasticity prevents all shaking, and enables the eggs to be forwarded any distance without injury. This season I forwarded two sittings of eggs to the far north of England, one packed most carefully in bran, the other in hay; of the first not one egg hatched, whilst every one of the second produced a chick; and a sitting that I received this season, which was similarly packed, every egg was fertile, although the basket had travelled from the north by coach, rail, and carrier. *Tegetmeier's Profitable Poultry.*

Crop of Mangold Wurzel in 1854.—Prizes of 4*l.*, 3*l.*, and 2*l.* were given by the Manchester Agricultural Society in the following instances:—To Mr. Robert Birch, Netherton, near Liverpool. This claimant's farm contains 242 acres, and he had four acres in Long Red Mangold Wurzel, on land which had been Clover the previous year. The soil was a good deep loam, on a subsoil of clay, sand, and foxbench, well drained. The drills were 25 inches apart, and the bulbs 10 inches. Four lbs. of seed were dibbled in early in April. Twenty-two tons per acre of the best farm-yard manure and 3 cwt. of guano had been applied. Crop and land very clean, bulbs sound, well grown. Average weight, 50 tons per acre. Weighed November 11, 1853. To Mr. T. Atherton, Speke, near Liverpool. The claimant's farm contains 146 acres, and he had three acres in Mangold Wurzel. Previous crop, hay (three years old Grass). Soil a good deep sandy loam, on a subsoil of sand and gravel, well drained. Drills 27 inches apart, and the bulbs 12 inches. Three lbs. of seed of the Long Red kind was dibbled in, in April; 25 tons of night-soil per acre were applied in the autumn, and 25 tons of cow-dung in the spring, with 1½ cwt. of guano. The crop could scarcely be finer in any respect, or the land cleaner. Average weight, 52 tons 13 cwt. 2 qrs. 8 lbs. Weighed November 15, 1853. *Journal of Manchester and Liverpool Agricultural Society.*

Calendar of Operations.

AUGUST.

LAMMERMUIR SHEEP FARM, *Aug.* 23.—Cheviot lambs are now all weaned, and the wedder lambs, when not kept for a wedder hirsel, disposed of. The ewe lambs are separated from their mothers for 10 days or a fortnight, till the milk goes off the ewe; they are then returned to the flock, when most of them mother again, and keep close company, though they do not suckle. The practice of ewe milking is now nearly extinct, though within the last 20 years it was customary to milk them for a period of six weeks or two months, and that twice a day. The damage done to the ewe fully counterbalances the value of the cheese produce, and the trouble and labour are enormous, especially where the hirsels are large. When this practice was everywhere carried out, it was also customary to fold the ewes at night on Grass-land, intended for corn the following year. The ewes thus spent 14 hours out of every 24 within flakes. It is satisfactory to observe that this barbarous mode of management has now all but disappeared. Wool has this year generally weighed light, and the price about 10*s.* per stone less than last year, so that hill clips return one-third less money than last year. The weather for the last 10 days has been very broken and most unpropitious for winning and securing hay. Natural hay, which in this neighbourhood is greatly depended on for winter meat for sheep, is a very abundant crop, and if well secured will see us through a long storm. The Turnip crop looks uncommonly well. *J. B.*

SOUTH DEVON, *Aug.* 29.—We are now in the midst of the finest harvest known for some years past, as far as the weather is concerned, and every one is busy either cutting or carrying. Corn has generally given up with a rich gold colour, which augurs well for the yield; it is, however, early to give a decided opinion, but I must say appearances make one doubt Wheat being an average crop. Barley and Oats are an average crop, and the Barley sample has much improved by the fine weather. For reaping Wheat, from 6*s.* to 7*s.* per acre, and 8 quarts of cider for cutting, bringing, and standing up, appear to be the usual charge. For mowing Barley and Oats, from 2*s.* to 2*s.* 3*d.*, and 3 quarts of cider per acre. We are now beginning to suffer much from the dry weather in the Grass lands, and the country carries a very parchy look, making frequent change and water the only chance of improving the condition of our cattle. Green crops altogether look well, but are certainly not so far on as the 1st of September generally leads one to expect; this, and the great scarcity of partridges everywhere, will give our sporting friends a troublesome day on Friday. Turnip hoeing appears to have been done at from 4*s.* 6*d.* to 5*s.* and 4 quarts of cider per acre. The Potatoes are much diseased, but a good yield. Our Apple crop is unfavourable; they do not appear to grow, but fall off the trees as if blighted. I doubt if it will reach a quarter crop. Prices of agricultural produce continue much about the same, with the exception of Wheat, and may be quoted as follows:—Per quarter, Wheat, 64*s.*; Barley, 40*s.*; Oats, old, 29*s.*; Oats, new, 25*s.* 6*d.*; Beef, 60*s.* per cwt.; mutton, 6½*d.* per lb. *J. M.*

WESTER ROSS, *Aug.* 28.—On the earlier farms harvest has been commenced, and in a few days it will be general. We are about a week later this year than last, and last year was some 10 days later than the previous one. We may expect soon to reach, if we have not already reached, the lowest part of the revolutionary cycle. The great proportion of the crop in this county is still cut with the sickle, and this year, although wages are somewhat higher, the crop can be cut and stooked at an expense of 8*s.* an acre. Hitherto we have had hands enough not only to meet our own requirements in our busiest season, but hundreds of our people went annually to the more thinly populated districts to assist the good folks in cutting and securing their crops. The stream of emigration flows on, the number of work-people is lessening, and the time bids fair to come more speedily than we would desire, when we will not only be unable to give our neighbours any redundant hands, but when, unable to get hands sufficient to cut our crops in the old fashion, we will be anxiously asking where can we find the most satisfactory reaping machine. In the meantime, and until reaping machines be still further improved, mowing becomes more general, and with the scythe an acre can be cut and stooked for 5*s.* Fields that are already cut are thickly stooked; there will be no lack of straw. Oats will be an incomparably better sample than last year. Barley seems well filled; and Wheat, except where it was early lodged, will thresh out largely, although it can scarcely be expected that the sample will be so fine as it is in drier and sunnier seasons. Much still depends on the weather in the weeks of harvest. We have had lately a few dry, good working days, but, on the whole, this month has been wet and ungenial. Turnips have received fully their ordinary share of attention, being more difficult to clean in a moist season. They have been making rapid progress, and are likely to be fully an average crop. A month hence we can speak more confidently of many of these matters. Of one part of the crop we can now speak pretty confidently. We can advise the inhabitants of large towns to place no dependence on the north for any part of their Potato supply. Last year we profited more by Potatoes than in any former year; this year the loss will be greater than in any previous one. They have been arrested in the middle of their growth, and already about one-half of the tubers is diseased. Somewhere about one-fourth of an ordinary crop remains sound, these being small and wet, and of their ultimate soundness we have good reason to be afraid. Notwithstanding, with an abundant grain crop, a plentiful supply of keep for stock through the winter, and with an expectation of fair prices for both corn and cattle, we manage to demean ourselves with becoming cheerfulness.

Notices to Correspondents.

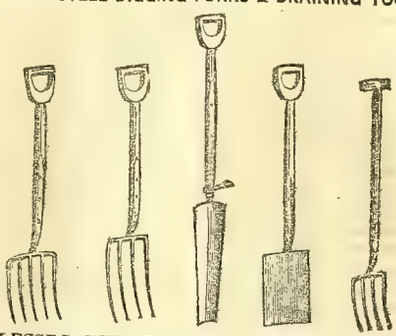
ADULTERATION IN FLOUR: *Darlington.* Will you send us the particulars. Can you not fill up your blanks and let us know what the deleterious things and processes are? How do you connect the illness you describe with the man's food? It is useless to insinuate and suggest, you must *bear witness* frankly, if any good is to be done by publication.

BOOKS ON THE SUBJECT OF AGRICULTURAL INSTRUCTION.—*For the information of the Teacher:* (1.) Johnston's Lectures on Agricultural Chemistry and Geology; (2.) Stephens' Book of the Farm; (3.) Low's Elements of Practical Agriculture. *For use as Class Books:* (1.) Johnston's Catechism of Agricultural Chemistry and Geology; (2.) The Farmer, by G. Nicholls; (3.) Essay on Small Farms, by Mr. Blacker, of Armagh; (4.) Hints on Agricultural Economy, by O. O. Roberts; (5–9.) Richardson's Rural Handbooks on the Horse, Ox, Sheep, Hog, Farm Pests, &c. *On the Practicability of Uniting Agricultural and Literary Instruction:* (1.) Reports by Dr. Kirkpatrick to the Commissioners of National Education in Ireland; (2.) Report by J. Gordon, Esq., on Ayrshire, in the Minutes of Council on Education for 1846; (3.) Report of the Educational Committee of the General Assembly of the Church of Scotland on Agricultural Schools, 1853–4. Blackwood, Edinburgh. *Experience on the Profits of Boys' Labour in the School Garden:* (1.) How to improve the condition of the Agricultural Labourer. A self-supporting system, by which boys may be trained in arts of industry, and at the same time receive a suitable education. By T. Batson, Esq., of Colley House, Exeter. Groombridge, 1851; (2.) On increasing the demand for Agricultural Labour. By C. W. Johnson, Esq. Ridgway, Piccadilly; (3.) Manual of Field Gardening in Sussex and Yorkshire. Printed and sold by T. Kemp, Huddersfield; (4.) Report and Rules of Reformatory School, Hardwicke. E. Power, Westgate Street, Gloucester.

HARE RABBITS: *Constant Reader.* Youell & Co., Great Yarmouth, advertised these.

ERRATUM.—For "floret," p. 553, col. *c*, lines 16 and 18 from bottom of leader, read "spikelet."

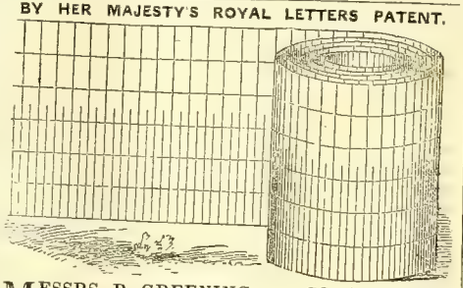
PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work; free from liability to choke, or get out of order. May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

BY HER MAJESTY'S ROYAL LETTERS PATENT.



MESSRS. B. GREENING AND CO. beg respectfully to call attention to their superior WIRE FENCES, of which the following are the principal varieties:—Portable Horse and Cattle Fencing (Economical variety of ditto), Portable Sheep and Lamb, Proof Fencing, Poultry Fence, Portable Hare and Rabbit-proof Fencing, Ornamental Garden Fences, Export varieties, Poultry and Chicken-proof Fencing. Light and cheap kinds of most of the above. Trainers for Peas, &c., Garden Bordering, Tree Protectors, Hen Houses, Poultry and other Aviaries, &c.
Messrs. B. G. & Co being the sole patentees for the machinery for manufacturing these Fences, will forward engraved sheets of Patterns, Prize Lists, Prospectuses, &c., gratis, on application to their establishments, 1 and 3, Church Gates, or 2 and 2 A, Cateaton Street, Manchester.

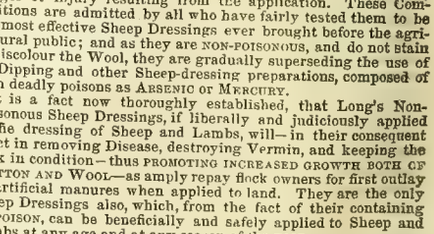
No. 11.
No. 14.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.
JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical only for small houses.
No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.
Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

WEDLAKE'S OAT-CRUSHERS, CHAFF-CUTTERS, CARTS, HARROWS, PLOUGHS, and FLOUR MILLS.—118, Fenchurch Street London.

IMPORTANT TO



FLOCK MASTERS.
SHEEP, LAMBS, HORSES, AND CATTLE,
CAN BE DRESSED WITH
LONG'S NON-POISONOUS SHEEP & CATTLE-DRESSING COMPOSITIONS, without any possibility of danger or injury resulting from the application. These Compositions are admitted by all who have fairly tested them to be the most effective Sheep Dressings ever brought before the agricultural public; and as they are NON-POISONOUS, and do not stain or discolour the Wool, they are gradually superseding the use of all Dipping and other Sheep-dressing preparations, composed of such deadly poisons as ARSENIC or MERCURY.
It is a fact now thoroughly established, that Long's Non-Poisonous Sheep Dressings, if liberally and judiciously applied in the dressing of Sheep and Lambs, will—in their consequent effect in removing Disease, destroying Vermin, and keeping the flock in condition—thus PROMOTING INCREASED GROWTH BOTH OF MUTTON AND WOOL—as amply repay flock owners for first outlay as artificial manures when applied to land. They are the only Sheep Dressings also, which, from the fact of their containing NO POISON, can be beneficially and safely applied to Sheep and Lambs at any age and at any season of the year.
Pamphlets, containing full directions for use, and copies of the strongest Testimonials ever accorded to a manufacturer, signed by leading and practical Stock Farmers, residing in all parts of the United Kingdom, together with the names of all Country Agents authorised to vend Long's Patent Sheep and Cattle-dressing Compositions, may be obtained gratuitously on application of any advertised country Agent; or by post, sent free, of
BARRY BROTHERS, AGENTS FOR JOSEPH LONG,
Meriton's Wharf, and Shad Thames, London.

TO FLORISTS AND OTHERS.

J. JONES, IRON MERCHANT, has always a great variety of CONICAL and SADDLE BOILERS in STOCK; also Fire and Furnace Bars, Ornamental and Plain Supply Cisterns, Double Doors and Frames, Furnace Grates, Soot Doors, Hot Water Pipes, Elbows, Tees, Syphons, Throttle Valves, Stop Cocks, Flange and Socket Elbows, &c.; also Trough Pipes. Drawings and prices of the above, on application to J. JONES, Iron Bridge Wharf, No. 6, Bankside, London, near the Southwark Iron Bridge.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, 296, Oxford Street, London.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each; Large size, for Gardeners' use, **25s.** each.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated, and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

39, OXFORD STREET (corner of Newman Street); Nos. 1, 2, and 3, NEWMAN STREET; and 4 and 5, PERRY'S PLACE.

IF YOU WANT LUXURIANT HAIR, WHISKERS, &c., use DR. DE CASTRO'S LIXIVIAL EXTRACT, the only Compound for the Hair ever issued by a Physician, and approved of by the Faculty. In hundreds of cases it has succeeded where everything else has failed in restoring the Hair, however it may have been lost, preventing its falling off, strengthening it when weak, neutralising scurf and dandriff, and checking greyness. For the speedy production of Eyebrows, Whiskers, Moustachios, &c., its operation is positively certain. Sufficient for two months' use sent free by post on receipt of 24 penny post stamps, by Dr. DE CASTRO, Hornsey, Middlesex. Persons who have been deceived by the various oils, pomades, &c., now advertised, are earnestly invited to try this Extract. A Quarterly Report of Cures, Testimonials, &c., sent, post free, for a stamped and directed envelope.

BLAIR'S GOUT AND RHEUMATIC PILLS. Price 1*s.* 1½*d.* and 2*s.* 9*d.* per box.—Mr. William Courtney, of Barton, Stacey, Hants, says:—"I had resort to your Pills, and within two hours I was quite easy. The use of these Pills ought really to be known all over the world." Among the many discoveries, none have conferred such a boon upon suffering humanity as that of Blair's Gout and Rheumatic Pills, they require neither attention nor confinement, and are certain to prevent the disease attacking any vital part. Sold by all medicine vendors. Observe that "THOMAS PROUT, 229, Strand, London," is impressed upon the Government stamp

TO BE DISPOSED OF, Six CYGNETS in very fine condition, and of good size.—Apply to H. T. HUMPHREYS, Kilmacow, Waterford.

TO JOBBING GARDENERS, FLORISTS, &c.

TO BE SOLD, a BUSINESS, established 30 years, in the fast-improving neighbourhood of New Brompton, consisting of about half an acre, with Stock, two Greenhouses, Pits, and Dwelling House, unexpired lease, rent 24*l.* per annum, to be taken either by valuation or agreement.—Apply to Mr. W. KEMP, News Agent, Fulham Road, New Brompton.

WANTED, to Rent on Lease, Eight or Nine Acres of MARKET GARDEN GROUND, with Dwelling House, Sheds, &c. (small quantity of Glass no objection), within 8 or 9 miles of London.—Address, with particulars, A. B, Post-office, Ealing, Middlesex.

KENT.—NEAR A GOOD MARKET TOWN.

TO BE LET, for a term of 11½ years, a light LAND FARM, of nearly 180 Acres, in a good state of cultivation, with a modern Residence and Homestead.—For further particulars and terms, address to E. KEMMOCK, Kingston-on-Thames.

FARM AT HARROW AND STANMORE, MIDDLESEX.

TO BE LET ON LEASE, from Michaelmas next, the KENTON LANE FARM, containing about 330 acres of excellent Pasture and Arable Land, with a highly respectable Farm Residence, convenient Farm Buildings, and Cottages. One mile from the Harrow station.

Tenders to be sent to Mr. WILLIAM WIX, Clerk, St. Bartholomew's Hospital, on or before the 8th September, from whom further particulars may be obtained; or from Mr. TATHAM, Land Surveyor, 27, Bedford Place, Russell Square, London. References will be required.

WILLIAM WIX, Clerk, Bartholomew's Hospital, Aug. 31.

MITCHAM, SURREY.

TO MARKET GARDENERS, MEDICAL HERB-GROWERS, AND OTHERS.

TO BE LET, with possession at Michaelmas next, a good mixed soil FARM, containing 122 acres, admirably adapted for either of the above purposes, with Residence and Homestead attached, only 8 miles from London, and 3 from the market town of Croydon.—May be viewed by permission of the tenant, and particulars had, on application to Messrs. CRAWTER, Land Agents, Surveyors, &c., 5, Bedford Row, London.

HAMPSHIRE.

TO BE LET, for a Term of seven or 13 years, a GENTLEMAN'S RESIDENCE, containing 11 Bedrooms and three Sitting Rooms, Bath Room, &c., with 165 Acres of Arable Land, 72 of Park and Meadow, and 150 of Woods and Plantation. Excellent shooting. The whole is in superior order, and has all modern improvements, with the great advantage of immediate proximity to a railway station, and within 1½ hour's journey of London.—Apply to Mr. CHARLES SPRIGGES, Auctioneer, 19, Brook Street, Grosvenor Square, London.

TO NURSERYMEN AND OTHERS.

TO BE LET, situate at Epsom, in Surrey, NURSERY GROUND, &c., late in the occupation of Mr. C. Young.—For particulars, inquire of Mrs. WILKINS, 60, Queen's Row, Walworth, Surrey.

A MOST EXCELLENT LIVING.

LIVING PLANTS AND SEEDS FROM ANGOLA.

MR. S. STEVENS, NATURAL HISTORY AGENT, &c., 24, Bloomsbury Street, London, begs to announce that he has lately had consigned to him FOR SALE, from the well-known botanist Dr. Wellwitsch, a small parcel of LIVING PLANTS, consisting of Terrestrial Orchids, Euphorbias, Aloes, Urginias, Crinums, Amaryllis, &c., in all 13 varieties, mostly in good order, and supposed to be new, which he offers for sale at 2*l.* 10*s.* the set. Latin descriptions accompany each plant.

Also a COLLECTION of SEEDS in fine state, consisting of about 110 varieties, with Latin descriptions to each packet; many of them are believed to be quite new to this country. They have been made into 10 sets, price 5*l.* the set.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS beg to announce that they have received instructions from the administrators of the late Mr. W. Watts, of Stoke Newington, to sell by Auction, early in OCTOBER next, the whole of his unrivalled NURSERY STOCK, Greenhouses, and sundry effects. Further particulars will appear in future advertisements.

N.B. The unexpired Lease of the BARRETT GROVE GROUND, of 4 acres, will be submitted to public competition at the same time, unless previously disposed of by private contract.—For particulars apply to Mr. MACKAY, Stoke Newington, or of the Auctioneers, American Nursery, Leytonstone, Essex.

CLAPHAM.

TO NOBLEMEN, GENTLEMEN, EXHIBITORS, NURSERYMEN, & OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the administrators of the late Mr. Joseph Fairbairn to submit to an unreserved Sale by Auction, on the premises, the Nurseries, Clapham, near London, on TUESDAY, Sept. 19th, 1854, and following day, at 11 o'clock each day, the valuable stock of Choice GREENHOUSE and STOVE PLANTS, which is particularly worthy the attention of noblemen and gentlemen enriching their collections, as well as the trade, from its excellence, comprising about 4000 fine Ericas, of all the leading kinds, amongst which are magnificent specimens of Massoni, Massoni major, Tricolor elegans, Cavendishi, Templæa, Meniæflora, Douglassi, Easonia purpurea, Austiniana, Vestita coccinea, Aitonia Turgida, Princeps Templæa, Murrayana, Favoides elegans, Ferruginea, Ventricosas, sorts, &c.; also 500 choice Azalea indica, 1000 double Camellias, 1000 Epacris, 500 Aphelexis, Mitraria coccinea, Acacia, Chorozema, Dillwynia, Diosma, Lilium lancifolium, &c. &c.—May be viewed two days prior to the Sale. Catalogues to be had (6*d.* each, returnable to purchasers) on the Premises; at the Shop, High Street, Clapham; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex. N.B.—The Lease of the old-established Seed Shop and Nursery to be Sold; the Stock to be taken by valuation or agreement For particulars, apply to the administrators; or Mr. JAMES FAIRBAIRN, on the premises

ON MARRIAGE.
Just published (to be had free, by enclosing 1s. or Twelve Postage Stamps, to Mr. WATSON, Clerical Agent, Robert Street, Adelphi, London).
MATRIMONY.—A Pamphlet on Matrimonial Alliances, which merits the attention of those who wish to settle honourably in life. By a Clergyman.

HOSE PIPING.—GREAT REDUCTION IN PRICE.
PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense pressure, and much more than leather, vulcanised rubber, or any other hose, and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the public.
BURGESS AND KEY, 103, Newgate Street, and 52, Little Britain, who, on application, will forward wholesale and retail prices.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.
SAMUEL CUNDY, MASON AND BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place Pimlico, London.
Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c Circulars sent on application.
N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

ENCAUSTIC TILE PAVEMENTS.
MAW AND CO., Benthall Works, Broseley, Salop, Manufacturers of the Cloister Pavement of Mediæval Court, and "THE SUCCESSFUL IMITATION OF OPY'S ALEXANDRINUM, IN THE BEAUTIFUL ENCAUSTIC TILE PAVEMENT OF CLOISTERS OF BYZANTINE COURT," Crystal Palace (M. D. Wyatt, Esq., in Official Handbook), forward, without charge, Designs and Estimates, adapted to given dimensions, of Entrance Halls, Conservatories, Verandahs, &c., in every style.
Specimens at 11, Aldersgate Street, City.

MESSRS. J. WEEKS' NURSERY, KING'S ROAD, CHELSEA.—A great alteration is being effected at this Establishment, where the various Horticultural buildings spread over nearly an acre of ground, and extending together to about 770 feet in length, covering an area of 20,000 feet, have hitherto been heated by seven boilers. These boilers worked efficiently and economically, but as great practice in every art leads to improvement, so in this case have the MESSRS. WEEKS found it desirable to replace these seven boilers by one. This one will heat every house and pit efficiently, either altogether or separately, according to pleasure. This alteration will effect a very important saving annually, as the one boiler will not consume more than two out of the seven boilers superseded, whilst the time and labour hitherto expended over the seven, will in future be confined to one. The necessary alterations for this important arrangement are now in progress, and will be completed within a fortnight, and the Nobility and Gentry interested in the principle of heating by Hot Water can here see it practically carried out, and have it thoroughly explained in all its details.

JACKSON'S PATENT PREPARATION FOR THE PRESERVATION OF POTATOES, SEEDS, &c.—This valuable discovery, for which letters patent have been obtained, is the successful result of 14 years' study and experiments in the preservation of vegetable matter. It imparts health and vigour to the Plants and Seeds subjected to its action, and effectually prevents the Potato Disease, the Smut in Wheat, Mildew and Rot, all Fungal Diseases, and the attacks of Insects and Vermin, and further recommends itself to the Farmer, the Planter, and the Public generally, by the extreme simplicity of the mode of its application.
It is sold by all Seedsmen and Chemists, in packets of one, two, three, and four pounds each, with instructions for its use; and parties requiring larger quantities for their own use or for exportation can be supplied on advantageous terms, by addressing Mr. JACKSON, the Patentee, 18, Cannon Street, London Bridge; where the article is always on sale, and the fullest particulars and directions for its use can be obtained.

DEANE, DRAY, AND CO., have a very large and superior stock of FRENCH MODERATOR LAMPS now on sale.—(Opening to the Monument), London Bridge.
ESTABLISHED A.D. 1700.

UMBRELLAS.
DAWSON'S PATENT.—If you require an Umbrella that is superior in every respect to any other made, being not only waterproof, but at least five times more durable, and, according to its quality, equally low in price, ask for, and insist upon having, DAWSON'S PATENT WATERPROOF.
Wholesale Warehouse, 9, King's Arms Yard, Moorgate Street.

GLENFIELD PATENT STARCH, used in her Majesty's Laundry, and WOTHERSPOON'S machine-made CONFECTIONARY, MARMALADE, JAMS, JELLIES, &c., which gained the Prize Medal of 1851, may be had of all Grocers; Wholesale of WOTHERSPOON, MACKAY, & Co., 66, Queen Street, Cheapside, London; and ROBERT WOTHERSPOON & Co., Glasgow

WOOD ENGRAVING.
ILLUSTRATIONS FOR BOOKS, PERIODICALS, MANUFACTURERS' CATALOGUES, and every class of Wood Engraving in a superior style, at reasonable prices, by GEORGE DORRINGTON, Designer and Engraver on Wood, 4, Amptor Street, Gray's Inn Road.—Specimens and Estimates post free.

TO NERVOUS SUFFERERS.
A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Address the Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

THE SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The Fifth Exhibition of Flowers of the above Society will be held at the HORNS TAVERN, KENNINGTON, on Tuesday, the 19th September, 1854, when Prizes will be awarded for Miscellaneous Plants, Dahlias, including Fancy varieties, Verbenas in Pots, and Cut Blooms.

An efficient Band will be in attendance.

Members and Honorary Members of the Society, and their Two Free Tickets, will be admitted to the Rooms from 2 till 6 o'clock. Admission to Non-Members 1*s.* each.

The last Exhibition for this season will also take place at the Horns Tavern, Kennington, on Wednesday, the 22d November, for Chrysanthemums.

List of Prizes, and the Rules of the Society, may be obtained from JOHN BUSHELL, Esq., Hon. Sec., *pro tem.*, Lower Kennington Lane, Lambeth.

TO DAHLIA GROWERS.

NORFOLK AND NORWICH HORTICULTURAL SOCIETY.—The DAHLIA SHOW will be held at the Corn Exchange, Norwich, on THURSDAY, the 14th of September next, immediately after the morning performances at the Musical Festival. Amongst others, Prizes of 5*l.*, 3*l.*, and 2*l.* will be offered for 24 dissimilar DAHLIA BLOOMS (Fancies excluded), open to all Nurserymen and such Amateurs as are subscribers. No entrance fee.

ARTHUR PRESTON,
Norwich, Sept. 9. Hon. Sec.

NATIONAL DAHLIA EXHIBITION, under the auspices of the Nottingham Horticultural Society, will be held in Nottingham, together with the Fourth Exhibition of the Nottingham Horticultural Society, on WEDNESDAY, the 13th September, when five Silver Cups and numerous other prizes will be awarded. Schedules may be had by enclosing a postage stamp to S. R. P. SHILTON, Honorary Secretary, Nottingham.

LISIANTHUS RUSSELLIANUS.

J. AND J. FRASER beg to offer the above, in strong and healthy plants, such as will make large specimens for flowering next season, at 2*s.* 6*d.* each.

Lea Bridge Road, Essex, September 9.

CHRYSANTHEMUMS.

J. AND J. FRASER have a very superior Collection of the above, comprising the newest and best of Large-flowering and Lilliputian varieties. The plants are very strong, and will bloom well in the ensuing winter.

Lilliputians, fine plants ... ... 9*s.* to 12*s.* per doz.
Large flowering ... ... 9 to 12*s.* „
New French varieties of 1854, not yet bloomed in this country ... ... 18*s.* „

Lea Bridge Road, Essex, September 9.

SEEDS OF CALCEOLARIA AND CINERARIA.

E. G. HENDERSON AND SON, of the Wellington Nursery, St. John's Wood, London, are now prepared to forward, by post, the new Seed saved this year from their unrivalled collection, in packets at 5*s.* 6*d.* and 3*s.* each.

The CALCEOLARIA, first quality ... ... 5*s.* 0*d.*
„ second „ 2 6

QUALITY, and not QUANTITY, forwarded at the above prices.

STRAWBERRIES.

J. HARGREAVES is now sending out Strong Plants of the four new Strawberries, viz., Ajax, Ruby, Captain Cook, and Fillbasket, at 10*s.* per hundred, or 25 each of any two sorts for 6*s.*, package included; also, all the old sorts at 3*s.* per hundred.—Address, JOHN HARGREAVES, High Street Nursery, Lancaster.

STRAWBERRIES.

BARRATT'S MAGNUM BONUM.—In size, this splendid Strawberry very far surpasses the "British Queen," is an exceedingly heavy cropper, and continues in perfection later than almost any other variety. Its flavour is really delicious, most nearly approaching the true Pine Apple of any kind yet known. Price per 100, 2*l.* 2*s.*; per dozen, 6*s.* Good strong Plants of the above are now ready for sending out by

St. John's Nursery, Wakefield. WM. BARRATT.

N.B. W. B.'s List of 40 kinds of Strawberries may be had gratis.

STRAWBERRIES, 3*s.* per 100.—Strong well-rooted runners are now ready. British Queen, Eleanor, Prolific, Kitley's Goliah, Cuthill's Black Prince, Princess Alice Maude Myatt's Hautbois, Rivers' Eliza, &c.

BASS AND BROWN, Sudbury, Suffolk.

"OMAR PACHA" STRAWBERRY.

WILLIAM JAMES WARD is now sending out well rooted plants of the above excellent Strawberry, which was awarded a Medal by the judges at the Royal Botanic Gardens Exhibition, July 5th, 1854. It has also been submitted to Mr. Marnock, Mr. Spencer, Mr. Thompson, and several practical gardeners, who have all pronounced a favourable opinion of it. Also by Mr. Powell, of the Royal Gardens, Frogmore, in the descriptive list of new Fruits, in the "Florist and Fruitist" for the present month, accompanied with a woodcut.

Prospect Hill, Reading.—9th Sept., 1854.

REAL GENUINE SEEDS.

H. KNIGHT, SEEDSMAN, Seaford, Sussex, will send any of the following extra choice Seeds, post-free, to any address, on receipt of postage stamps to the amount in sealed papers.

CALCEOLARIA, from the same stock that gained the Prize, open to all England, at Brighton last June; 1*s.* 6*d.* and 2*s.* 6*d* per paper.

ANTIRRHINUM, 70 kinds, 1*s.* PANSY, 100 kinds newest, 1*s.*; ditto from newest fancy kinds, 1*s.*

HOLLYHOCK, 50 kinds, 1*s.*

HOLLYHOCKS.—A collection of this fine old English flower, grown at the Cheshunt Nurseries, is now in bloom, and there will be a succession till the end of October. Admirers of the Hollyhock are respectfully invited to visit the Nurseries to inspect them. In addition to the choicest varieties of other growers, there are many rare and beautiful kinds of their own production, and to be seen only at their grounds.—A. PAUL & SON, Nurseries, Cheshunt, Herts (13 miles from London, on the Cambridge line of Eastern Counties Railway).

NEW BROWN COS LETTUCE SEED,

FOR PRESENT SOWING.

SUTTON AND SONS, Reading, have just harvested some of their choice sort of BROWN COS LETTUCE for sowing now to stand the winter. Price 1*s.* per packet. Excellent Cauliflower, Onion, Spinach, &c., for autumn sowing.

BULBS FOR WINTER BLOOMING.

GOOD HYACINTHS, JONQUILS, CROCUSES, &c., for sale, at moderate prices, by the Importers.

MESSRS. SUTTON AND SONS, Seed Growers, Reading.

GRASS SEEDS.

SUTTON AND SONS *recommend the sowing of* GRASS SEEDS *at this season for Permanent Pasture, and are now prepared to supply excellent fresh Seeds for the purpose at very moderate prices.*

Also New Italian Rye Grass and Trifolium incarnatum, at moderate prices.—JOHN SUTTON & SONS, Seed Growers, Reading.

CHOICE CALCEOLARIA SEED.

JOHN AND CHARLES LEE beg to state, they are now sending out packets of choice Calceolaria Seed, saved from a very SUPERB COLLECTION, price 2*s.* 6*d.* per packet.—Vineyard Nursery, Hammersmith.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE begs to announce that a small quantity is still on hand of his superior seed of the above. For description see *Gardeners' Chronicle*, July 29 and August 5. Packets 2*s.* 6*d.* each, payable in postage stamps.

Streatham Place Nursery, Brixton Hill, near London.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out new seed of this year's saving, which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each; also a few packets of choice Cineraria Seed at 1*s* 6*d.* and 2*s.* 6*d.* each. Primula sinensis, all saved from fringed flowers, 1*s.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.—Sept. 9.

LILIUM LANCIFOLIUM, TRITONIA AUREA, AND VALLOTA PURPUREA.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY THE QUEEN, AND TO HIS MAJESTY THE KING OF SAXONY, begs to say that his extensive collection of the above BEAUTIFUL PLANTS is now in flower, and may be viewed every day (Sundays excepted). Admittance gratis.

DUTCH FLOWER ROOTS JUST IMPORTED.

JAMES CHARTRES AND CO. beg to draw the attention of purchasers of the above to their establishment, where they can be supplied with the finest BULBS at the lowest possible prices, they are remarkably fine this season, more especially Hyacinths, Tulips, Narcissus, &c. A Catalogue will be sent on application.

J. C. & Co. have a large stock of choice Chrysanthemums (show varieties), which they can supply at 6*s.* per dozen.

Seed Warehouse, 74, King William Street, City, London.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen. The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

HUGH LOW AND CO. would inform their friends and customers that they are now receiving their BULBOUS ROOTS from Holland. The collection comprises all the kinds of Roots suitable for early forcing, and they have been selected with care from the leading houses in Haarlem. Any orders entrusted to them will have every attention, and they feel satisfied they are in a position to supply them to the satisfaction of their customers.—Clapton Nursery.

TORREYA MYRISTICA (CALIFORNIAN NUTMEG) —The SUBSCRIBERS have to offer strong healthy plants, three years from seed, of the above-named beautiful hardy Evergreen Tree. It is figured and described by Sir W. J. Hooker, in "Botanical Magazine" for May, 1854, to which the Subscribers refer their friends. Price on application.

HUGH LOW AND CO., Clapton Nursery, London.

CHRYSANTHEMUMS.

R. PARKER begs to offer fine bushy plants of the above, well established in 6-inch pots, for flowering this autumn, consisting of all the newest and finest Pompon and large flowered varieties in cultivation. Purchaser's selection at 9*s.* per dozen. A list of names forwarded upon application.

CINERARIAS (Seedlings), from all the finest varieties, carefully selected, including the new varieties sent out last autumn. Established plants, in 3-inch pots, at 3*s.* per dozen.

A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, Islington.

EARLY DWARF SEED POTATOES.

ABRAHAM HARDY AND SON'S Ten selected earliest varieties of SEED POTATOES are now ready to send out, warranted free from disease. Retail and trade prices on application.

Also their improved BATH COS and Hardy HAMMERSMITH LETTUCE SEED, growth of 1854. Six-pennyworth of these, or other seeds of Cauliflower, Flower Seeds, &c., for September sowing, will be sent to any address, post free, on receipt of 6*d.*, or six stamps. Price per pound to the trade, on application.—Maldon, Essex, September 9.

MAY'S IMPROVED EARLY ASH-LEAVED KIDNEY POTATOES FOR SEED.—For autumn and early spring planting the above are the best variety of Ash-leaved Potatoes known; the following opinion of them is from a party who has grown them for some years, and is selected from a number of favourable opinions of them:—"I can truly say, from a number of years' experience in growing them, that I never met with any Potato to equal them for cropping and sale."—*George Keynon, Market Gardener, Bricrley, near Wakefield.*

STRAWBERRIES.

WILLIAM NICHOLSON is now sending out strong, well-rooted plants of his four new and distinct STRAWBERRIES, viz., AJAX, a very fine large dessert fruit, very beautiful, solid, and juicy RUBY, do., a great bearer, and forces well. CAPTAIN COOK, market fruit, large, and a great bearer. FILLBASKET, do. 15s. per 10's, or 25 each of any two sorts for 10s., box included. Most of the best old and new sorts can be supplied on reasonable terms. See advertisement July 15. Post-office orders payable at Yarm, Yorkshire, or a cash remittance required with the order.

Egglescliffe, near Yarm, Sept 9.

MYATT'S new Seedling Strawberry, "ADMIRAL DUNDAS."—This is the most extraordinary variety, for size and productiveness, that has yet been raised at Manor Farm: it is much larger and a better flavour than either the Surprise or Mammoth, and ripens off the late fruit to advantage.

J. M. & Sons can confidently recommend it as being superior to any large variety that has come under their notice.

Strong, well-rooted runners are now ready, and will be carefully packed and delivered free to any part of London, at the following scale of charges:—100 50s.: 50, 20s.: and 25, 16s. Also strong Plants of MYATT'S British Queen, Cinquefoila, Eleanor, Surprise, Globe, Eliza, Hooper's Seedling, Keens' Seedling, Black Prince, and Barnes' Bicton Pine, 5s. per 100.

Manor Farm, Deptford, September 9.

NEW CINERARIAS.

ROBERT REA begs to announce that he will send out, the first week in October, the following New CINERARIAS, and, from their first-rate character, and being unequalled by any yet sent out, he feels confident they will give universal satisfaction.

IPSWICH BEAUTY (REA's).—Clear white, deeply edged with lake, shaded with purple; very dark disc, full size; broad petals, slightly cupped. A fine exhibition flower. First Class Certificates were awarded at Ipswich and Colchester, the only places where it was exhibited. Pronounced by all who saw it to be the finest Cineraria ever exhibited. Plants 10s 6d. each.

GEM (PARKER's).—A self-coloured flower; beautiful puce, with light disc; quite novel in colour, and a very striking first-rate variety. First Class Certificate, Ipswich, 1853. Plants 7s. 6d. each.

In consequence of having only one plant of the first to propagate from, the stock is very limited, early orders are therefore respectfully solicited, which will be executed strictly in rotation as received. The usual discount to the trade, and one sent over when three are ordered.—Ipswich Nursery, Ipswich. Sept. 9.

BASS AND BROWN are now saving several of their choice Seeds, and can strongly recommend the following, which have been selected with their usual care from their superb collection:—

CALCEOLARIA, very choice, 1s.: extra superb ...	2s. 6d.
CINERARIA, very choice, 1s.: extra new and choice	2 6
FUCHSIAS, from new and choice	1 0
GERANIUM, very choice, 1s: extra new and choice	2 6
from finest fancy varieties	1 6
GLOXINIA, fine, 6d. extra from new and choice ...	2 6
ANTIRRHINUM, choice, 6d. extra from superb flowers	1 0

A List of Choice Seeds selected for Autumn sowing may be had free by post on application.

Post-office orders to be made payable to BASS & BROWN, or STEPHEN BROWN. Penny stamps received for small amounts.

Seed and Horticultural Establishment, Sudbury, Suffolk.

ARTHUR HENDERSON AND CO. beg to inform their patrons and the public that their CATALOGUES OF BULBS are now ready, and they will have much pleasure in forwarding them on application.

They comprise lists of all the finest varieties of Hyacinths, and many other rare and valuable Bulbs.

Their collections of Hyacinths have yearly carried off the metropolitan prizes, not only for their unique growth, but also for their beauty of colouring and distinctness of sorts, either when exhibited in a collection of 36 plants or in pairs.

Pine-apple Place, Edgeware Road, London.

TO PLANT GROWERS, NURSERYMEN, AND OTHERS.

WANTED, a few fine Large PLANTS of the undernamed, not less than 8 feet high, or any other good Greenhouse Plants not named below.

Banksia grandis	Edwardsia, sorts
" latifolia	Telopea speciosissima
" coccinea, &c.	Orange trees
Calothamnus, of sorts	Lemon, &c.
Poinciana Gilliesii	Sparmannia africana
Pittosporum, sorts	Beaufortia decussata
Enkianthus reticulatus	Pimelea lanata
" quinquiflorus	Luculia gratissima
Lambertia formosa	" Pinceana
Grevillea, sorts	Dryandria, sorts
Eucalyptus, sorts	Cunonia capensis
Burchellia capensis	Hovea Celsi
Brugmansia, sorts	Myrtles, sorts

Any one having any of the above to dispose of may hear of a purchaser by stating the names and price, and any of the particulars to A. B., to the care of Mr. Thomas Goodwin, Helmsley Place, Hackney, London.

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

CHRYSANTHEMUMS, LILIPUTIAN AND LARGE FLOWERING.—Large and remarkably fine Plants of all the best Sorts, in 32-sized pots, fit to make really good Specimens at once, at 18s. per dozen: smaller Plants, in 48s, to flower in the coming winter, at 9s. per dozen.

VERBENAS.—All the new Varieties let out by Smith, Bragg, Mockett, and others, in 1854, at 8s. per dozen; older Varieties, 6s. per dozen—all well established.

FAIRY AND FABVIA ROSES.—Large healthy Plants, in 48s, at 8s. per dozen.

SEEDLING HERBACEOUS CALCEOLARIAS, AND SEEDLING CINERARIAS, at 5s. per dozen in October. These Plants have been raised from the Flowers which were so highly admired at this Nursery during last season.

FRENCH SPOTTED OR NEW FANCY GERANIUMS.—Well-established Plants of these beautiful Flowers, at 2s. 6d. each, or 25s. per dozen, in October next—a large consignment (including all the best raised in France, several of which have not been seen in England, having been just received at the Floral Nursery.

An immense stock of nearly all the new and best Bedding GERANIUMS, FUCHSIAS, HELIOTROPES, TROPÆOLUMS, and other Soft-Wooded Plants, always on hand, at prices equally low.

The Stock of SHOW and FANCY GERANIUMS at the Floral Nursery is unquestionably the largest and best in the kingdom, no expense having been spared to render it perfectly unique: all the new plants of the best raisers are added as they appear. Well-established plants of upwards of 1000 sorts may be had early in October next, at prices which will place competition at defiance.

The trade fairly and liberally dealt with, and all plants sent out will be warranted true to name.

A remittance or satisfactory reference indispensable from unknown correspondents. Catalogues forwarded gratis.

JOHN WESTWOOD, PROPRIETOR.—Sept. 9.

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

PELARGONIUMS.—The undermentioned have been selected from upwards of 1200 named sorts. The whole stock (including all the newest and best Show, Fancy, Scarlet, and other Bedding kinds) consisting of upwards of 150,000 plants.

A comparison of the prices named will at once show how very far they are below all others. The quality of the plants will prove equally satisfactory.

SHOW GERANIUMS.—Carlos, Empress, Leah, Majestic, Rosa (Foster's), Regalia, Sanspareil, Virginia, Zeno, Neatness, Picta, Rebecca, Marginata, Eliza, &c. 5s. each, or 48s. per dozen.

Optimum, Pilot, Queen of May, Glow-worm, Indian Chief, Leonora, Pasha, Sunrise, Vulcan, Calpe, Hylas, Splendidum, Portia, Novelty, Commander, Incomparable. 2s. 6d. each, or 25s. per dozen.

Annie Laurie, Astrea, Basilisk, Butterfly, Capella, Charming May, Colonel of the Buffs, Cordelia, Cœur de Lion, Eleanor, Gertrude, Jupiter, Hulla, Magnet, Alderman, Medora. 1s. 6d. each, or 15s. per dozen.

FANCY GERANIUMS.—Bribette, Bellinzona, Constance, Conqueror, Dandy, Lady Alice Peel, Lady Hume Campbell, Madame Sontag, Macranthum, Madame Staub, Mary Howitt, Empress of France, Illuminator, Magnum Bonum, Ocean Queen, Beauty of Blackheath, Figaro, &c. 3s. 6d. each, or 40s. per dozen.

Autumna, Argus, Bouquet de Venus, Ceres, Darling, Duchess of Sutherland, Megæra, Ossa, Charles Dickens, Conspicuum, Marco Polo, Mirandum, Lady Mary Labouchere, Victoria Magna, Cassandra, &c. 2s. each, or 21s. per dozen.

All the above are now ready to send out. See also preceding advertisement.—JOHN WESTWOOD, Sept. 9.

"SIR HARRY."—The eminent success of this new SEEDLING STRAWBERRY, at the only Floral and Horticultural Exhibitions where it has been shown, viz., Chiswick, first-class Certificate: 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize—induces the proprietor (hitherto an amateur grower only) to offer it for sale.

The characteristics of the plant are these:—Ripening as early as Keens' Seedling, but continuing fruiting a much longer time—a great cropper, bearing a very large handsome dark crimson berry, which carries that superb colour not only quite through, but to its very end, whilst, being both firm and juicy, it separates itself entirely from its calyx, without having a tasteless core. The delicious and luscious flavour of the fruit, united with its high perfume, throws utterly into shade the Keen and British Queen. The leaves are few, and the vigorous extension of its bearing branches exposes the fruit to the ripening influence of the sun, the want of which exposure is a great cause of failure in many sorts of this class of plant.

An oil-painting of a one-year-old runner, with its gigantic fruit in the respective stages of growth (as sketched from nature), is now to be seen in the Birmingham Exhibition of the Society of Artists, and coloured Lithographs have been taken from it by an eminent London Artist, which may be had on application, price 2s. 6d. each, in postage stamps.

The Plants will be ready for sending out (not less than a score) on the 20th September next. Prices—100 plants, 6l.; 80 plants, 5l. 10s.; 60 plants, 4l. 4s.; 40 plants, 2l. 17s; 1/ 10s. for a score. A few plants in pots may be had. Apply to MR. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham; each application to be accompanied with a Post-office order (on Birmingham) or cash, to receive attention.—September 9.

NEW HARDY CONIFERS.

HUGH LOW AND CO. announce to their friends and the public that they have been appointed by Messrs. Parsons & Co., of Flushing, New York, Sole Agents in this country for the sale of the undernamed CALIFORNIAN CONIFERS. The Plants are raised from seed, and will be delivered as soon as the growth of the present season is sufficiently matured.

Thuja gigantea (Nuttall).	Thuja Menziesi (Douglas).
Libocedrus decurrens (Torrey).	" Craigiana (Jeffreys).

A magnificent species, and the most desirable Tree known to exist in California. It was discovered by the botanists of the United States Exploring Expedition, and is described by Professor Torrey, in "Plantæ Fremontianæ," as growing near the upper waters of the Sacramento, from lat. 38° 40 to 41° N. He also states it is a noble tree, attaining a height of 120 to 140 feet, with a trunk 7 feet in diameter, rising from 80 to 100 feet without a limb. This tree will be perfectly hardy, and will take the foremost rank amongst our ornamental trees, as the foliage is most beautiful, reminding an observer of some of the more graceful species of Lycopodium.

The Plants when delivered will average 1 foot to 1½ foot in height, and being of such unusual size for a new Conifer, will produce an immediate effect. Price 31s. 6d. each.

ABIES NOBILIS.—This well-known Fir requires no description. Plants from seed have long been desiderata, and those now offered are strong and well shaped, from 6 inches to 1 foot in height. Price 31s. 6d. each.

In addition to the above, H. L. & Co have to offer from the same source strong Plants of several species of hardy CALIFORNIAN PINES, collected in districts little explored. Amongst them will be found Pinus Jeffreyana, Pinus Parryana, offered for the first time; and judging from the CONES of the different species, it may with certainty be inferred that several will prove entirely new to this country. Price 84s. per doz.

Messrs. Parsons & Co. having been successful in raising these fine Conifers in considerable numbers, have determined on offering them at the low prices quoted above, with a view to insure their speedy introduction into every collection in Europe.

Discount allowed only when twelve plants of a sort are taken.

Clapton Nursery, London, Sept. 9.

RARE AND HARDY CONIFERÆ.

THE following CONIFERS having proved perfectly hardy during the past winter and spring in this well-known bleak district, exposed to the cutting winds from the North Sea, induces YOUELL AND CO. to offer the same with every confidence, and beg to annex a scale of prices for good Plants.

Wellingtonia gigantea			

All orders of £2 and upwards are delivered carriage free to London, Hull, and Newcastle on-Tyne, as well as to any Railway Station within 150 miles of the Nursery. Communications by Steamers and Railway to all parts of England, Ireland, and Scotland, as well as the Continent. Post-office Orders to be made payable to YOUELL & CO.

ROYAL NURSERY, GREAT YARMOUTH.

THE BEST PLANT OF THE SEASON.

"BEGONIA PRESTONIENSIS SUPERBA."

W. J. EPPS has much pleasure in stating that he has purchased this splendid Begonia raised by Mr. Frost, Gardener to E. L. Betts, Esq., Preston Hall; the flowers are of much brighter colour than Prestoniensis, and the centre is nearly filled with stamens and petals, resembling a double blossom with a golden tinge, exhibiting a charming contrast. The flowers are delightfully fragrant as a Tea scented Rose. Habit—dwarf and bushy; the flowers are thrown well above the foliage, in large trusses, and altogether one of the best plants yet offered. It received the highest award in June, at the Royal Botanic Show, Regent's Park, as a new plant: also at Maidstone and Ashford. Plants in October, 10s. 6d. each; one given where three or more are taken.—Bower Nurseries, Maidstone, Sept. 9.

HOLLYHOCKS, DAHLIAS, AND DUTCH BULBS.

GARAWAY, MAYES, AND CO. beg to call the attention of Florists, and the Public generally, to their large collections of HOLLYHOCKS and DAHLIAS, which comprise all the newest and choicest varieties in cultivation, and are now coming into full bloom, and which they will be happy to show to all interested in these favourite Plants. Their Hollyhocks this season are particularly fine, and in addition to their collection of named varieties, they have an unusually fine batch of Seedlings, from seed sown in the spring of 1853, now in bloom.

G. M. & Co. also beg to announce that they are now receiving their annual consignment of BULBS from Holland, comprising Hyacinths, Tulips, Crocuses, &c., which are this year in good condition and moderate in price.

Priced Catalogues of Dahlias, Hollyhocks, and Dutch Bulbs may be had on application.—Durdham Down Nurseries, Bristol.

THE PAST WINTER AND SPRING have induced YOUELL & Co. to publish a CATALOGUE of RARE and HARDY CONIFERS and HARDY ORNAMENTAL SHRUBS, that have proved with them perfectly hardy in this well-known bleak district, exposed to the cutting winds from the North Sea.

This Catalogue also contains an extensive selection of the most useful Greenhouse Plants, Camellias, Ericas, Epacris, Chrysanthemums, Hollyhocks, Tree Carnations, Carnations and Picotees, Fuchsias, Verbenas, Phloxes, &c., which will be forwarded (stamped) on receipt of two postage stamps.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

NEW FUCHSIAS, VERBENAS, AND PETUNIAS OF 1854 AT REDUCED PRICES, with other NEW and SELECT PLANTS.

For BASS AND BROWN'S Advertised Lists of the above, see *Gardeners' Chronicle* of July 22 and 29, and August 5.

SUPERB NEW CHRYSANTHEMUMS.

12 best new Pompone varieties of last season ... ... 12s.
10 best new large flowering do. do. ... ... 10s.
60 splendid varieties of Pompone and large flowers, including new, 40s., or, per dozen ... ... 9s.

These are all fine and strong for flowering.

Catalogues free for three penny stamps. Post-office orders payable to BASS & BROWN, or to STEPHEN BROWN, Post Office, Sudbury, Suffolk.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 9, 1854.

THE last winter has enabled us to judge more correctly than before of the effects of as low a temperature as we usually experience, even in extreme cases, upon most of the NEWLY INTRODUCED TREES AND SHRUBS. From information communicated to the *Gardeners' Chronicle*, and from several other sources, the Horticultural Society have been able to cause an instructive return to be prepared, which is published in the number of their journal just out. It is needless to say that this is a subject of the highest interest to the innumerable lovers of "hardy" plants, who spend large sums of money upon their acquisition, and who are greatly annoyed when the assurances that they have received of a costly plant being certainly quite hardy, prove to be fallacious.

To be hardy, in the proper sense of the word, a tree must be able to bear not only our ordinary winters, which are remarkable only for their mildness, but those instances of much lower temperature which are certain to occur every 10 or 15 years, and of which we have no previous warning.

The question of hardiness is by no means easy to determine conclusively. Mere identity of temperature does not indicate identity of climate; the thermometer may fall to zero in two places, of which one has a warm, dry, well drained soil, the other a cold, damp, heavy soil, and plants will escape in the first which perish in the last. A great variety of analogous circumstances, unobserved, and perhaps inappreciable, assist in complicating the matter, so that, for absolute exactness, each species of tree would require to be made the subject of a dissertation. But life is too short for us to wait for elaborate inquiries, and we must be satisfied with such an approximation to truth as can be readily obtained. The most satisfactory way of arriving at such truth is by obtaining returns from many different places, in different situations, and comparing the evidence relating to each new species with that collected in the same places concerning well-known plants now familiar in all gardens. To say that a species will bear an ordinary winter is too vague an assertion to be useful. To say that it is as hardy as an evergreen Oak or a Sweet Bay, or a common Laurel, is intelligible to every one. The memoranda published by the Horticultural Society furnish data for such a comparison, which every reader can make for himself. Our limited space only enables us to give the result of the inquiry as regards a few of the more interesting cases.

Among the true PINES it may be regarded as certain that in all places, except the warm south and south-western districts, the following are too tender to be worth planting, viz.: *Devoniana*, *Grenvillæ*, *filifolia*, *leiophylla*, *ayacahuite*, *Hartwegi*, *patula*, *Teocote*, *Russelliana*, *canariensis*, *Massoniana*, *Wincesteriana*, *Gordoniana*, *halepensis*, *sinensis*, *Orizabæ*, *occidentalis*, and *pseudo-strobus*. On the other hand, the hardy constitution of the following seems to be established, viz.: *Llaveana*, *Gerardiana*, *tuberculata*, *palustris*, *radiata*, *macrocarpa*, *Benthamiana*, *Lindleyana*, *Fremontiana*, *muricata*, *Montezumæ*, *Ayacahuite*, *cembroides*, *osteosperma*, *Peuce*, *persica*, and *Brutia*. With regard to *P. insignis* the evidence is conflicting; there is a circumstance, indeed, within our own knowlege which is inexplicable; in the garden of the Horticultural Society were two good sized specimens, one rather younger than the other; the former sheltered partially by a wall, the latter as much or more sheltered by a conservatory; the younger died, the older sustained no injury: so again at Congleton, some are returned killed, others as having escaped; at Ossington, where the Sweet Bays perished, this plant was uninjured, and it is returned by Mr. LOWE, of Nottingham, where the frost was more intense than elsewhere, as being merely "injured." We incline to regard the plant as hardy after it is eight or nine years old.

Of SPRUCES the following seem hardy, viz., *Abies Smithiana*, *Morinda*, *orientalis*, and all the Oregon kinds; but *A. Brunoniana* is undoubtedly tender.

Among SILVERS and their allies, *Abies Pinsapo*, *Webbiana*, *jezoensis*, *cephalonica*, *Nordmanniana*, and *Pichta* are hardy; on the contrary, *A. religiosa* will not stand.

All LARCHES except *Griffithi* seem to be hardy.

The *Cedar of Lebanon* represents sufficiently the constitution of other CEDARS; the reports respecting the Deodar are much the same; in both cases plants have died, or suffered, or escaped. Practically we may regard the Deodar when old and well established, quite as hardy as the Cedar of Lebanon; when young it grows so fast as to be more susceptible of very severe spring frosts. Thus when the thermometer fell to 18°, on the 24th of last April, the young Deodars were in full growth in Mr. GLENDINNING'S nursery, at Turnham Green, and nearly all perished. The young wood of the common Walnut was killed at the same time.

Among CYPRESSES, *Cupressus funebris* appears to be unsuited to Nottinghamshire and the counties to the North, probably because it has not summer heat enough; the same may be inferred of *C. Uhdeana*, *Govcniana*, *torulosa* and *thurifera*; *C. macrocarpa* appears to be more hardy, for no plant was quite killed even at Ossington, and at Oulton it sustained little injury. On the other hand it is returned by Sir OSWALD MOSLEY among his killed. We have some hope that all these Cypresses will become hardier as the specimens acquire age; while young they grow so fast and so late as to be peculiarly susceptible of cold.

The returns relating to JUNIPERS show how little they are cultivated. It, however, appears certain that *J. excelsa*, *squamata*, *recurva*, *chinensis*, *japonica*, and *mexicana* are hardy; and *Bermudiana*, *tetragona*, and *Bedfordiana* unmistakeably tender.

Among other Coniferous plants, ARAUCARIA *imbricata* has suffered far more than was expected, and evidently will not bear the climate of Derbyshire and the bordering counties; this is a very unexpected result; it seems also to be ascertained that in a climate that suits it it will bear well exposure to the sea, a quality of which those who live on the coast, where there is no chalk, will do well to avail themselves. The other *Araucarias* are not worth further trial. All species of CALLITRIS are tender. All the CEPHALOTAXI are as hardy as Yews; a great discovery, considering how handsome these evergreens are. CRYPTOMERIAS, when in health, suffer nothing; even the fine variety Lobbi, obtained from the Dutch Botanic Garden at Buitenzorg in Java, was untouched so far north as Cheshire; but unhealthy specimens were turned brown in many places. Concerning CUNNINGHAMIA we have no northern evidence; up to the latitude of London it may be regarded as about as hardy as a Sweet Bay or Magnolia grandiflora. DACRYDIUMS, PHYLLOCLADES and DAMMARS are not worth further trial. Of FITZROYA we have the following account: "Not injured, *Chiswick*; cut back to the main stem, but recovering, *Acton Green*; not affected during the winter, *Bagshot*; stood well, not being injured in the least, *Ware*; leader killed down—supposed to be hardy, *Alton*; unhurt, *Rolleston*; escaped with slight injury, *Congleton*; not hurt, *Exeter*; uninjured, *Singleton*; under a south-east wall, leader killed about 5 or 6 inches, *Southampton*; slightly protected, uninjured, *Bicton*;" we therefore regard it as hardy, the injury it sustained being probably caused by the youth and rapid growth of the specimens. GLYPTOSTROBUS is hardy. LIBOCEDRUS *chilensis* is an unanticipated addition to hardy Conifers; it seems to be undoubtedly as hardy as a Chinese Arbor Vitæ. Concerning the PODOCARPS all remains uncertain; they are worth further trial. RETINISPORAS seem to be tender. Of SAXO-GOTHÆA the reports are contradictory; the following is the return concerning it:—"Is scarcely alive, but not quite killed, although hopeless, *Chiswick*; cut back to the main stem, but recovering, *Acton Green*; not affected during the winter, *Bagshot*; stood well, not being injured in the least, *Ware*; perfectly hardy, *Alton*; unhurt, *Rolleston*; escaped with slight injury, *Congleton*; not hurt, *Exeter*; uninjured, *Singleton*; promises to prove as hardy as any of the Yews, *Bicton*." We hope the Bicton judgment will be confirmed; we know that the plant which died at Chiswick was out of health; and that the specimen at Acton Green, although it had grown very fast and failed to ripen its wood, exhibited no sign of suffering till the thermometer fell to 4°, and was succeeded by a bright morning sun. TAXODIUM *sempervirens* must receive a verdict of hardy, although its leaves and young shoots were nipped and turned brown; the common YEW was as much hurt in some places, especially plants transplanted in the previous autumn. THUJAS, all hardy. About TORREYA *nucifera* there is but one return, from Hampshire, and that is favourable.

Beyond this we cannot go to-day. Next week the returns relating to plants not Coniferous shall be examined.

WHILE waiting for the evidence obtained by Mr. DRUMMOND'S Committee on the WOODS and FORESTS, a parliamentary paper has caught our attention, which shows that the Treasury system in this department of the state is everywhere the same, and that we must expect in all directions the same jobbing, with the same indifference to the interests of the Crown.

In the late session of Parliament the Earl of DONOUGHMORE obtained a Select Committee to inquire into "the management of the Crown estate of Kilconcouse, in the King's County," &c. &c. From the Lords' report and evidence now before us, we learn that this Kilconcouse is a small Irish estate, of something less than 900 acres, the tenants on which, of course, would not pay their rents; that in 1850 they were three years in arrear; and that the late Commissioner, Mr. KENNEDY, after failing to sell the estate, endeavoured to realise something by other means. To effect this, and acting upon the opinion of persons of undoubted competency to advise him, he proposed certain measures, which received in the fullest sense the *approval* of the Treasury, who *commanded* the Commissioner to carry them into execution. Among these measures was the removal of the Rev. FRANCIS M'MAHON, a parish priest, who had acquired some interest in the lands of one DELANY, without the knowledge or consent of the Crown. When Mr. M'MAHON was informed that he must quit possession he made no sort of objection, but begged permission to reap a crop then standing, which permission was granted. This being settled, the *promise of the Crown* was given to DELANY that the priest's holding should be transferred to him upon certain conditions, which conditions he, DELANY, fulfilled. Here was a complete transaction, and one would have supposed that the honour of the Crown would have been considered sacred by every Government officer. Those who think so little understand the Treasury system, as will be seen by the sequel.

After the promise of the Crown had been given to DELANY, the man's house was attacked, in the usual Irish fashion, when he and his wife were "severely assaulted," threatened with death, and so on. It does not appear that the priest had anything to do with the outrage, but it was undoubtedly made in his interest, and with the belief that it would be acceptable to him. The Commissioner immediately communicated with the Lord Lieutenant of Ireland, representing the importance of sustaining the authority of the Crown at all hazards, and the Irish Government forthwith placed a guard of police upon the lands of DELANY.

Although there is nothing to show the complicity of the priest with the outrage, we find that when the Crown required him to quit possession, in order that the land might be transferred to DELANY, he refused to stir, and eventually it became necessary to take legal proceedings to evict him. About this time Messrs. SADLEIR, KEOGH, and other Irish members of that distinguished class, thought fit to support the case of the priest; and eventually, through the instrumentality of Mr. JAMES WILSON, the Secretary of the Treasury, they succeeded in obtaining a reversal of all the proceedings previously taken. And thus was perpetrated an Irish job, the effect of which was to encourage outrage, to stultify both the English and Irish

Governments, and to violate the pledged faith of the Crown. In vain the Commissioner remonstrated; in vain he resisted to the extent of his power; the *fiat* of the Treasury came forth, the Commissioner was commanded to break the promise of the Crown pledged to DELANY, and not only to stay proceedings against the priest, but to continue the priest in possession of the land given to DELANY. We beg it will be observed that this discreditable proceeding could not have taken place without the active concurrence of that very Secretary to the Treasury whose conduct in the removal of the Commissioner who endeavoured to prevent the perpetration of this job has met with such universal disapprobation.

And what was the consequence of this unprecedented conduct? "Then," says Mr. KENNEDY in his evidence, "a curious result arose from this proceeding—another priest got into a very rampant state immediately, in the county of Galway. He wrote me a most insolent letter." Of course he did, and so would every tenant of the Crown as occasion presented itself.

We have purposely omitted a loose heap of matter more or less irrelevant to this case, and under which it is well nigh smothered. It is evidently immaterial whether the priest or DELANY was the better tenant, or whether the priest's demand for compensation was fair or unfair; the real question is, as we have already said, whether or not outrage is to be punished, and the honour of the Crown maintained. To both these Mr. WILSON has given the most emphatic NO he has the power to pronounce. Although the excuses which the honourable gentleman offered the Committee were in no respect to the purpose, yet they are curious, as an example of official fencing. For instance, he thinks the outrage lost all its importance as soon as he had the declaration of the priest that he the priest was not concerned in it; though it was undeniable that the outrage was committed *in the interest of the priest*, and it was cowardly truckling to permit him to profit by it. Then, Mr. WILSON thought the priest *a better* tenant, although he had burnt the very thin land and taken four crops in succession off it, a circumstance denied by no one; so that passing by the honourable gentleman's notions of what improves an estate, we learn, that in the opinion of the Secretary of the Treasury, the promise of the Crown ought to be broken because something is to be got by doing so. And this is the functionary in whose hands Her Majesty's Woods and Forests are now virtually vested: for Mr. GORE, as matters stand, and with the fate of Mr. KENNEDY before him, can be nothing more than a registrar of the will of Mr. WILSON.

There are circumstances connected with the working of Lord DONOUGHMORE's committee by the Government officers which we trust some one will expose. For ourselves, we must refrain from entering upon topics foreign to the purpose of our journal. As much as we have said was necessary, in order to show into what sort of hands the management of the Woods and Forests has been permitted to fall; other questions must, and we hope will, be discussed by others.

VEGETABLE PATHOLOGY.—No. XXXVI.

159. The uniform composition of atmospheric air is mainly secured by the never-ceasing currents known by the name of winds, without which a complete admixture of its component gases would never take place, even supposing that the exhaustion of its several constituents were properly compensated by the vital or dynamical processes which are constantly carried on in nature. A stagnant atmosphere is notoriously incompatible with the health of most animals, but in the case of many vegetables, where no noxious vapours arise from the soil or structures in which they are cultivated, it is not so necessary that the air should be constantly changed, the nocturnal and diurnal absorption and emission of oxygen compensating each other with sufficient exactness to secure the conditions necessary to health. Where, however, plants are grown in frames heated with manure, or where noxious matters are generated by the fuel, a good system of ventilation is absolutely necessary, to set free the superabundant moisture, which is as prejudicial as water stagnating in the soil, and at the same time to regulate the temperature. All ventilation, however, of plants grown under artificial conditions requires caution, as disease is often induced by sudden changes, especially of temperature, disturbing vital action, and thus impairing health. That plants may be maintained in health with extremely slight ventilation is proved by the condition in which many can be maintained in Wardian cases, but in them the probable sources of any great depravation of the air are far smaller than in ordinary systems of culture. We have more than once seen death or inveterate disease arise from the gas produced by decaying vegetable matter introduced into the stove to produce heat, as in the case of fires, or from rotting vegetables placed round a frame, the gas from which found its way inwards, and caused death in a very few hours.

160. One main object of ventilation is to secure such a degree of dryness in the air as may be incompatible with the growth of fungi, for their abundance depends far more upon the humidity of the air than upon the quantity of water which may fall upon the soil in a given locality. If the air be too moist proper evaporation does not take place, the vital powers are depressed, a multitude of little parasites find a fit matrix for the first stages of growth, and a putrefactive process is soon induced which spreads from the immediate seat of the fungus to the other tissues, and the whole plant dies, or is said by gardeners to damp off; and as many kinds of mould flourish at a very low temperature in winter, when sufficient ventilation cannot be secured without depressing the vital energies of the plants too much, these little parasites are under such circumstances peculiarly destructive.

161. On a larger scale, however, ventilation answers a most important end, apart from any effect it may have in driving away noxious gases, or, what amounts to the same practical effect, mixing them so intimately with the general atmosphere as to render their action so extremely small as to be inappreciable. It appears from the observations of Mr. Knight that the motion communicated by wind to vegetables is by no means unimportant as regards the development of wood. Those parts of trees which were so bandaged as almost to prevent motion increased but very little in comparison with those which were exposed to the full action of the wind. The subject has not at present been thoroughly investigated; but it is almost impossible to look on a field of corn, waving like the surface of the sea, without being convinced that the active motion must have a strong influence upon the circulation, without taking into account the increased evaporation which must be consequent on such a rapid change of contact.

162. Noxious vapours seem capable of affecting the roots as well as the free portions of a plant; for, whether absorbed with water or free, they are capable of penetrating, though at different rates, the tender coats of the spongelet; and inasmuch as it appears by the late observations of Mr. Graham * that chemical change always accompanies exosmose and endosmose, at least of non-elastic fluids, the effect of the entrance of such matters as sulphuretted hydrogen, the impure carburetted hydrogen of coal gas, may very soon prove fatal. *M. J. B.*

DR. STOCKS AND MR. BARKER WEBB.

DEATH has been busy among botanists. It is, in the first place, our melancholy duty to announce the sudden death of Dr. JOHN ELLERTON STOCKS, of the Bombay medical staff, one of the most able and promising of Indian botanists, who, at the early age of 34, has been carried off by apoplexy.

Dr. Stocks has long been known both in this country and in India, as a most enterprising traveller and investigator of the natural productions of Scinde and Beluchistan, countries which he indefatigably explored, and in the latter of which he held important posts; first that of vaccinator, and afterwards that of inspector of drugs for the East India Company. In addition to an entensive herbarium, Dr. Stocks had collected materials for a general work on the natural history, manners, customs, arts, and manufactures of Scinde. In this he had made great progress, and his many friends were anxiously looking for its appearance, well assured from the ability and energy of its author, as well as from the novelty of the materials at his command, that it would be a work of very high interest, and of deep importance to all who are interested in the welfare of India.

Dr. Stocks arrived in England on furlough in the winter of 1853, bringing with him a large herbarium of Bombay plants, formed when officiating as inspector of forests during the absence on furlough of Dr. Gibson. These Dr. Stocks brought to Kew, and he took up his abode at that place for the purpose of publishing and distributing them, and of preparing for the press the work mentioned above.

For some years Dr. Stocks had suffered intermittently from severe neuralgic pains in the head and neck, which he attributed to the effects of fever, contracted during his arduous labours in the burning deserts of Scinde. They, however, in reality indicated a serious lesion of the vessels of the brain, which ended in two strokes of apoplexy, which succeeded each other with an interval of very few days, and the second of which carried him off in a few hours. This occurred at the house of a very intimate friend, at Dottingham, near Hull, the place of his birth, whither he had repaired for relaxation, after having completed the arrangement of his herbarium.

Besides being an excellent botanist, Dr. Stocks was a man of great and varied attainments in science and literature. From his childhood his career had been a remarkably promising one, and his friends in the service and in England looked confidently forward to his becoming one of the most useful and sound men of science of his day. To great energy of character, and an indomitable perseverance, Dr. Stocks united a singularly amiable and agreeable disposition, a temper proof against every source of irritation, and an amount of tact and skill in gaining the affection of his servants, and in overcoming the jealousies of the half civilised races amongst whom he travelled, which bore him safely through great dangers and difficulties, both of the climate and the natives. In his intercourse with his brother officers in India, and with his friends of all classes in England, he was no less distinguished for the facility with which he won their regard and esteem; and when to this we add that he was as liberal with his collections as with his information, and had the means and power both of interesting and instructing by his conversation, the severity of his loss to the rapidly diminishing numbers of scientific botanists can scarcely be overrated.

Information has also just reached us of the sudden death of another and very distinguished botanist, PHILIP BARKER WEBB, Esq., well known as joint author with Mr. Berthelot of the "History of the Canary Islands."

Mr. Webb was a native of England, but had resided for many years in Paris, where he was well known as the possessor of one of the largest private herbaria in Europe, and where he enjoyed the society of a large circle of scientific friends.

As a botanist, Mr. Webb was chiefly distinguished by his critical knowledge of South European plants, acquired from personal observation made during extensive journeys in the Mediterranean regions, Spain, Italy, and the Canary Islands. His published works are remarkable for the knowledge of the literature of botany which they display, the classical elegance of the language, and the minute accuracy of his observations, though the latter too often led him to overlook general truths in specialities and to multiply species in an excessive degree.

It is, however, as a most liberal and enlightened patron of botany in all its branches, that Mr. Webb's loss will be most severely felt; he was not only a generous contributor to every botanical traveller, but also the projector of various scientific expeditions, and a charitable friend of all in every case of need. His house was seldom without some young aspirant for botanical fame, who found there a home and occupation when in need of pecuniary assistance.

Mr. Webb's attainments were not confined to botany; he was a most accomplished and elegant scholar and linguist, and added to a highly cultivated intellect an aptitude for conveying his information in the most agreeable and instructive manner. In his intercourse with his fellow-botanists he displayed the most generous appreciation of the labours of all, whilst his amiable disposition, urbane deportment, and freedom from jealousies and distrust of his *confrères* secured him the regard and esteem of the whole corps of botanists in the French capital. Mr. Webb was carried off suddenly by cholera in his sixty-second year.

DESCRIPTIONS OF NEW PEARS CULTIVATED BY M. DE LIRON D'AIROLES, AT LA CIVELIERE, NANTES.—By HIMSELF.

(*Continued from p.* 517.)
